<i>Siosocial Interactions in Modernisation</i> examines a range of major societal problems resulting from the clash between humanity's evolutionary heritage and the biosocial challenges of modern life. The subject matter is organised in reference to the foremost sources of biosocial variation: individual variation, age variation, sexual variation, family variation, reproductive variation, social variation, racial variation, and intergenerational variation.

The analysis of each source of variation begins with a discussion of its biological evolutionary background, followed by an investigation of its variability-specific biosocial interrelations, and concludes with consideration of lessons to be learned about the confrontation between variability-specific evolutionary human heritage and the challenges and adaptive pressures of the novel living environment produced during the modernisation process.

The book relates these key sources of human biosocial variation to maladaptive modern social practices, such as individualism, ageism, sexism, familism, pro/anti-natalism, classism, racism, and dysgenism.<br/>
<br/>
dysgenism.

<i>Biosocial Interactions in Modernisation</i> contributes fresh, original insights to the humanities and social sciences, and also provides a new, vital perspective to anyone with an interest in biology.
