CONWIP

(A pull alternative to kanban principle)

Main resources: Mark Spearman, David Woodruff and Wallace Hopp
Northwestern University,
Evanson, Illinois, USA

Diagrams, modifications, structures and editing (J. Skorkovský, KPH)
Methodologies used for effective production control

• Based on **PULL** principle
  – JIT
  – kanban
  – zero inventory
    • kanban (mostly used for repetitive manufacturing)

• Based on **PUSH** principle
  – MRP (MRP-II)

• Based on both principles (**push** and **pull**)
  – CONWIP (Constant Work In Progress)

greatly reduced inventory levels and production lead times
**PUSH and PULL**

- **PUSH**: production jobs (production orders) are scheduled (MRP nad MRP-II)
  - often not feasible plans are generated and problems are often detected too late
  - used fixed lead times=LT (see next slide) do not depend on capacity utilization
  - Having in mind, that production is random process, LT is very pessimistic

- **PULL**: production jobs (production orders) start are triggered by completion of another job

\[ t = \text{start of the job} \quad \text{and} \quad t + LT = \text{end time of the job (where LT=constant)} \]
Flow time and Lead time

• **Flow time** (known also as a „cycle time“)

Typically random time (highly variable)

- Job is released
- Job is completed

• **Lead time** (constant used for planning)

 Controlling parameters

 Job scheduling (MRP-MRP-II)

 FGI – finished good inventory

 JOB 1

 JOB N
The number of cards in the system determines the WIP levels in the plant.
JIT

- Kanban is not JIT (manufacturing philosophy)

- JIT encompasses:
  - kanban
  - total quality control (TQM) – e.g. scrap loss not tolerated....
  - setup reduction
  - worker participation

- Advantages of JIT philosophy:
  - reduced WIP
  - shorter flow times
  - lower production costs
  - greater customer responsiveness
**PUSH** and **PULL** are not mutually exclusive approaches and other statements...

- **Push** and **Pull** can be combined
- MRP is considered to be more applicable than kanban
- MRP is in almost any discrete part production
- Kanban(JIT, pull) – superior results if applicable
- Kanban(JIT, pull) – is difficult to use if:
  - Jobs with short production runs
  - Significant setup times
  - Remarkable Scrap losses
  - Unpredictable fluctuation in demand
**PUSH** and **PULL** and the types of the queueing networks

- **Push**: open queueing network
- **Pull**: closed queueing network
- **Push**: schedule Throughput and measure WIP

**PULL**: setup WIP and measure Throughput
Advantage of **PULL** over **PUSH**

- **PUSH** : WIP and Throughput fluctuations – result in violation of the assumption, that Flow Times ($FT$) and therefore Lead Times ($LT$) are constant!
- WIP is easier to optimize than Throughput ($T$)
- **Little’s low** :

  \[
  \text{Average } FT = \frac{\text{Average WIP}}{\text{Average } T}
  \]
  
  meaning that $T$ cannot be constant but vary with WIP and $T$

- **Pull is easy to manage** : why? -> WIP is easier to control than capacity needed to appropriately release work in **push** system must be estimated
CONstant Work In Process = CONWIP

• System having benefits of a PULL and can be used in variety of manufacturing environment

• CONWIP : generalized form of Kanban

• CONWIP relies on signals (electronic, paper cards...)
CONstant Work In Process = CONWIP

• **Kanban**: card is used to signal production of a specific part

• **CONWIP**: card is assigned to production line and are not part number specific
CONWIP

Queue (First in system first served = FSFS)
CONWIP parameters

• The card count (it determines the max WIP level for the line) \( = m \)

• Production quota (target production quantity/period) \( = q \)

• Maximum work ahead amount \( = n \) (if \( q + n \) is produced during a period, the line is stopped until the start of the next period)
CONWIP-air traffic control

If heavy air traffic, departing planes should be held on the ground at the originating airport rather than control flying aircrafts in the air above destination airport as a holding pattern.

The results: greater safety and lower fuel consumption.
CONWIP-Theory of Constraints

- Balance the floe and not the capacity

- Operation of the CONWIP line is regulated by the bottleneck resource

- If we have sufficient demand, the correct number of the cards will maintain just enough WIP to keep bottleneck busy
