MANKIW, G. (2010): Macroeconomics. 7th edition. Worth Publishers.

CHAPTER 1 The Science of Macroeconomics

slide 1

- Test 50 questions a/b/c/d (1 correct answer)
- Correct answer +1 p., wrong answer and no answer 0 p.
 - □ A: 50 46 points
 - □ B: 45 43 points
 - □ C: 42 40 points
 - D: 39 37 points
 - □ E: 36 34 points
 - F: 33 points and less

CHAPTER

The Science of Macroeconomics

MACROECONOMICS SIXTH EDITION N. GREGORY MANKIW PowerPoint[®] Slides by Ron Cronovich

© 2008 Worth Publishers, all rights reserved

This chapter introduces you to

- the issues macroeconomists study
- the tools macroeconomists use
- some important concepts in macroeconomic analysis

Important issues in macroeconomics

Macroeconomics, the study of the economy as a whole, addresses many topical issues:

- What causes recessions? Can the government do anything to combat recessions? Should it?
- What is the government budget deficit? How does it affect the economy?
- Why does the U.S. have such a huge trade deficit?

Important issues in macroeconomics

Macroeconomics, the study of the economy as a whole, addresses many topical issues:

- Why are millions of people unemployed, even when the economy is booming?
- Why does the cost of living keep rising?
- Why are so many countries poor? What policies might help them grow out of poverty?

U.S. Real GDP per capita (2000 dollars)

U.S. inflation rate (% per year)

U.S. unemployment rate (% of labor force)

slide 10

Why learn macroeconomics?

2. The macroeconomy affects your well-being.

Why learn macroeconomics?

3. The macroeconomy affects politics.

Unemployment & inflation in election years

year	U rate	inflation rate	elec. outcome
1976	7.7%	5.8%	Carter (D)
1980	7.1%	13.5%	Reagan (R)
1984	7.5%	4.3%	Reagan (R)
1988	5.5%	4.1%	Bush I (R)
1992	7.5%	3.0%	Clinton (D)
1996	5.4%	3.3%	Clinton (D)
2000	4.0%	3.4%	Bush II (R)
2004	5.5%	3.3%	Bush II (R)

Economic models

- ... are simplified versions of a more complex reality
 - irrelevant details are stripped away
- ... are used to
 - show relationships between variables
 - explain the economy's behavior
 - devise policies to improve economic performance

Example of a model: Supply & demand for new cars

- shows how various events affect price and quantity of cars
- assumes the market is competitive: each buyer and seller is too small to affect the market price
- Variables:
 - **Q**^d = quantity of cars that buyers demand
 - **Q**^s = quantity that producers supply
 - **P** = price of new cars
 - **Y**= aggregate income
 - **P**_s = price of steel (an input)

The market for cars: Supply

supply equation:

 $\boldsymbol{Q}^{s} = \boldsymbol{S}(\boldsymbol{P}, \boldsymbol{P}_{s})$

The supply curve

shows the relationship between quantity supplied and price, other things equal.

The effects of an increase in income

demand equation:

$$\boldsymbol{Q}^{d} = \boldsymbol{D}(\boldsymbol{P}, \boldsymbol{Y})$$

An increase in income increases the quantity of cars consumers demand at each price...

> ...which increases the equilibrium price and quantity.

The effects of a steel price increase

supply equation:

$$\boldsymbol{Q}^{s} = \boldsymbol{S}(\boldsymbol{P}, \boldsymbol{P}_{s})$$

An increase in P_s reduces the quantity of cars producers supply at each price...

...which increases the market price and reduces the quantity.

Endogenous vs. exogenous variables

- The values of endogenous variables are determined in the model.
- The values of exogenous variables are determined outside the model: the model takes their values & behavior as given.
- In the model of supply & demand for cars, exogenous: Y, P_s endogenous: P, Q^d, Q^s

A multitude of models

- No one model can address all the issues we care about.
- e.g., our supply-demand model of the car market...
 - <u>can</u> tell us how a fall in aggregate income affects price & quantity of cars.
 - <u>cannot</u> tell us why aggregate income falls.

A multitude of models

- So we will learn different models for studying different issues (*e.g.*, unemployment, inflation, long-run growth).
- For each new model, you should keep track of
 - its assumptions
 - which variables are endogenous, which are exogenous
 - the questions it can help us understand, and those it cannot

Chapter Summary

- Macroeconomics is the study of the economy as a whole.
- Macroeconomists attempt to explain the economy and to devise policies to improve its performance.
- Economists use different models to examine different issues.

CHAPTER •

The Data of Macroeconomics

MACROECONOMICS SIXTH EDITION N. GREGORY MANKIW PowerPoint[®] Slides by Ron Cronovich

© 2008 Worth Publishers, all rights reserved

In this chapter, you will learn...

...the meaning and measurement of the most important macroeconomic statistics:

- Gross Domestic Product (GDP)
- The Consumer Price Index (CPI)
- The unemployment rate

Gross Domestic Product: Expenditure and Income

Two definitions:

- Total expenditure on domestically-produced final goods and services.
- Total income earned by domestically-located factors of production.

Expenditure equals income because every dollar spent by a buyer becomes income to the seller.

The expenditure components of GDP

- consumption
- investment
- government spending
- net exports

Consumption (C)

definition: The value of all goods and services bought by households. Includes:

durable goods

last a long time ex: cars, home appliances

- nondurable goods
 last a short time
 ex: food, clothing
- services
 work done for
 consumers
 ex: dry cleaning,
 air travel.

U.S. consumption, 2006

	\$ billions	% of GDP
Consumption	\$9,268.9	70.0%
Durables	1,070.3	8.1
Nondurables	2,714.9	20.5
Services	5,483.7	41.4

Investment (I)

Definition 1: Spending on [the factor of production] capital.

Definition 2: Spending on goods bought for future use Includes:

business fixed investment Spending on plant and equipment that firms will use to produce other goods & services.

residential fixed investment

Spending on housing units by consumers and landlords.

inventory investment

The change in the value of all firms' inventories. CHAPTER 1 The Science of Macroeconomics slide 31

U.S. investment, 2006

	\$ billions	% of GDP
Investment	\$2,212.5	16.7%
Business fixed	1,396.2	10.5
Residential	766.7	5.8
Inventory	49.6	0.4

Stocks vs. Flows

A **stock** is a quantity measured at a point in time.

E.g., "The U.S. capital stock was \$26 trillion on January 1, 2006."

CHAPTER 1 The Science of Macroeconomics

Stock

Flow

Stocks vs. Flows - examples

stock	flow	
a person's wealth	a person's annual saving	
# of people with college degrees	# of new college graduates this year	
the govt debt	the govt budget deficit	

Government spending (G)

- G includes all government spending on goods and services..
- G excludes transfer payments

 (e.g., unemployment insurance payments),
 because they do not represent spending on goods and services.

U.S. government spending, 2006

	\$ billions	% of GDP
Govt spending	\$2,527.7	19.1%
Federal	926.6	7.0
Non-defense	305.6	2.3
Defense	621.0	4.7
State & local	1,601.1	12.1

Net exports: NX = EX - IM

def: The value of total exports (**EX**) minus the value of total imports (**IM**).

CHAPTER 1 The Science of Macroeconomics

slide 38

A question for you:

Suppose a firm

- produces \$10 million worth of final goods
- but only sells \$9 million worth.

Does this violate the expenditure = output identity?

CHAPTER 1 The Science of Macroeconomics

slide 39

Why output = expenditure

- Unsold output goes into inventory, and is counted as "inventory investment"...
 ...whether or not the inventory buildup was intentional.
- In effect, we are assuming that firms purchase their unsold output.

GNP vs. GDP

Gross National Product (GNP): Total income earned by the nation's factors of

production, regardless of where located.

Gross Domestic Product (GDP): Total income correct by demostically labeled

Total income earned by domestically-located factors of production, regardless of nationality.

(GNP – GDP) = (factor payments from abroad) – (factor payments to abroad)

(HNP – HDP) jako % HDP vybrané země, 2005

ČR: 2010

Phillippines	9.2%
Bangladesh	5.1
U.K.	2.2
U.S.A.	0.3
Mexico	-1.8
Russia	-2.5
El Salvador	-3.4
Argentina	-5.4
Indonesia	-6.5
Panama	-7.3

HNP mld. Kč	3.449
HDP mld. Kč	3.693
Rozdíl % HDP	-7.1

zdroje:

World Development Indicators, World Bank Makroekonomická predikce MFČR

Real vs. nominal GDP

- GDP is the <u>value</u> of all final goods and services produced.
- nominal GDP measures these values using current prices.
- real GDP measure these values using the prices of a base year.

Practice problem, part 1

	2006		2007		2008	
	Р	Q	Р	Q	Р	Q
good A	\$30	900	\$31	1,000	\$36	1,050
good B	\$100	192	\$102	200	\$100	205

- Compute nominal GDP in each year.
- Compute real GDP in each year using 2006 as the base year.

Answers to practice problem, part 1

nominal GDP *multiply* Ps & Qs from same year

- 2006: $$46,200 = $30 \times 900 + 100×192
- 2007: \$51,400
- 2008: \$58,300
- real GDP multiply each year's Qs by 2006 Ps
 - 2006: \$46,200
 - 2007: \$50,000
 - 2008: $$52,000 = $30 \times 1050 + 100×205

Real GDP controls for inflation

Changes in nominal GDP can be due to:

- changes in prices.
- changes in quantities of output produced.

Changes in real GDP can <u>only</u> be due to changes in quantities,

because real GDP is constructed using constant base-year prices.

U.S. Nominal and Real GDP, 1950–2007

GDP Deflator

- The inflation rate is the percentage increase in the overall level of prices.
- One measure of the price level is the GDP deflator, defined as

GDP deflator = $100 \times \frac{\text{Nominal GDP}}{\text{Real GDP}}$

Practice problem, part 2

	Nom. GDP	Real GDP	GDP deflator	Inflation rate
2006	\$46,200	\$46,200		n.a.
2007	51,400	50,000		
2008	58,300	52,000		

- Use your previous answers to compute the GDP deflator in each year.
- Use GDP deflator to compute the inflation rate from 2006 to 2007, and from 2007 to 2008.

Answers to practice problem, part 2

	Nominal GDP	Real GDP	GDP deflator	Inflation rate
2006	\$46,200	\$46,200	100.0	n.a.
2007	51,400	50,000	102.8	2.8%
2008	58,300	52,000	112.1 —	9.1%

Consumer Price Index (CPI)

- A measure of the overall level of prices
- Published by the Bureau of Labor Statistics (BLS)
- Uses:
 - tracks changes in the typical household's cost of living
 - adjusts many contracts for inflation
 - allows comparisons of dollar amounts over time

How the BLS constructs the CPI

- 1. Survey consumers to determine composition of the typical consumer's "basket" of goods.
- 2. Every month, collect data on prices of all items in the basket; compute cost of basket
- 3. CPI in any month equals

 $100 imes \frac{Cost of basket in that month}{Cost of basket in base period}$

Exercise: Compute the CPI

Basket contains 20 pizzas and 10 compact discs.

prices:		
	pizza	CDs
2002	\$10	\$15
2003	\$11	\$15
2004	\$12	\$16
2005	\$13	\$15

For each year, compute

- the cost of the basket
- the CPI (use 2002 as the base year)
- the inflation rate from the preceding year

Answers:

	Cost of basket	CPI	Inflation rate
2002	\$350	100.0	n.a.
2003	370	105.7	→ 5.7%
2004	400	114.3	<mark>∕8.1%</mark>
2005	410	117.1 —	≥ 2.5%

CHAPTER 1 The Science of Macroeconomics

slide 54

The composition of the CPI's "basket"

CHAPTER 1 The Science of Macroeconomics

slide 55

Reasons why the CPI may overstate inflation

- Substitution bias: The CPI uses fixed weights, so it cannot reflect consumers' ability to substitute toward goods whose relative prices have fallen.
- Introduction of new goods: The introduction of new goods makes consumers better off and, in effect, increases the real value of the dollar. But it does not reduce the CPI, because the CPI uses fixed weights.
- Unmeasured changes in quality:

Quality improvements increase the value of the dollar, but are often not fully measured.

The size of the CPI's bias

- In 1995, a Senate-appointed panel of experts estimated that the CPI overstates inflation by about 1.1% per year.
- So the BLS made adjustments to reduce the bias.
- Now, the CPI's bias is probably under 1% per year.

CPI vs. GDP Deflator

prices of capital goods

- included in GDP deflator (if produced domestically)
- excluded from CPI

prices of imported consumer goods

- included in CPI
- excluded from GDP deflator

the basket of goods

- CPI: fixed
- GDP deflator: changes every year

Two measures of inflation in the U.S.

Categories of the population

employed

working at a paid job

unemployed

not employed but looking for a job

Iabor force

the amount of labor available for producing goods and services; all employed plus unemployed persons

not in the labor force not employed, not looking for work

Two important labor force concepts

unemployment rate

percentage of the labor force that is unemployed

Iabor force participation rate

the fraction of the adult population that "participates" in the labor force

Exercise:

Compute labor force statistics

U.S. adult population by group, June 2007

Number employed=146.1 millionNumber unemployed=6.9 millionAdult population=231.7 million

Use the above data to calculate

- the labor force
- the number of people not in the labor force
- the labor force participation rate
- the unemployment rate

Answers:

- data: *E* = 146.1, *U* = 6.9, *POP* = 231.7
- Iabor force
 L = E +U = 146.1 + 6.9 = 153.0
- not in labor force
 NILF = *POP L* = 231.7 153 = <u>78.7</u>
- unemployment rate
 U/L x 100% = (6.9/153) x 100% = <u>4.5%</u>
- Iabor force participation rate
 L/POP x 100% = (153/231.7) x 100% = <u>66.0%</u>

Chapter Summary

- Gross Domestic Product (GDP) measures both total income and total expenditure on the economy's output of goods & services.
- Nominal GDP values output at current prices; real GDP values output at constant prices. Changes in output affect both measures, but changes in prices only affect nominal GDP.
- **3.** GDP is the sum of consumption, investment, government purchases, and net exports.

CHAPTER 2 The Data of Macroeconomics

Chapter Summary

- 4. The overall level of prices can be measured by either
 - the Consumer Price Index (CPI), the price of a fixed basket of goods purchased by the typical consumer, or
 - the GDP deflator,
 the ratio of nominal to real GDP
- The unemployment rate is the fraction of the labor force that is not employed.

CHAPTER 2 The Data of Macroeconomics
