LECTURE 1

Introduction to Econometrics

Dali Laxton

February 17, 2023

<ロト < 部ト < 言ト < 言ト 1/30

WHAT IS ECONOMETRICS?

To beginning students, it may seem as if econometrics is an overly complex obstacle to an otherwise useful education. (. . .) To professionals in the field, econometrics is a fascinating set of techniques that allows the measurement and analysis of economic phenomena and the prediction of future economic trends. Studenmund (Using Econometrics: A Practical Guide)

WHAT IS ECONOMETRICS?

Econometrics is a set of statistical tools and techniques for quantitative measurement of actual economic and business phenomena

□ It attempts to

- 1 quantify economic reality
- bridge the gap between the abstract world of economic theory and the real world of human activity
- □ It has three major uses:
 - 1. describing economic reality
 - 2. testing hypotheses about economic theory
 - 3. forecasting future economic activity

▶ < Ē▶ Ē ∽Q (~ 4/30

EXAMPLE

- Consumer demand for a particular commodity can be thought of as a relationship between
 - quantity demanded (*Q*)
 - commodity's price (P)
 - price of substitute good (*P_s*)
 - disposable income (Y)
- Theoretical functional relationship:

 $Q=f(P,P_s,Y)$

• Econometrics allows us to specify:

 $Q = 31.50 - 0.73P + 0.11P_s + 0.23Y$

Lecturer: Dali Laxton Researcher at the Center for Environmental Issues UK, Prague PhD student at CERGE-EI, Prague Email: 245603@mail.muni.cz

Lectures/Seminars: Friday 14:00-17:50 @ VT203 Office hours: <u>online</u> on Tuesday 18:00-19:00 per request

INTRODUCTORY ECONOMETRICS COURSE

Course requirements:

- 2 quizzes and 2 home assignments (account for 30 points)
- Midterm exam (account for 30 points)
- Final exam/project (account for 30 points)
- Class attendance and activity (account for 10 points)
- to pass the course, student has to get at least 50 points in total

Recommended literature:

- Studenmund, A. H., Using Econometrics: A Practical Guide
- Wooldridge, J. M., Introductory Econometrics: A Modern Approach
- Adkins, L., Using gretl for Principles of Econometrics

COURSE CONTENT

• Lectures:

- Lecture 1: Introduction, repetition of statistical background, non-technical introduction to regression
- Lectures 2 4: Linear regression models
- Lectures 5 11: Violations of standard assumptions

• In-class exercises:

- Will serve to clarify and apply concepts presented on lectures
- We will use statistical software to solve the exercises

LECTURE 1.

e Introduction, repetition of statistical background

- probability theory
- statistical inference
- Readings:
 - Studenmund, A. H., Using Econometrics: A Practical Guide, Chapter 16
 - Wooldridge, J. M., Introductory Econometrics: A Modern Approach, Appendix B and C

RANDOM VARIABLES

- A random variable X is a variable whose numerical value is determined by chance. It is a quantification of the outcome of a random phenomenon.
- Discrete random variable: has a countable number of possible values

Example: the number of times that a coin will be flipped before a heads is obtained

• Continuous random variable: can take on any value in an interval

Example: time until the first goal is scored in a football match between Liverpool and Manchester United

DISCRETE RANDOM VARIABLES

- Described by listing the possible values and the associated probability that it takes on each value
- **Probability distribution** of a variable *X* that can take values *x*₁, *x*₂, *x*₃, . . . :

$$P(X = x_1) = p_1$$

 $P(X = x_2) = p_2$
 $P(X = x_3) = p_3$

:

• Cumulative distribution function (CDF):

$$F_X(x) = P(X \le x) = \sum_{i=1, x_i \le x} P(X = x_i)$$

SIX-SIDED DIE: HISTOGRAM OF DATA (1000 ROLLS)

<ロト < 部ト < 言ト < 言ト 言 の Q () 14/30

CONTINUOUS RANDOM VARIABLES

- **Probability density function** $f_X(x)$ (PDF) describes the relative likelihood for the random variable *X* to take on a particular value *x*
- Cumulative distribution function (CDF): $F_X(x) = P(X \le x) = \int_{-\infty}^{x} f_X(t) dt$
- Computationalrule:

$$P(X > x) = 1 - P(X \le x)$$

15/30

EXPECTED VALUE AND MEDIAN

• Expected value (mean):

Mean is the (long-run) average value of random variable Discrete variable Continuous variable

$$E[X] = \sum_{i=1}^{\infty} x_i P(X = x_i) \qquad E[X] = \int_{-\infty}^{+\infty} x f_X(x) dx$$

Example: calculating expected production of a wind turbine given wind speed distribution and a power curve

• Median : "the value in the middle"

EXERCISE 1

- A researcher is analyzing data on financial wealth of 100 professors at a small liberal arts college. The values of their wealth range from \$400 to \$400,000, with a mean of \$40,000, and a median of \$25,000.
- However, when entering these data into a statistical software package, the researcher mistakenly enters \$4,000,000 for the person with \$400,000 wealth.
- How much does this error affect the mean and median?

VARIANCE AND STANDARD DEVIATION

• Variance:

Measures the extent to which the values of a random variable are dispersed from the mean.

If values (outcomes) are far away from the mean, variance is high. If they are close to the mean, variance is low.

$$Var[X] = E\left[(X - E[X])^2 \right] = E[X^2] - (E[X])^2$$

- Standard deviation : $\sigma_X = \sqrt{Var[X]}$
- Note: Outliers influence on variance/sd.

DANCING STATISTICS

Watch the video "Dancing statistics: Explaining the statistical concept of variance through dance":

https://www.youtube.com/watch?v=pGfwj4GrUlA&list= PLEzw67WWDg82xKriFiOoixGpNLXK2GNs9&index=4

Use the 'dancing' terminology to answer these questions:

- 1. How do we define variance?
- 2. How can we tell if variance is large or small?
- 3. What does it mean to evaluate variance within a set?
- 4. What does it mean to evaluate variance between sets?
- 5. What is the homogeneity of variance?
- 6. What is the heterogeneity of variance?

EXERCISE 2

• Which has a higher expected value and which has a higher standard deviation:

a standard six-sided die or a four-sided die with the numbers 1 through 4 printed on the sides?

• Explain your reasoning, without doing any calculations, then verify, doing the calculations.

COVARIANCE, CORRELATION, INDEPENDENCE

e Covariance:

- How, on average, two random variables vary with one another.
- Do the two variables move in the same or opposite direction?
- Measures the amount of linear dependence between two variables.

Cov(X, Y) = E[(X - E[X])(Y - E[Y])] = E[XY] - E[X]E[Y]

e Correlation:

Similar concept to covariance, but easier to interpret. It has values between -1 and 1.

$$Corr(X, Y) = \frac{Cov(X, Y)}{\sigma_X \sigma_Y}$$

INDEPENDENCE OF VARIABLES

- **Independence** : *X* and *Y* are independent if the conditional probability distribution of *X* given the observed value of *Y* is the same as if the value of *Y* had not been observed.
- If *X* and *Y* are independent, then *Cov*(*X*, *Y*) = 0 (not the other way round in general)
- Dancing statistics: explaining the statistical concept of correlation through dance

https://www.youtube.com/watch?v=VFjaBh12C6s&index=3& list=PLEzw67WWDg82xKriFiOoixGpNLXK2GNs9

COMPUTATIONAL RULES

$$E(aX+b) = aE(X) + b$$

$$Var(aX + b) = a^2 Var(X)$$

Var(X + Y) = Var(X) + Var(Y) + 2Cov(X, Y)

Cov(aX, bY) = Cov(bY, aX) = abCov(X, Y)

Cov(X + Z, Y) = Cov(X, Y) + Cov(Z, Y)

Cov(X, X) = Var[X]

< □ > < @ > < E > < E > E のQ (~ 23/30

RANDOM VECTORS

e Sometimes, we deal with vectors of random variables

• Example:
$$\mathbf{X} = \begin{pmatrix} X_1 \\ X_2 \\ X_3 \end{pmatrix}$$

• Expected value: $E[\mathbf{X}] = \begin{pmatrix} E[X_1] \\ E[X_2] \\ E[X_3] \end{pmatrix}$

• Variance/covariancematrix:

$$Var [\mathbf{X}] = \begin{pmatrix} Var[X_1] & Cov(X_1, X_2) & Cov(X_1, X_3) \\ Cov(X_2, X_1) & Var[X_2] & Cov(X_2, X_3) \\ Cov(X_3, X_1) & Cov(X_3, X_2) & Var[X_3] \end{pmatrix}$$

STANDARDIZED RANDOM VARIABLES

- Standardization is used for better comparison of different variables
- Define *Z* to be the standardized variable of *X*:

$$Z = \frac{X - \mu_X}{\sigma_X}$$

- The standardized variable *Z* measures how many standard deviations *X* is below or above its mean
- No matter what are the expected value and variance of *X*, it always holds that

$$E[Z] = 0 \quad \text{and} \quad Var[Z] = \sigma_Z^2 = 1$$

< □ > < @ > < E > < E > E のQ (~ 25/30

NORMAL (GAUSSIAN) DISTRIBUTION

• Notation : $X \sim N(\mu, \sigma^2)$ • $E[X] = \mu$ • $Var[X] = \sigma^2$

• Dancing statistics

list=PLEzw67WWDg82xKriFiOoixGpNLXK2GNs9

<u> イロト</u> イ 団 ト イ ヨ ト イ ヨ ト ク Q (~ 26/30

EXERCISE 3

- The heights of U.S. females between age 25 and 34 are approximately normally distributed with a mean of 66 inches and a standard deviation of 2.5 inches.
- What fraction of U.S. female population in this age bracket is taller than 70 inches, the height of average adult U.S. male of this age?

EXERCISE 4

- A woman wrote to Dear Abby, saying that she had been pregnant for 310 days before giving birth.
- Completed pregnancies are normally distributed with a mean of 266 days and a standard deviation of 16 days.
- Use statistical tables to determine the probability that a completed pregnancy lasts
 -) at least 270 days
 -) at least 310 days

SUMMARY

- Today, we revised some concepts from statistics that we will use throughout our econometrics classes
- It was a very brief overview, serving only for information what students are expected to know already
- The focus was on properties of statistical distributions and on work with normal distribution tables

NEXT LECTURE

- We will go through terminology of sampling and estimation
- We will start with regression analysis and introduce the Ordinary Least Squares estimator
