# Microeconomic 

 S Dali Laxton

# The Costs of 

## Production

Chapter 13

## Brainstorming costs

## You run Ford Motor Company.

- List three different costs you have.
- List three different business decisions that are affected by your costs.

## Lecture Today

- What is a production function? What is marginal product? How are they related?
- What are the various costs? How are they related to each other and to output?
- How are costs different in the short run vs. the long run?
- What are "economies of scale"?

## Total Revenue, Total Cost, Profit

- We assume that the firm's goal is to maximize profit.

## Profit $=$ Total revenue - Total cost

the amount a
firm receives
from the sale
of its output
the market value of the inputs a firm uses in production

Costs: Explicit vs. Implicit
" Explicit costs require an outlay of money, e.g., paying wages to workers.

- Implicit costs do not require a cash outlay, e.g., the opportunity cost of the owner's time.
- Remember one of the Ten Principles:

## The cost of something is what you give up to get it.

- This is true whether the costs are implicit or explicit. Both matter for firms' decisions.

## Explicit vs. Implicit Costs: An Example

You need $\$ 100,000$ to start your business. The interest rate is $5 \%$.
" Case 1: borrow \$100,000
" explicit cost = $\$ 5000$ interest on loan
" Case 2: use \$40,000 of your savings, borrow the other $\$ 60,000$
" explicit cost = \$3000 (5\%) interest on the loan
" implicit cost = \$2000 (5\%) foregone interest you could have earned on your $\$ 40,000$.

In both cases, total ( $\exp +\mathbf{i m p}$ ) costs are $\$ 5000$.

## Economic Profit vs. Accounting Profit

- Accounting profit
= total revenue minus total explicit costs
- Economic profit
= total revenue minus total costs (including explicit and implicit costs)
- Accounting profit ignores implicit costs, so it's higher than economic profit.

## active learning 2 <br> Economic profit vs. accounting profit

The equilibrium rent on office space has just increased by $\$ 500 / m o n t h$.

Determine the effects on accounting profit and economic profit if:
a. you rent your office space
b. you own your office space

## Answers

The rent on office space increases \$500/month.
a. You rent your office space.

Explicit costs increase \$500/month.
Accounting profit \& economic profit each fall \$500/month.
b. You own your office space.

Explicit costs do not change, so accounting profit does not change. Implicit costs increase \$500/month (opp. cost of using your space instead of renting it) so economic profit falls by $\$ 500 /$ month.

## The Production Function

- A production function shows the relationship between the quantity of inputs used to produce a good and the quantity of output of that good.
- It can be represented by a table, equation, or graph.
" Example 1:
" Farmer Slavko grows wheat.
- He has 5 acres of land.
- He can hire as many workers as he wants.

## eXAMPLE 1: Farmer Slavko's Production Function

| $\boldsymbol{L}$ <br> (no. of <br> workers) | $\boldsymbol{Q}$ <br> (bushels <br> of wheat) |
| :---: | :---: |
| 0 | 0 |
| 1 | 1000 |
| 2 | 1800 |
| 3 | 2400 |
| 4 | 2800 |
| 5 | 3000 |

## Marginal Product

" If Slavko hires one more worker, his output rises by the marginal product of labor.
" The marginal product of any input is the increase in output arising from an additional unit of that input, holding all other inputs constant.

- Notation:
$\Delta$ (delta) = "change in..."
Examples:
$\Delta Q=$ change in output, $\Delta L=$ change in labor
- Marginal product of labor $(M P L)=\frac{\Delta Q}{\Delta L}$

## EXAMPLE 1: Total \& Marginal Product

MPL

0
1000
1800
2400
2800
3000 $\begin{cases}\Delta Q=1000 & 1000 \\ \Delta Q=800 & 800 \\ \Delta Q=600 & 600 \\ \Delta Q=400 & 400 \\ \Delta Q=200 & 200\end{cases}$

## EXAMPLE 1: MPL = Slope of Prod Function

## Why MPL Is Important

" Recall one of the Ten Principles: Rational people think at the margin.
" When Farmer Slavko hires an extra worker,
" his costs rise by the wage he pays the worker
" his output rises by MPL
" Comparing them helps Slavko decide whether he should hire the worker.

## Why MPL Diminishes

- Farmer Slavko's output rises by a smaller and smaller amount for each additional worker. Why?
* As he adds workers, the average worker has less land to work with and will be less productive.
" In general, MPL diminishes as $L$ rises whether the fixed input is land or capital (equipment, machines, etc.).
" Diminishing marginal product: The marginal product of an input declines as the quantity of the input increases (other things equal).

## eXAMPLE 1: Farmer Slavko's Costs

" Farmer must pay \$1000 per month for the land, regardless of how much wheat he grows.
" The market wage for a farm worker is $\$ 2000$ per month.

- So Slavko's costs are related to how much wheat he produces....

## EXAMPLE 1: Farmer Slavko's Costs

$\begin{array}{ccccc}\boldsymbol{L} & \mathbf{Q} & \begin{array}{c}\text { Cost of }\end{array} & \begin{array}{c}\text { Cost of }\end{array} & \begin{array}{c}\text { Total } \\ \text { (no. of } \\ \text { workers) }\end{array} \\ \text { (bushels wheat) }\end{array} \quad \begin{gathered}\text { land } \\ \text { labor }\end{gathered} \quad \begin{gathered}\text { cost }\end{gathered}$

| 0 | 0 | $\$ 1,000$ | $\$ 0$ | $\$ 1,000$ |
| ---: | ---: | ---: | ---: | ---: |
| 1 | 1000 | $\$ 1,000$ | $\$ 2,000$ | $\$ 3,000$ |
| 2 | 1800 | $\$ 1,000$ | $\$ 4,000$ | $\$ 5,000$ |
| 3 | 2400 | $\$ 1,000$ | $\$ 6,000$ | $\$ 7,000$ |
| 4 | 2800 | $\$ 1,000$ | $\$ 8,000$ | $\$ 9,000$ |
| 5 | 3000 | $\$ 1,000$ | $\$ 10,000$ | $\$ 11,000$ |

## EXAMPLE 1: Slavko's Total Cost Curve

## Marginal Cost

" Marginal Cost (MC) is the increase in Total Cost from producing one more unit:

$$
M C=\frac{\Delta T C}{\Delta Q}
$$

## EXAMPLE 1: Total and Marginal Cost

| $\boldsymbol{Q}$ | (bushels |
| :---: | :---: |
| of wheat) | Total |
| Cost |  |,$~$

Marginal
Cost (MC)

## EXAMPLE 1: The Marginal Cost Curve

| (bushels of wheat) | TC | MC |  | \$12 $\$ 10$ |  |  | * |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | \$1,000 |  | 碞 | \$8 |  |  |  |
| 1000 | \$3,000 | \$2.00 | - | \$6 |  |  |  |
| 1800 | \$5,000 | \$2.50 | $\begin{aligned} & \text { Cㅡㅡㅇ } \\ & \text { 읃 } \end{aligned}$ | \$4 |  |  |  |
|  |  | \$3.33 |  |  |  | - |  |
| 2400 | \$7,000 |  |  | \$2 |  |  |  |
|  |  | \$5.00 |  |  |  |  |  |
| 2800 | \$9,000 |  |  | \$0 |  |  |  |
| 3000 | \$11,000 | \$10.00 |  | 0 | 1,000 | 2,000 | 3,000 |
| 3000 | \$11,000 |  |  |  |  |  |  |

## Why MC Is Important

- Farmer Slavko is rational and wants to maximize his profit. To increase profit, should he produce more or less wheat?
" To find the answer, he needs to "think at the margin."
- If the cost of an additional wheat ( $M C$ ) is less than the revenue he would get from selling it, then Alejandro's profits rise if he produces more.

## Fixed and Variable Costs

- Fixed costs (FC) do not vary with the quantity of output produced.
- For Farmer Slavko, FC = \$1000 for his land
- Other examples: cost of equipment, loan payments, rent
" Variable costs (VC) vary with the quantity produced.
" For Farmer Slavko, VC = wages he pays workers
- Other example: cost of materials
- Total cost (TC) = FC + VC

## EXAMPLE 2

" Our second example is more general, applies to any type of firm producing any good with any types of inputs.

## EXAMPLE 2: Costs

| $\boldsymbol{Q}$ | $F C$ | $V C$ | $T C$ |
| ---: | ---: | ---: | :---: |
| 0 | $\$ 100$ | $\$ 0$ | $\$ 100$ |
| 1 | 100 | 70 | 170 |
| 2 | 100 | 120 | 220 |
| 3 | 100 | 160 | 260 |
| 4 | 100 | 210 | 310 |
| 5 | 100 | 280 | 380 |
| 6 | 100 | 380 | 480 |
| 7 | 100 | 520 | 620 |

## EXAMPLE 2: Marginal Cost

| $\boldsymbol{Q}$ | TC | $M C$ |
| ---: | ---: | ---: |
| 0 | $\$ 100$ | $\$ 70$ |
| 1 | 170 | 50 |
| 2 | 220 | 40 |
| 3 | 260 | 40 |
| 4 | 310 | 50 |
| 5 | 380 | 70 |
| 6 | 480 | 100 |
| 7 | 620 | 140 |

## EXAMPLE 2: Average Fixed Cost

| $\boldsymbol{Q}$ | $F C$ | $A F C$ |
| ---: | ---: | ---: |
| 0 | $\$ 100$ | $\mathrm{n} / \mathrm{a}$ |
| 1 | 100 | $\$ 100$ |
| 2 | 100 | 50 |
| 3 | 100 | 33.33 |
| 4 | 100 | 25 |
| 5 | 100 | 20 |
| 6 | 100 | 16.67 |
| 7 | 100 | 14.29 |

## EXAMPLE 2: Average Variable Cost

| $\boldsymbol{Q}$ | $V C$ | $A V C$ |
| ---: | ---: | ---: |
| 0 | $\$ 0$ | $\mathrm{n} / \mathrm{a}$ |
| 1 | 70 | $\$ 70$ |
| 2 | 120 | 60 |
| 3 | 160 | 53.33 |
| 4 | 210 | 52.50 |
| 5 | 280 | 56.00 |
| 6 | 380 | 63.33 |
| 7 | 520 | 74.29 |

## EXAMPLE 2: Average Total Cost

| $\boldsymbol{Q}$ | TC | ATC | AFC | AVC |
| ---: | :---: | ---: | ---: | ---: |
| 0 | $\$ 100$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ |
| 1 | 170 | $\$ 170$ | $\$ 100$ | $\$ 70$ |
| 2 | 220 | 110 | 50 | 60 |
| 3 | 260 | 86.67 | 33.33 | 53.33 |
| 4 | 310 | 77.50 | 25 | 52.50 |
| 5 | 380 | 76 | 20 | 56.00 |
| 6 | 480 | 80 | 16.67 | 63.33 |
| 7 | 620 | 88.57 | 14.29 | 74.29 |

Average total cost (ATC)/cost per unit/unit cost equals total cost divided by the quantity of output:

$$
\begin{aligned}
& \quad A T C=T C / Q \\
& \text { Also, }
\end{aligned}
$$

$$
A T C=A F C+A V C
$$

## EXAMPLE 2: Average Total Cost

| $\boldsymbol{Q}$ | $T C$ | $A T C$ |
| ---: | ---: | ---: |
| 0 | $\$ 100$ | n $/ \mathrm{a}$ |
| 1 | 170 | $\$ 170$ |
| 2 | 220 | 110 |
| 3 | 260 | 86.67 |
| 4 | 310 | 77.50 |
| 5 | 380 | 76 |
| 6 | 480 | 80 |
| 7 | 620 | 88.57 |

## EXAMPLE 2: The Various Cost Curves Together

$$
\begin{aligned}
& \rightarrow A T C \\
& \rightarrow A V C \\
& \rightarrow A F C \\
& \rightarrow M C
\end{aligned}
$$

## Calculating costs

Fill in the blank spaces of this table.

| $\boldsymbol{Q}$ | VC | TC | AFC | AVC | ATC | MC |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 |  | $\$ 50$ | $n / a$ | $n / a$ | $n / a$ | $\$ 10$ |
| 1 | 10 |  |  | $\$ 10$ | $\$ 60.00$ |  |
| 2 | 30 | 80 |  |  |  | 30 |
| 3 |  |  | 16.67 | 20 | 36.67 |  |
| 4 | 100 | 150 | 12.50 |  | 37.50 |  |
| 5 | 150 |  |  | 30 |  | 60 |
| 6 | 210 | 260 | 8.33 | 35 | 43.33 |  |

## Answers

First, deduce $F C=\$ 50$ and use $F C+V C=T C$.

| $\boldsymbol{Q}$ | VC | TC | AFC | AVC | ATC | MC |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | $\$ 0$ | $\$ 50$ | $n / a$ | $n / a$ | $n / a$ |  |
|  | $\$ 10$ |  |  |  |  |  |
| 1 | 10 | 60 | $\$ 50.00$ | $\$ 10$ | $\$ 60.00$ | $\$ 0$ |
| 2 | 30 | 80 | 25.00 | 15 | 40.00 | 20 |
| 3 | 60 | 110 | 16.67 | 20 | 36.67 | 30 |
| 4 | 100 | 150 | 12.50 | 25 | 37.50 | 40 |
| 5 | 150 | 200 | 10.00 | 30 | 40.00 | 50 |
| 6 | 210 | 260 | 8.33 | 35 | 43.33 | 60 |

## EXAMPLE 2: Why ATC Is Usually U-Shaped

As $\boldsymbol{Q}$ rises:
Initially,
falling AFC pulls ATC down.

Eventually, rising AVC pulls ATC up.

Efficient scale:
The quantity that minimizes ATC.

## EXAMPLE 2: ATC and MC

When MC < ATC, ATC is falling.

When MC > ATC, $A T C$ is rising.

The MC curve crosses the ATC curve at the ATC curve's minimum.

## Costs in the Short Run \& Long Run

- Short run:

Some inputs are fixed (e.g., factories, land). The costs of these inputs are FC.

- Long run:

All inputs are variable
(e.g., firms can build more factories or sell existing ones).

- In the long run, $A T C$ at any $\mathbf{Q}$ is cost per unit using the most efficient mix of inputs for that $\boldsymbol{Q}$ (e.g., the factory size with the lowest ATC).

## EXAMPLE 3: LRATC with 3 factory sizes

Firm can choose from three factory Avg sizes: S, M, L.

Each size has its own SRATC curve.

The firm can change to a different factory size in the long
 run, but not in the short run.

## EXAMPLE 3: LRATC with 3 factory sizes

To produce less than $\boldsymbol{Q}_{\boldsymbol{A}}$, firm will Avg than $\boldsymbol{Q}_{\mathrm{B}}$, firm will choose size $\mathbf{L}$ in the long run.

## A Typical LRATC Curve

In the real world, factories come in many sizes, each with its own SRATC curve.

So a typical LRATC curve looks like this:

## How ATC Changes as the Scale of Production Changes

Economies of scale: ATC falls as $\boldsymbol{Q}$ increases.

Constant returns to scale: ATC stays the same as $\boldsymbol{Q}$ increases.

Diseconomies of scale: ATC rises
 as $\mathbf{Q}$ increases.

> How ATC Changes as the Scale of Production Changes

- Economies of scale occur when increasing production allows greater specialization: workers are more efficient when focusing on a narrow task.
- More common when $\boldsymbol{Q}$ is low.
- Diseconomies of scale are due to coordination problems in large organizations.
E.g., management becomes stretched, can't control costs.
- More common when $\mathbf{Q}$ is high.

## CONCLUSION

- Costs are critically important to many business decisions including production, pricing, and hiring.
- This chapter has introduced the various cost concepts.
- The following chapters will show how firms use these concepts to maximize profits in various market structures.

## Summary

- Implicit costs do not involve a cash outlay, yet are just as important as explicit costs to firms' decisions.
- Accounting profit is revenue minus explicit costs. Economic profit is revenue minus total (explicit + implicit) costs.
- The production function shows the relationship between output and inputs.

## Summary

- The marginal product of labor is the increase in output from a one-unit increase in labor, holding other inputs constant. The marginal products of other inputs are defined similarly.
- Marginal product usually diminishes as the input increases. Thus, as output rises, the production function becomes flatter and the total cost curve becomes steeper.
- Variable costs vary with output; fixed costs do not.

## Summary

- Marginal cost is the increase in total cost from an extra unit of production. The MC curve is usually upward-sloping.
- Average variable cost is variable cost divided by output.
- Average fixed cost is fixed cost divided by output. AFC always falls as output increases.
- Average total cost (sometimes called "cost per unit") is total cost divided by the quantity of output. The ATC curve is usually U-shaped.

## Summary

- The MC curve intersects the ATC curve at minimum average total cost. When MC < ATC, ATC falls as $Q$ rises. When MC > ATC, ATC rises as $Q$ rises.
- In the long run, all costs are variable.
- Economies of scale: ATC falls as $Q$ rises. Diseconomies of scale: ATC rises as $Q$ rises. Constant returns to scale: ATC remains constant as $Q$ rises.
