15. hodnota koeficientu v tomto p

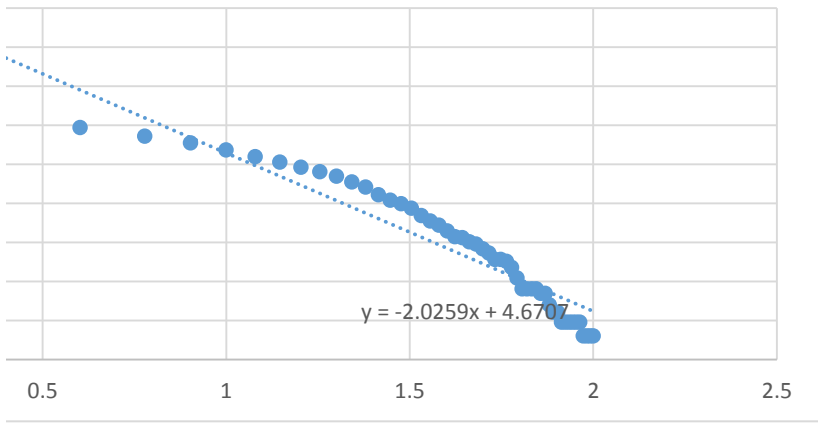

Log-log distribuce stupně

uce stupně v pomocných souřadnicích, přímk
regrese

plementární kumulativní distribuce stupně v
omocných souřadnicích, přímk regrese

zlu - graf 1

stupně v síti - buňky F2 a G2

lila jsem 50, proto stupně 1 až 100 rozdělit na skupinky po dvou, uložit vyšší hodnotu hodnoty kumulativních četností, ať dostaneme reálné četnosti v dané kategorii stupně x kategorie (sloupec H), osa y četnosti (sloupec J), logaritmické souřadnice obou os vzhledem k přímce, teď ale musíme transformovat osy

sa x

logaritmické souřadnice na osách, osa x sloupec L, osa y sloupce K

koeficient před x je naše hledané gamma - power-law koeficient

pro síťové struktury máme mezi 2 až 3, toto se k tomu blíží a mohlo být způsobeno spoustou faktorů

pro kumulativní četnosti, tedy počet uzlů, které mají stupeň větší nebo rovno než daná hodnota/kategorie, vzhledem k kumulativním četnostem

m. Distribuce v pomocných (log) souřadnicích, proložení přímkou regrese

výsledek odpovídá 2.03, což už je v našem chtěném rozpětí power-law koeficientu

ie
