#### ■ HMM(the general case):

- five-tuple  $(S, S_0, Y, P_S, P_Y)$ , where:

- $S = \{s_1, s_2, \dots, s_T\}$  is the set of states,  $S_0$  is the initial state,
- $Y = \{y_1, y_2, \dots, y_T\}$  is the output alphabet,
- $P_S(s_j | s_i)$  is the set of prob. distributions of transitions,
- $P_Y(y_k | s_i, s_j)$  is the set of output (emission) probability distributions.

#### ■ Given an HMM & an output sequence $Y = \{y_1, y_2, \dots, y_k\}$ :

- (Task 1) compute the probability of  $Y$ ;
- (Task 2) compute the most likely sequence of states which has generated  $Y$
- (Task 3) Estimating the parameters (transition/output distributions)

HMM Parameter Estimation: the Baum-Welch algorithm2/14

## A variant of Expectation–Maximization

- Idea(~EM, for another variant see LM smoothing (lect. 3)):
  - Start with (possibly random) estimates of  $P_S$  and  $P_Y$ .
  - Compute (fractional) "counts" of state transitions/emissions taken, from  $P_S$  and  $P_Y$ , given data  $Y$
  - Adjust the estimates of  $P_S$  and  $P_Y$  from these "counts" (using MLE, i.e. relative frequency as the estimate).
- Remarks:
  - many more parameters than the simple four-way smoothing
  - no proofs here; see Jelinek Chapter 9

## Setting

- HMM (without  $P_S, P_Y$ )  $(S, S_0, Y)$ , and data  $T = \{y_i \in Y\}_{i=1\dots|T|}$ 
  - will use  $T \sim |T|$
- HMM structure is given:  $(S, S_0)$
- $P_S$ : Typically, one wants to allow "fully connected" graph
  - (i.e. no transitions forbidden ~ no transitions set to hard 0)
  - why? → we better leave it on the learning phase, based on the data!
  - sometimes possible to remove some transitions ahead of time
- $P_Y$  : should be restricted (if not, we will not get anywhere!)
  - restricted ~ hard 0 probabilities of  $p(y|s, s')$
  - "Dictionary": states ↔ words, "m:n" mapping on  $S \times Y$  (in general)

HMM Parameter Estimation: the Baum-Welch algorithm4/14

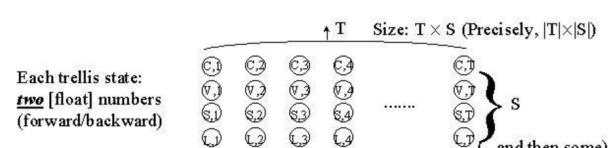

## Initialization

- For computing the initial expected "counts"
- Important part
  - EM guaranteed to find a *local* maximum only (albeit a good one in most cases)
- $P_Y$  initialization more important
  - fortunately, often easy to determine
    - together with dictionary ↔ vocabulary mapping, get counts, then MLE
- $P_S$  initialization less important
  - e.g. uniform distribution for each  $p(.|s)$

## Data structures

#### ■ Will need storage for:

- The predetermined structure of the HMM (unless fully connected → need not to keep it!)
- The parameters to be estimated ( $P_S, P_Y$ )
- The expected counts (same size as  $(P_S, P_Y)$ )
- The training data  $T = \{y_i \in Y\}_{i=1\dots T}$
- The trellis (if f.c.):

HMM Parameter Estimation: the Baum-Welch algorithm6/14

## The Algorithm Part I

- 1 Initialize  $P_S, P_Y$
- 2 Compute "forward" probabilities:
  - ▶ follow the procedure for trellis (summing), compute  $\alpha(s, i)$  everywhere
  - ▶ use the current values of  $P_S, P_Y(p(s'|s), p(y|s, s'))$  :
 
$$\alpha(s', i) = \sum_{s \rightarrow s'} \alpha(s, i-1) \times p(s'|s) \times p(y_i|s, s')$$
  - ▶ NB: do not throw away the previous stage!
- 3 Compute "backward" probabilities
  - ▶ start at all nodes of the last stage, proceed backwards,  $\beta(s, i)$
  - ▶ i.e., probability of the "tail" of data from stage  $i$  to the end of data
 
$$\beta(s', i) = \sum_{s' \leftarrow s} \beta(s, i+1) \times p(s|s') \times p(y_{i+1}|s', s)$$
  - ▶ also, keep the  $\beta(s, i)$  at all trellis states

PA154 Jazykové modelování (6.1)

HMM Parameter Estimation: the Baum-Welch algorithm 7/14

## Baum-Welch: Tips & Tricks

- Normalization badly needed
  - ▶ long training data → extremely small probabilities
- Normalize  $\alpha, \beta$  using the same norm.factor:
 
$$N(i) = \sum_{s \in S} \alpha(s, i)$$
 as follows:
  - ▶ compute  $\alpha(s, i)$  as usual (Step 2 of the algorithm), computing the sum  $N(i)$  at the given stage  $i$  as you go.
  - ▶ at the end of each stage, recompute all *alphas*(for each state  $s$ ):
 
$$\alpha^*(s, i) = \alpha(s, i)/N(i)$$
  - ▶ use the same  $N(i)$  for  $\beta$ s at the end of each backward (Step 3) stage:
 
$$\beta^*(s, i) = \beta(s, i)/N(i)$$

PA154 Jazykové modelování (6.1)

HMM Parameter Estimation: the Baum-Welch algorithm 9/14

## Example: Initialization

- Output probabilities:
  - ▶  $p_{init}(w|c) = c(c, w)/c(c)$ ; where  $c(S, the) = c(L, the) = c(the)/2$  (other than that, everything is deterministic)
- Transition probabilities:
  - ▶  $p_{init}(c'|c) = 1/4$ (uniform)
- Don't forget:
  - ▶ about the space needed
  - ▶ initialize  $\alpha(X, 0) = 1$  ( $X$ : the never-occurring front buffer st.)
  - ▶ initialize  $\beta(s, T) = 1$  for all  $s$  (except for  $s = X$ )

PA154 Jazykové modelování (6.1)

HMM Parameter Estimation: the Baum-Welch algorithm 11/14

## The Algorithm Part II

### 1 Collect counts:

- ▶ for each output/transition pair compute

$$c(y, s, s') = \sum_{i=0, k-1, y=y_{i+1}} \alpha(s, i) p(s'|s) p(y_{i+1}|s, s') \beta(s', i+1)$$

one pass through data,  
only stop at (output)  $y$

prefix prob.      this transition prob  
× output prob

$$c(s, s') = \sum_{y \in Y} c(y, s, s') \quad (\text{assuming all observed } y_i \text{ in } Y)$$

$$c(s) = \sum_{s' \in S} c(s, s')$$

$$2 \text{ Reestimate: } p'(s'|s) = c(s, s')/c(s) \quad p'(y|s, s') = c(y, s, s')/c(s, s')$$

3 Repeat 2-5 until desired convergence limit is reached

PA154 Jazykové modelování (6.1)

HMM Parameter Estimation: the Baum-Welch algorithm 8/14

## Example

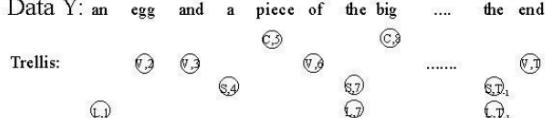

### ■ Task: pronunciation of "the"

### ■ Solution: build HMM, fully connected, 4 states:

- ▶ S - short article, L - long article, C,V - word starting w/consonant, vowel
- ▶ thus, only "the" is ambiguous (a, an, the - not members of C,V)

■ Output form states only ( $p(w|s, s') = p(w|s')$ )

- Data Y: an egg and a piece of the big .... the end

PA154 Jazykové modelování (6.1)

HMM Parameter Estimation: the Baum-Welch algorithm 10/14

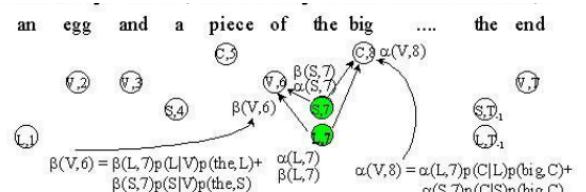

## Fill in alpha, beta

### ■ Left to right, alpha:

$$\alpha(s', i) = \sum_{s \rightarrow s'} \alpha(s, i-1) \times p(s'|s) \times p(w_i|s'), \text{ where } s' \text{ is the output from states}$$

### ■ Remember normalization ( $N(i)$ ).

■ Similarly, beta (on the way back from the end).

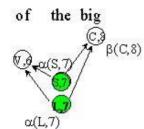

PA154 Jazykové modelování (6.1)

HMM Parameter Estimation: the Baum-Welch algorithm 12/14

## Counts & Reestimation

- One pass through data
- At each position  $i$ , go through all pairs  $(s_i, s_{i+1})$
- Increment appropriate counters by frac. counts (Step 4):
  - ▶  $\text{inc}(y_{i+1}, s_i, s_{i+1}) = a(s_i, i)p(s_{i+1}|s_i)p(y_{i+1}|s_{i+1})b(s_{i+1}, i+1)$
  - ▶  $c(y, s_i, s_{i+1}) += \text{inc}$  (for  $y$  at pos  $i+1$ )
  - ▶  $c(s_i, s_{i+1}) += \text{inc}$  (always)
  - ▶  $c(s_i) += \text{inc}$  (always)
    - $\text{inc}(\text{big}, L, C) = \alpha(L, 7)p(C|L)p(\text{big}, C)\beta(V, 8)$
    - $\text{inc}(\text{big}, S, C) = \alpha(S, 7)p(C|S)p(\text{big}, C)\beta(V, 8)$
- Reestimate  $p(s'|s), p(y|s)$ 
  - ▶ and hope for increase in  $p(C|S)$  and  $p(V|L) \dots !!$

## HMM: Final Remarks

- Parameter "tying"
  - ▶ keep certain parameters same ( $\sim$  just one "counter" for all of them)
  - ▶ any combination in principle possible
  - ▶ ex.: smoothing (just one set of lambdas)
- Real Numbers Output
  - ▶  $Y$  of infinite size ( $R, R^n$ )
    - ▶ parametric (typically: few) distribution needed (e.g., "Gaussian")
- "Empty" transitions: do not generate output
  - ▶  $\sim$  vertical areas in trellis; do not use in "counting"
