Linguistic Objects in this Course

■ Trees (with strings at the nodes)

- Syntax, semantics
- ► Algorithms: Generation, parsing, inside-outside, build semantics

■ Sequences (of strings)

- ▶ n-grams, tag sequences
- morpheme sequences, phoneme sequences
- ► Algorithms: Finite-state, best-paths, forward-backward

"Atoms" (unanalyzed strings)

- ► Words, morphemes
- ► Represent by contexts other words they occur with
- ► Algorithms: **Grouping similar words**, splitting words into senses

A Concordance for "party" - from www.webcorp.org.uk

A Concordance for "party" - from www.webcorp.org.uk

- thing. She was talking at a party thrown at Daphne's restaurant in
- have turned it into the hot dinner-party topic. The comedy is the
- selection for the World Cup **party**, which will be announced on May 1
- in the 1983 general election for a party which, when it could not bear to
- to attack the Scottish National Party, who look set to seize Perth and
- that had been passed to a second **party** who made a financial decision
- the by-pass there will be a street **party**. "Then,"he says, "we are going
- number-crunchers within the Labour party, there now seems little doubt
- political tradition and the same **party**. They are both relatively Anglophilic
- he told Tony Blair's modernised party they must not retreat into "warm
- "Oh no, I'm just here for the party," they said. "I think it's terrible
- A future obliges each **party** to the contract to fulfil it by
- be signed by or on behalf of each **party** to the contract."Mr David N

- that had been passed to a second party who made a financial decision
- A future obliges each party to the contract to fulfil it by
- be signed by or on behalf of each party to the contract." Mr David N

John threw a "rain forest" party last December. His living room was full of plants and his box was playing Brazilian music . . .

- Replace word w with sense s
 - 1 Splits w into senses: distinguishes this token of w from tokens with sense t
 - f Z Groups f w with other words: groups this token of f w with tokens of f x that also have sense f s

- number-crunchers within the Labour party, there now seems little doubt
- political tradition and the same party. They are both relatively Anglophilic
- he told Tony Blair's modernised party they must not retreat into "warm
- thing. She was talking at a party thrown at Daphne's restaurant in

- Semantics / Text understanding
 - ► Axioms about TRANSFER apply to (some tokens of) throw
 - ► Axioms about BUILDING apply to (some tokens of) bank
- Machine translation
- Info retrieval / Question answering / Text categ.
 - Query or pattern might not match document exactly
- Backoff for just about anything
 - ▶ what word comes next? (speech recognition, language ID,...)
 - trigrams are sparse but tri-meanings might not be
 - ▶ bilexical PCFGs:
 - ▶ p(S[devour] → NP[lion] VP[devour] | S[devour])
 - ▶ approximate by $p(S[EAT] \rightarrow NP[lion] VP[EAT] \mid S[EAT])$
- Speaker's real intention is senses; words are a noisy channel

Cues to Word Sense

- Adjacent words (or their senses)
- Grammatically related words (subject, object, ...)
- Other nearby words
- Topic of document
- Sense of other tokens of the word in the same document

Word Classes by Tagging

- Every tag is a kind of class
- Tagger assigns a class to each word token

Word Classes by Tagging

- Every tag is a kind of class
- Tagger assigns a class to each word token
 - ► Simultaneously groups and splits words
 - ▶ "party" gets split into N and V senses
 - "bash" gets split into N and V senses
 - ► {party/N, bash/N} vs. {party/V, bash/V}
 - What good are these groupings?

Learning Word Classes

- Every tag is a kind of class
- Tagger assigns a class to each word token
 - ► {party/N, bash/N} vs. {party/V, bash/V}
 - ▶ What good are these groupings?
 - Good for predicting next word or its class!
- Role of forward-backward algorithm?
 - It adjusts classes etc. in order to predict sequence of words better (with lower perplexity)

Words and Vectors

- Represent each word **type** w (party) by a point in k-dimensional space
 - ► e.g., **k** is size of vocabulary
 - ▶ the 17th coordinate of **w** represents **strength** of **w**'s association with vocabulary word 17

Count

1	
0	
7	too high
1	
0	too low
	0 0 3 1 0 7

From corpus: Jim Jeffords **abandoned** the Republican **party**. There were lots of **abbot**s and nuns dancing at that **party**. The **party above** the art gallery was, **above** all, a laboratory for synthesizing **zygote**s and beer.

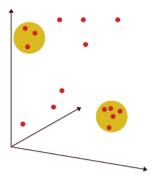

- Represent each word **type** w (party) by a point in k-dimensional space
 - ► e.g., **k** is size of vocabulary
 - ▶ the 17th coordinate of w represents strength of w's association with vocabulary word 17.
- How might you measure this?
 - how often words appear next to each other
 - ▶ how often words appear near each other
 - ▶ how often words are syntactically linked
 - ▶ should correct for commonness of word (e.g., "above")

- Represent each word type w (party) by a point in k-dimensional space
 - ► e.g., **k** is size of vocabulary
 - ▶ the 17th coordinate of **w** represents **strength** of w's association with vocabulary word 17.
- Plot all word types in k-dimensional space
- Look for **clusters** of close-together types

Learning Classes by Clustering

- Plot all word types in k-dimensional space
- Look for **clusters** of close-together types

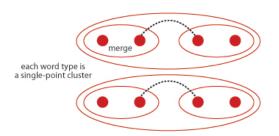

Plot in **k** dimensions (k=3)

Bottom-Up Clustering

- Start with one cluster per point
- Repeatedly merge 2 closest clusters
 - ▶ **Single-link**: $dist(A,B) = min \ dist(a,b) \ for \ a \in A, b \in B$
 - ▶ Complete-link: $dist(A,B) = max \ dist(a,b)$ for $a \in A, b \in B$

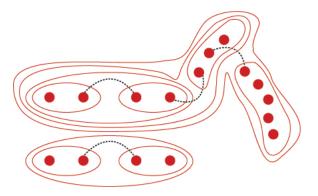

Single-Link

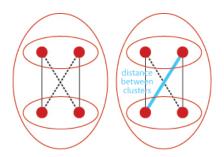

- Again, merge closest pair of clusters:
 - ▶ Single-link: clusters are close if any of their points are $dist(A,B) = min \ dist(a,b) \ for \ a \in A, b \in B$

Single-Link

■ Fast, but tend to get long, stringy, meandering clusters

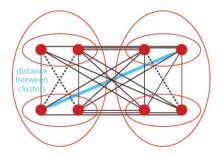

Complete-Link

- Again, merge closest pair of clusters:
 - ▶ Complete-link: clusters are close only if all of their points are $dist(A,B) = max \ dist(a,b)$ for $a \in A, b \in B$

Complete-Link

■ Slow to find closest pair – need quadratically many distances

Summary

- Start with one cluster per point
- Repeatedly merge 2 closest clusters
 - ▶ **Single-link**: $dist(A,B) = min \ dist(a,b) \ for \ a \in A, b \in B$
 - ▶ **Complete-link**: $dist(A,B) = max \ dist(a,b) \ for \ a \in A, b \in B$
 - ▶ too slow to update cluster distances after each merge; but alternatives!
 - ▶ Average-link: $dist(A,B) = mean \ dist(a,b) \ for \ a \in A, b \in B$
 - ► **Centroid-link**: dist(A,B) = dist(mean(A),mean(B))
- Stop when clusters are "big enough"
 - e.g., provide adequate support for backoff (on a development corpus)
- Some flexibility in defining dist(a,b)
 - ▶ Might not be Euclidean distance; e.g., use vector angle

EM Clustering (for k clusters)

- EM algorithm
 - ▶ Viterbi version called "k-means clustering"
 - ► Full EM version called "Gaussian mixtures"
- Expectation step: Use current parameters (and observations) to reconstruct hidden structure
- Maximization step: Use that hidden structure (and observations) to reestimate parameters
- Parameters: k points representing cluster centers
- **Hidden structure**: for each data point (word type), which center generated it?
