Process modeling II

PV207 – Business Process Management Spring 2022

Jiří Kolář, Lubomír Dočkal, Lubomír Hruban

• Why process modeling?

- Why process modeling?
- BPMN L1, L2, L3

- Why process modeling?
- BPMN L1, L2, L3
- Quality aspects of process model

- Why process modeling?
- BPMN L1, L2, L3
- Quality aspects of process model
- Process interactions
 - Private process
 - Abstract process (Black box/Collapsed Pool)
 - Collaboration (Global) process

- Pool and Lane
- Task (User, Service, Abstract/None)
- Subprocess (Collapsed, Expanded)
- Start Event (None, Message, Timer)
- End Event (None, Message, Terminate) •

- Gateway (Parallel, Exclusive)
- Sequence Flow
- Message Flow
- Data Object (Data store, Message)
- Text Annotation
- Link Event Pair

Lecture overview

- Information sources
- From L1 to L2
- L2: timing precision

- BPMN 2.0 Level 2:
 - \circ Subprocess
 - Activity call
 - Events
 - Messages
 - Signals
 - Errors
 - Escalations
 - Gateways
 - BPMN 2.0 summary

Information sources

- BOOK: BPMN method and style / Bruce Silver
 - ISBN:9780982368107, Library FI, Amazon 33\$
- BPMN 2.0 poster
 - <u>http://www.bpmb.de/images/BPMN2_0_Poster_EN.pdf</u>
- Signavio modeler academic licence
 - http://academic.signavio.com/p/login
- BPMN official OMG website
 - <u>http://www.bpmn.org</u>

BPMN 2.0: from L1 to L2

• Level 1

- Flowcharting
- Business experts <=> analysts/developers
- The goal is to express simple activity sequences
- Minimum of nesting and interprocess interactions
- Simple events only
- Level 2
 - Analytical BPMN model
 - Process analysts <=> Process developers
 - Precise activity execution timing
 - Subprocess nesting and interprocess interactions
 - Events and signals, exception handling

Level 2: timing precision

- Each activity has exact start and completion
- Service task
 - Starts immediately when reached
 - Being performed immediately and completed
- User task
 - Starts immediately when reached
 - Being performed once user open it in a "worklist" = task "claim"

Activity states

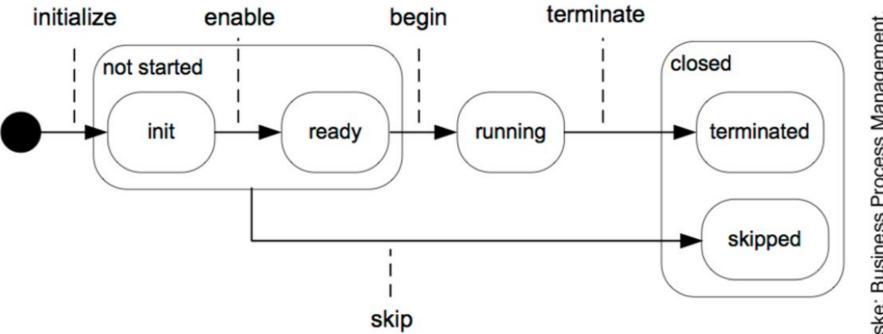

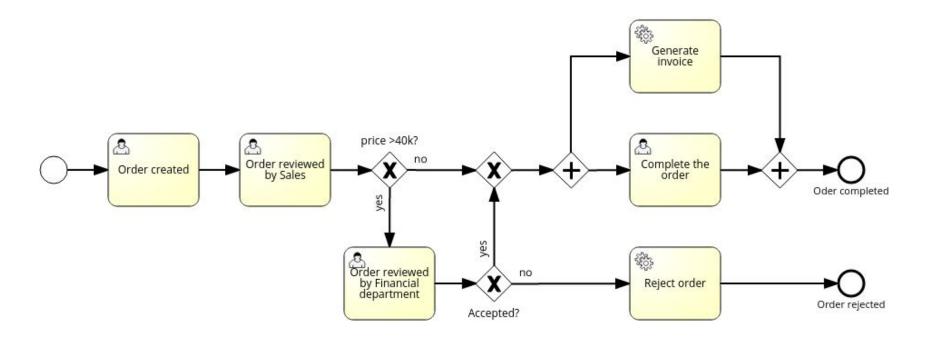

Fig. 3.9. State transition diagram for activity instances

Springer-Verlag Berlin Heidelberg 2012, 2007 M. Weske: Business Process Management, 0

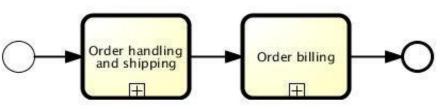

Level 2: timing precision example

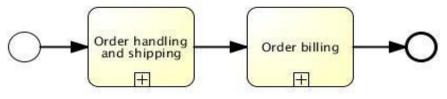

Subprocess vs Call activity

- Subprocess
 - Expandable (nested) part of the process
 - Defined inside process
 - Nested for better readability

- Activity call
 - Call of global task or process
 - Defined as a separate process, then imported
 - Reusable in other processes

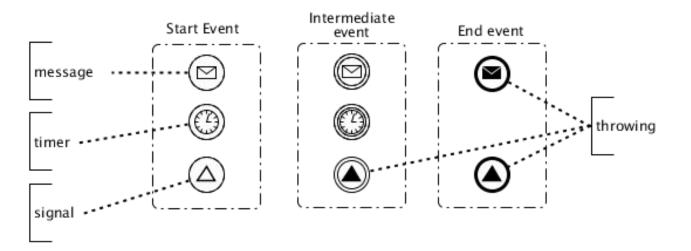

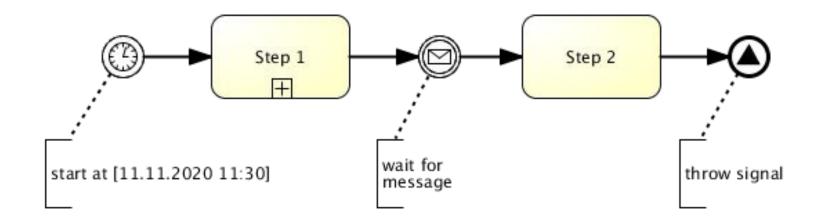

Event types: Basic types

• Start events

- Event initiate process/subprocess
- One (or more in special cases)
- Always catching
- Intermediate events
 - Occur during process
 - Can be throwing or catching
- End events
 - Occur at the end of process flow
 - Always throwing
 - End affect only one branch (except Terminate)

Event types - Examples

	Events	ents			l	End			
Events Downloaded from:	Lvenes	Top-Level	Event Sub-Process Interrupting	Event Sub-Process Non-Interrupting	Catching	Boundary Interrupting	Boundary Non- Interrupting	Throwing	
http://frapu.de/blog/index.php?m=07&y=09&d=01&entry=entry090701-211320	None: Untyped events, indicate start point, state changes or final states.	\bigcirc			 			\bigcirc	Ο
	Message: Receiving and sending messages.		\square		\bigcirc	\bigcirc			
	Timer: Cyclic timer events, points in time, time spans or timeouts.	\bigcirc	\bigcirc	Ó	\bigcirc	\bigcirc	Ó		
	Escalation: Escalating to an higher level of responsibility.	 	\bigcirc	$(\widehat{\mathbb{A}})$	 				\oslash
	Conditional: Reacting to changed business conditions or integrating business rules.								
	Link: Off-page connectors. Two corresponding link events equal a sequence flow.	 	 		\bigcirc	 +		\bigcirc	
	Error: Catching or throwing named errors.		\bigotimes	 	 	\oslash			\oslash
	Cancel: Reacting to cancelled transactions or triggering cancellation.	 	 	 	 	\bigotimes			\otimes
	Compensation: Handling or triggering compensation.				 				
	Signal: Signalling across differ- ent processes. A signal thrown can be caught multiple times.	\bigcirc	\bigcirc	$(\widehat{\bigtriangleup})$	\bigcirc	\bigcirc			
	Multiple: Catching one out of a set of events. Throwing all events defined	\bigcirc	\bigcirc		\bigcirc	\bigcirc			
	Parallel Multiple: Catching all out of a set of parallel events.	(+)	(+)	$(\widehat{\mathbb{G}})$	(\mathbf{F})	(\mathbf{F})			
	Terminate: Triggering the immediate termination of a process.								

Event types: Catching vs. Throwing

Throwing

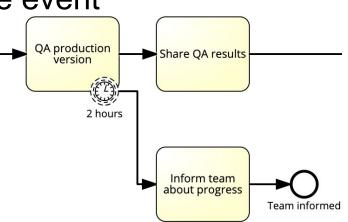

- Emits the event
- Flow continues immediately
- Catching
 - Catch the event
 - Flow waits for the event

Event types: Interrupting vs non-interrupting

- Interrupting
 - Standard process flow is interrupted
 - Flow is directed through the event
- Non-interrupting
 - Standard flow continues normally
 - Parallel flow is directed through the event

Subprocess B

Subprocess A

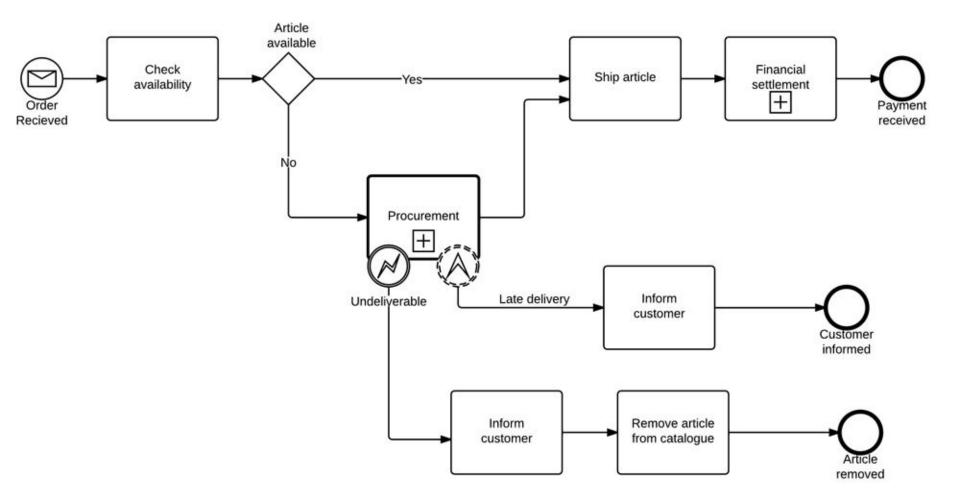

+

Handle Timeout

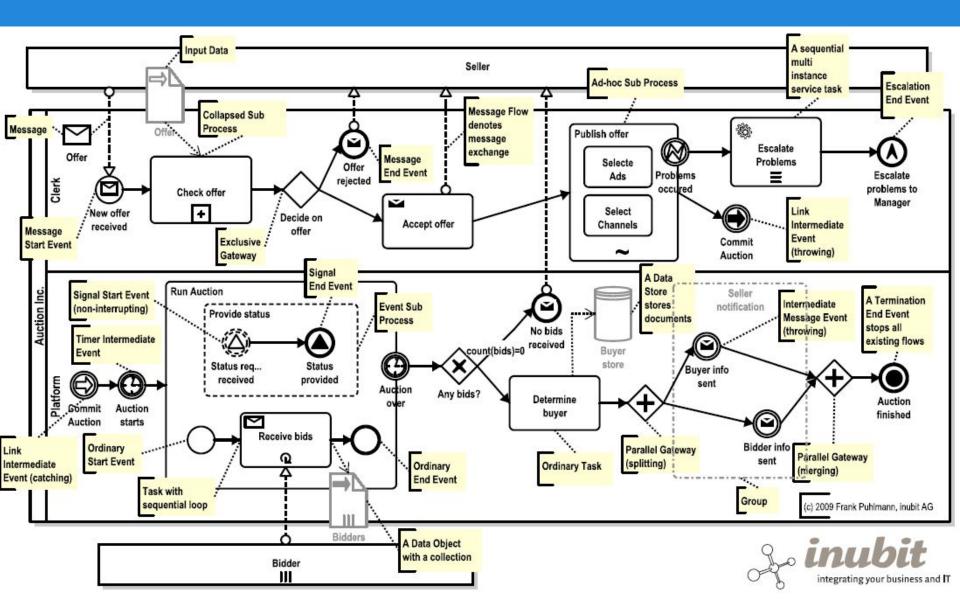

+

(Ô)

Event types: Interrupting vs non-interrupting

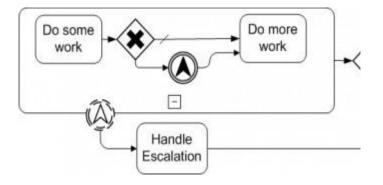

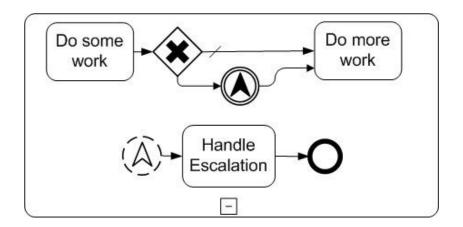

Break 10mins

	Events	ents			l	End			
Events Downloaded from:	Lvenes	Top-Level	Event Sub-Process Interrupting	Event Sub-Process Non-Interrupting	Catching	Boundary Interrupting	Boundary Non- Interrupting	Throwing

	Compensation: Handling or triggering compensation.				 				
	Signal: Signalling across differ- ent processes. A signal thrown can be caught multiple times.	\bigcirc	\bigcirc	$(\widehat{\bigtriangleup})$	\bigcirc	\bigcirc			
	Multiple: Catching one out of a set of events. Throwing all events defined	\bigcirc	\bigcirc		\bigcirc	\bigcirc			
	Parallel Multiple: Catching all out of a set of parallel events.	(+)	(+)	$(\widehat{\mathbb{G}})$	(\mathbf{F})	(\mathbf{F})			
	Terminate: Triggering the immediate termination of a process.								

Event semantics: Messages

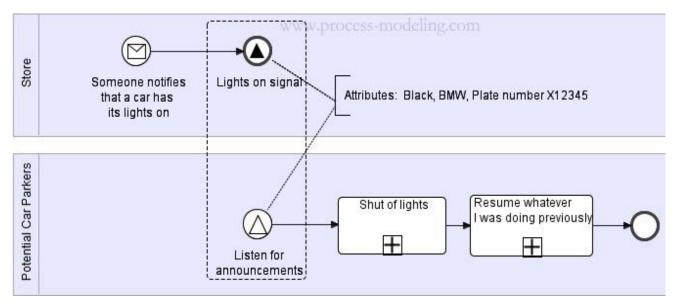

- Message represents a message send by external entity ~ Pool
 - Messaging is for interprocess communication
 - \circ $\,$ Inside the process use sequence flow instead
- Message does not have to be JMS, SOAP etc. but it can be fax, mail, SMS etc.
- A Message can be received and start process
- A message can occur as intermediate event
- A message can be sent at the end of process

Event semantics: Message - examples

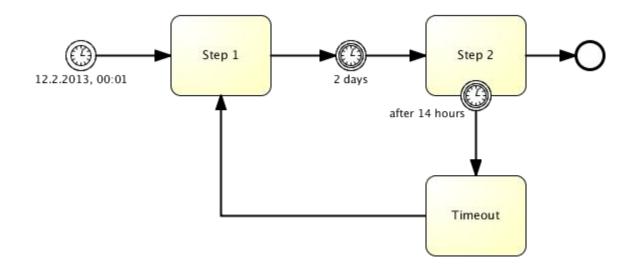

Event semantics: Signals

- Signal is similar to message, except
 - Is not addressed to any particular consumer
 - Entity producing signal does not "care" who is listening
 - Many instances of the same process can consume it
 - Good for loosely coupled communication
 - Signals are used often inside one process, messages not

Event semantics: Timer

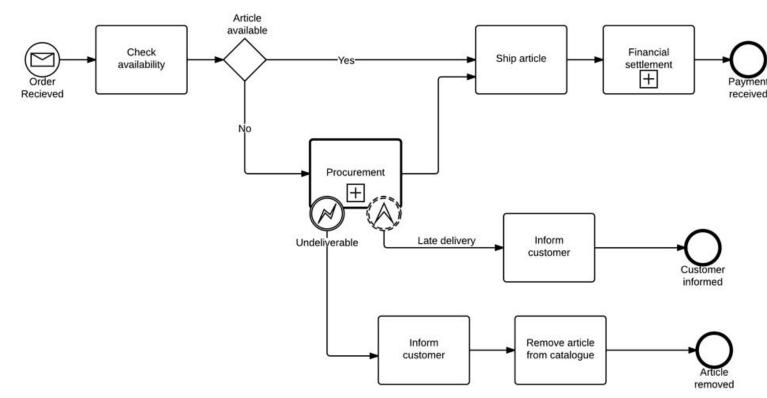

- Cyclic events
- Points in time
- Timeouts

Event semantics: Escalations

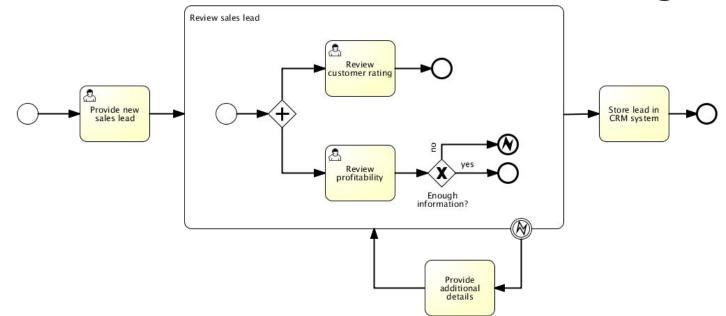

- Handling unusual but expected behaviour
 - Corrective actions (interrupting)
 - Additional steps to be done in parallel (non-interrupting)

Event semantics: Errors

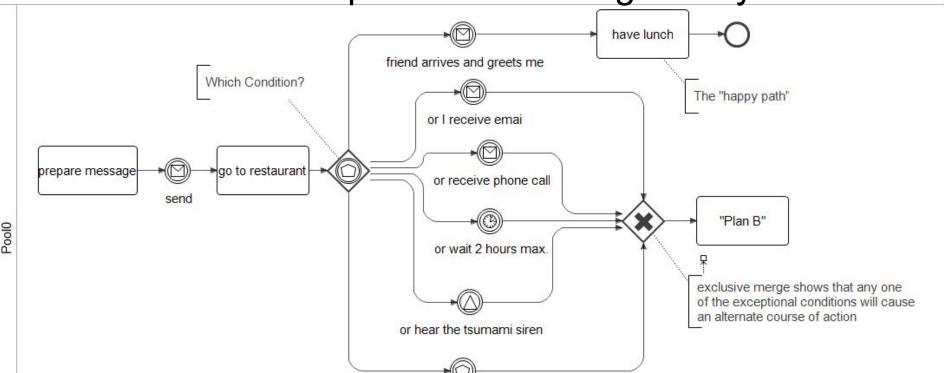

- Used for serious problem in process
- Throw catch mechanism
 - Always interrupting
 - Always boundary event
- There should be some error handling actions

Event-based gateway

- Event-based gateway
 - Branching based on event, only one triggered
 - Different semantics branched according to event that is placed after the gateway

Multi-instance and Loop activity

• Multi-instance

Loop

 Shortcut for a number (dynamically defined) of the same activities that run in parallel or in series.

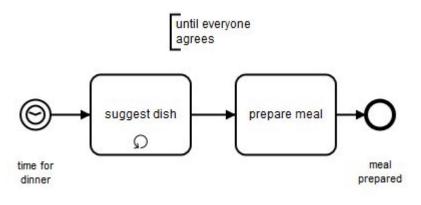

Shortcut for a repeating

one activity until a

condition is met.

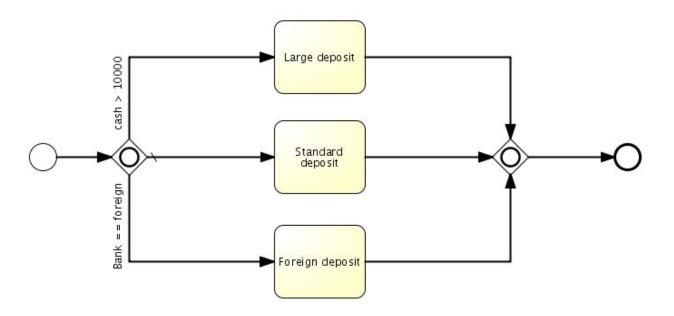

Recap: Inclusive OR-gateway

- One or more branches can be performed
- Depends on conditions
- Branches performed in parallel
- Waiting for all **activated** branches

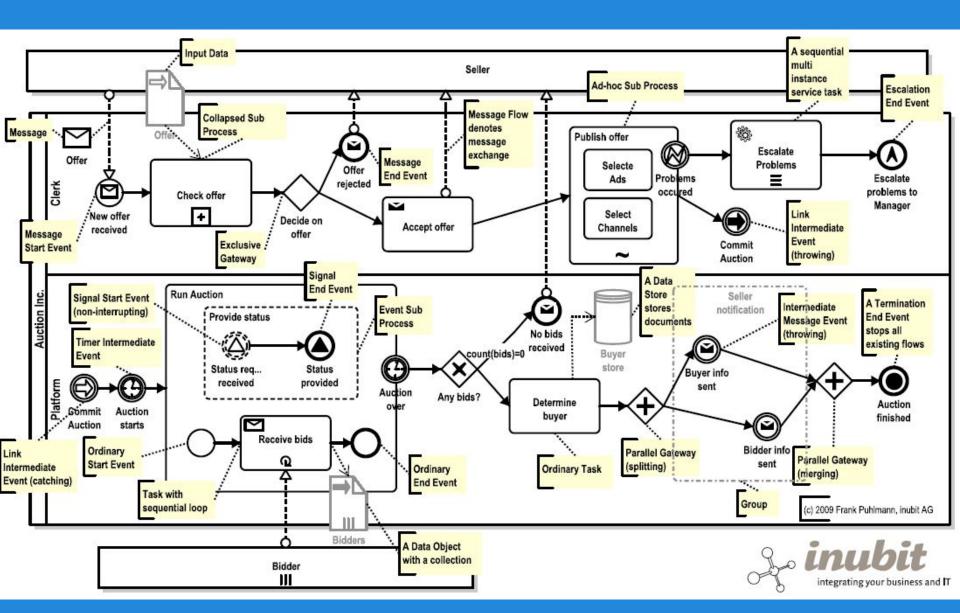

What is in not covered here

- Transactional events
 - Compensations
 - Cancellations events
 - Rollbacks
- Other diagrams covered in BPMN 2.0 specs
 - Choreography diagrams
 - Conversation diagrams

BPMN L2 summary
