## IAoo8: Computational Logic

### 6. Inductive Inference

Achim Blumensath blumens@fi.muni.cz

Faculty of Informatics, Masaryk University, Brno

# **Basic Concepts**

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

What is the next number?

0,

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

What is the next number?

0, 1,

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

What is the next number?

0, 1, 1,

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

What is the next number?

0, 1, 1, 2,

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

What is the next number?

0, 1, 1, 2, 3,

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

```
0, 1, 1, 2, 3, 5,
```

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

$$a_n = a_{n-2} + a_{n-1}$$

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

0,

0, 1, 1, 2, 3, 5, 8,... 
$$a_n = a_{n-2} + a_{n-1}$$

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

What is the next number?

0, 1, 1, 2, 3, 5, 8,... 
$$a_n = a_{n-2} + a_{n-1}$$

0, 0,

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

What is the next number?

0, 1, 1, 2, 3, 5, 8,... 
$$a_n = a_{n-2} + a_{n-1}$$

0, 0, 0,

learning general facts from examples:

Induction is the process of forming of a hypothesis (about a target concept/function) based on observed data.

### **Example**

What is the next number?

0, 1, 1, 2, 3, 5, 8,... 
$$a_n = a_{n-2} + a_{n-1}$$

0, 0, 0, 0,

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

0, 1, 1, 2, 3, 5, 8,... 
$$a_n = a_{n-2} + a_{n-1}$$

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

0, 1, 1, 2, 3, 5, 8,... 
$$a_n = a_{n-2} + a_{n-1}$$

learning general facts from examples:

**Induction** is the process of forming of a **hypothesis** (about a **target concept/function**) based on **observed data**.

### **Example**

0, 1, 1, 2, 3, 5, 8,... 
$$a_n = a_{n-2} + a_{n-1}$$
  
0, 0, 0, 0, 0, 120, 720,...  $a_n = n(n-1)(n-2)(n-3)(n-4)$ 

### **Fundamental Problem**

From a strictly logical point of view, induction is **not possible**: there are always several possible explanations for the observed phenomena and there is no rational basis for choosing one over the others. Hence, a hypothesis can be **falsified** but never **verified**.

Consequently we need to make additional a priori assumptions (the so-called inductive bias) regarding the target concept.

#### **Inductive Learning Hypothesis**

A hypothesis that approximates the target concept well over a sufficiently large amount of training data will also approximate it well over unobserved examples.

#### Occam's Razor

Use the **simplest** hypothesis that matches the observations. (What's simple depends on our formalism.)

## Philosophy of Science

#### Scientific Method

In the 17th century, Francis Bacon, René Descartes, and Isaac Newton developed the scientific method based on induction.

#### **Problem of Induction**

**David Hume** was the first to point out that inductive inferences are unprovable and always subject to falsification.

### **Falsifiability**

**Karl Popper** argued that induction does not exist. Instead science is based on **conjecture** and **criticism**. One should select hypotheses that are the easiest to falsify.

### **Paradigm Shift**

**Thomas Kuhn** viewed science as a **social process**. He emphasised the role of **paradigms** and the way they are replaced when sufficiently many observations point to problems with the current paradigm.

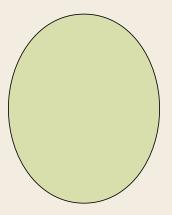

## **Machine Learning**

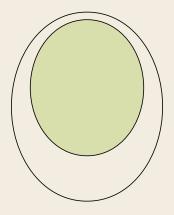

Induction (and learning in general) works best if it is interactive:

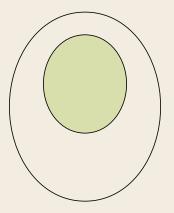

- form a hypothesis based on the current data
- test the hypothesis on new data
- repeat

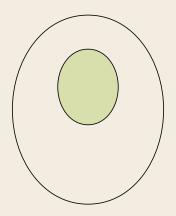

The question therefore is not whether the hypothesis is **true**, but **how well** it predicts observations.

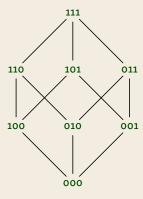

Most decent algorithms for inference use **statistical methods** and fall outside the scope of this course.

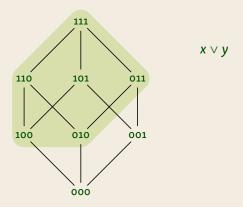

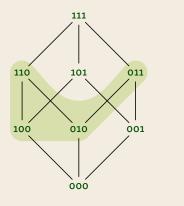

## **Boolean Functions**

### **Boolean functions**

In this lecture we will concentrate on learning boolean functions

$$f: \{0,1\}^n \to \{0,1\}$$

(which can be encoded as propositional formulae)

X <sub>1</sub>	Х2	<i>x</i> <sub>3</sub>	x <sub>4</sub>	<i>x</i> <sub>5</sub>	х <sub>6</sub>	x <sub>7</sub>	Х8	х <sub>9</sub>	X <sub>10</sub>	$ f(\bar{x}) $
0	1		1							$$
1	0	1	О						1	
1	1	0	0	1	1	1		1		×
0	0	0	0	1		О		1	0	
0	0	0	1	1	0	0	1	1	0	
0	1	1	1	0	1	1	0	1	1	×
0	1	0	0	1	0	0	1	0	0	$$

### Setting

Learning a boolean function  $f: \{0, 1\}^n \to \{0, 1\}$  using as hypotheses **conjunctions**  $\eta := x_i \wedge \cdots \wedge \neg x_k$  of literals.

### General-to-specific ordering

 $\eta$  is more specific than  $\zeta$  if  $\eta \models \zeta$ .

#### Idea

#### **Setting**

Learning a boolean function  $f: \{0, 1\}^n \to \{0, 1\}$  using as hypotheses **conjunctions**  $\eta := x_i \wedge \cdots \wedge \neg x_k$  of literals.

### General-to-specific ordering

$$\eta$$
 is more specific than  $\zeta$  if  $\eta \models \zeta$ .

#### Idea

### General-to-specific ordering

 $\eta$  is more specific than  $\zeta$  if  $\eta \models \zeta$ .

#### Idea

## Find-S algorithm

- ▶ Start with  $\eta := \bot$
- Consider the next positive example  $\bar{b}$
- If  $\eta(\bar{b})$  is true, continue.
- Otherwise, find the most specific  $\zeta$  such that  $\eta \models \zeta$  and  $\zeta(\bar{b})$  is true.
- Continue with  $\eta := \zeta$ .

This algorithm computes find the least conjunction with respect to the  $\models$ -ordering that covers all positive examples.

If any of the negative examples is also covered, the training data cannot be described by a conjunction.

\eta_{4} := \neg x_{1} \land \neg x_{3} \land x_{5}$$

#### Hypothesis space

**Goal** Compute all hypotheses consistent with the data.

Let  $D \subseteq \{0, 1\}^n \times \{0, 1\}$  be the observed data and H the set of all hypotheses consistent with every datum in D.

We compute the sets  $H^+$  and  $H^-$  of maximal/minimal elements of H (with respect to the general-to-specific order  $\models$ ).

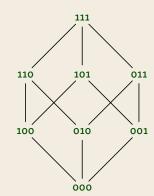

#### **Candidate-Elimination Algorithm**

- ▶ Start with  $H^+ := \{ \top \}$  and  $H^- := \{ \bot \}$ .
- ▶ For each positive  $d \in D$ :
  - ▶ Delete from  $H^+$  every hypothesis  $\eta$  with  $\eta(d) = 0$ .
  - ▶ Replace every  $\eta \in H^-$  with  $\eta(d) = 0$  by the set of all minimal  $\zeta$  such that

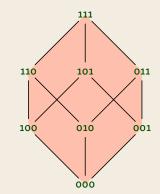

$$\eta \models \zeta$$
,  $\zeta(d) = 1$ , and  $\zeta \models \eta'$ , for some  $\eta' \in H^+$ .

- ▶ Remove from H<sup>-</sup> all elements that are not minimal.
- ▶ For each negative  $d \in D$ : proceed analogously with  $H^+$  and  $H^-$  interchanged.

0	0	1	0	0	1	0	
0	0	0	1	1	0	1	×
1	1	0	1	1	0	0	
1	0	1	0	1	0	0	

#### **Decision Trees**

Organise the function to be learned as a tree.

								0 1
X <sub>1</sub>	X <sub>2</sub>	<i>x</i> <sub>3</sub>	<i>x</i> <sub>4</sub>	x <sub>5</sub>	х <sub>6</sub>	<i>x</i> <sub>7</sub>	$ f(\bar{x}) $	0 1
1	0	1	1	1	0	1		
0	1	0	0	0	1	1	X	0/\1 X
1	1	1	1	1	1	0		<b>6</b>
0	0	1	0	0	1	0		X
0	0	0	1	1	0	1	X	
1	1	0	1	1	0	0	$\sqrt{}$	
1	0	1	0	1	0	0	$$	

The order of the variables  $x_i$  matters. Which one do we choose?

### **Ordered Binary Decision Diagrams (OBDDs)**

- data structure to compactly represent a boolean function
- the arguments are **ordered**  $x_1, \ldots, x_n$
- the graph is reduced: merge isomorphic subgraphs and eliminate unneeded vertices

$$(x_1 \wedge x_3) \vee (x_2 \wedge x_3) \vee \neg (x_1 \vee x_2 \vee x_3)$$
