The class is practically orented – GPU is constant-times faster than CPU, therefore besides time complexity, writing an optimal code is important.

About The Class ○●○○○	Motivation	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions
What is ex	pected fro	m you			

During the semester, you will work on a practically oriented project

- important part of your total score in the class
- the same task for everybody, we will compare speed of your implementation
- 50 + 20 points of total score
  - working code: 25 points
  - efficient implementation: 25 points
  - speed of your code relative to your class mates: 20 points (only to improve your final grading)

Exam (oral or written, depending on the number of students)

50 points

About The Class ○○●○○	Motivation	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions
Grading					

For those finishing by exam:

- A: 92–100
- B: 86–91
- C: 78–85
- D: 72–77
- E: 66–71
- F: 0-65 pts

For those finishing by colloquium:

• 50 pts

< ∃ >

About The Class	Motivation	GPU Architecture	CUDA	Sample Code	Conclusions
	•0000000000				
Motivation	n – Moore's				

#### Moore's Law

Number of transistors on a single chip doubles every 18 months

Corresponding growth of performance comes from

- **in the past:** frequency increase, parallelism of instructions, of-of-order instruction processing, caches, etc.
- today: vector instructions, increase in number of cores

About The Class	Motivation ○●○○○○○○○○○	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions
Motivation	- paradig	m change			

Moore's Law consequences:

- in the past: speed of a single-threaded program doubled each 18 months
  - changes were important for compiler developers; application developers didn't need to worry
- **today**: speed of prcessing of a parallel program having sufficient number of processes/threads doubles every 18 months
  - in order to utilize state-of-the-art processors, it is necessary to devleop parallel algorithms
  - it is necessary to find parallelism in the problem being solved, which is a task for a programmer, not for a compiler (at least for now)

About The Class	Motivation	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions
Mativation	- Tupos d	f Darallolicm			

#### • Task parallelism

- decomposition of a task into the problems that may be processed in parallel
- usually more complex tasks performing different actions
- ideal for small number of high-performance processor goals
- more frequent (and complex) synchronization, usually
- Data parallelism
  - paralellism on the level of data structures
  - usually the same operations on many items of a data structure
  - finer-grained parallelism allows for simple construction of individual processors

About The Class	Motivation 000●0000000	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions
Motivation	- Types d	f Parallelism			

- from programmer's perspective
  - different paradigm requires different approach to algorithm design
  - some problems are rather data-parallel, some task-parallel
- from hardware perspective
  - processors for data-parallel tasks may be simpler
  - it si possible to achieve higher arithmetic performance with the same number of processors
  - simpler memory access patterns allow for high-throughput memory designs

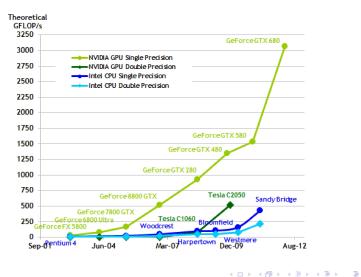

About The Class	Motivation ○○○○●○○○○○○	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions

Motivation	Motivation – Summary								

### • GPUs are powerful

- an order of magnitude performance increase is worth studying a new programming model
- for full utilization of modern GPUs and CPUs, parallel programming is necessary
  - parallel architecture of GPUs ceases to be an order of magnitude harder to master
- GPUs are widespread
  - cheap
  - lots of users have a desktop supercomputer

About The Class	Motivation 00000000●00	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions
Motivation	– Applica	tions

Motivation	– Applica	tions			

SW developers are still a sought-for scarce resource... SW developers capable of parallel SW development are extremely sought-for scarce resource

About The Class	Motivation 000000000●0	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions				
Motivation – Applications									

SW developers are still a sought-for scarce resource...

SW developers capable of parallel SW development are extremely sought-for scarce resource

A lot of existing software is not parallel

- it is necessary to make it parallel in order to increase performance
- and somebody has to do it :-)

About The Class	Motivation ○○○○○○○○○●	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions
Historic Ex	cursion				

- SIMD model since '60s
  - Solomon project by Westinghouse company at the beginning of '60s
  - transferred to University of Illinois as ILLIAC IV
  - separate ALU for each data element massively parallel
  - original plan: 256 ALUs, 1 GFLOPS
  - finished in 1972, 64 ALUs, 100-150 MFLOPS
- in '80s–90s: vector supercomputers, TOP500
- in todays CPUs: SSE (x86), ActiVec (PowerPC)
- Cg: programming vertex and pixel shaders in graphics grads (cca 2003)
- CUDA: general GPU programming, SIMT model (first released on 15. February 2007)
- future?
  - OpenCL
  - higher programming languages, automatic parallelization

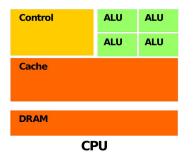

About The Class	Motivation	GPU Architecture ●000000	<b>CUDA</b> 000000	Sample Code	Conclusions
GPU Archit	ecture				

#### CPU vs. GPU

- couple of cores vs. vs. tens of multiprocessors
- out of order vs. in order
- MIMD, SIMD short vectors vs. SIMT for long vectors
- large cache vs. small cache, often read-only

GPU uses more transistors for computating units then for cache and control  $\implies$  higher performance, less flexibility

Within the system:

- co-processor with dedicated memory
- asychnornous processing of instructions
- attached using PCI-E to the rest of the system

About The Class	Motivation	GPU Architecture ○○○●○○○	<b>CUDA</b> 000000	Sample Code	Conclusions
G80 Proces	ssor				

### G80

- first CUDA processor
- 16 multiprocessors
- each multiprocessor
  - 8 scalar processors
  - 2 units for special functions
  - up to 768 threads
    - HW for thread switching and scheduling
  - threads are grouped into warps by 32
    - SIMT
  - native synchronization within the multiprocessor

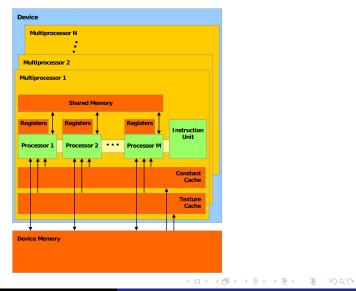

About The Class	Motivation	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions
G80 Memor	ry Model				

Memory model

- 8192 registers shared among all threads of a multiprocessor
- 16 kB of shared memory
  - local within the multiprocessor
  - as fast as registry (under certain constraints)
- o constant memory
  - cached, read-only
- texture memory
  - cached with 2D locality, read-only
- global memory
  - non cached, read-write
- data transfers between global memory and system memory through PCI-E

About The Class	Motivation	GPU Architecture ○○○○○●○	<b>CUDA</b> 000000	Sample Code	Conclusions

### G80 Processor

Jiří Filipovič Introduction, CUDA Basics

About The Class	Motivation	GPU Architecture ○○○○○○●	<b>CUDA</b> 000000	Sample Code	Conclusions
Further Development					

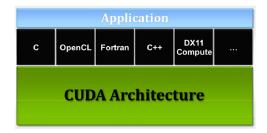

Processors based on G80

- double-precision calculations
- relaxed rules for efficient memory access to global memory
- more of on-chip resources (more registers, more threads per MP)
- better sychronization options (atomic operations, warp voting) Fermi
  - higher parallelization on multiprocessor level (more cores, two warp schedulers, higher double-precission performance)
  - configurable L1 and shared L2 cache
  - flat address space
  - better floating point precision
  - parallel run of kernels
  - better synchronization tools
  - other changes stemming from a different architecture

About The Class	Motivation	GPU Architecture	<b>CUDA</b> ●00000	Sample Code	Conclusions
CUDA					

CUDA (Compute Unified Device Architecture)

- architecture for parallel computations developed by Nvidia
- provides a new programming model, allows efficient implementation of general GPU computations
- may be used in multiple programming languages

About The Class	Motivation	GPU Architecture	<b>CUDA</b> ○●○○○○○	Sample Code	Conclusions
C for CUD	4				

C for CUDA is extension of C for parallel computations

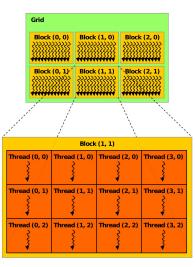

- $\bullet$  explicit separation of host (CPU) and device (GPU) code
- thread hierarchy
- memory hierarchy
- synchronization mechanisms
- API

About The Class	Motivation	GPU Architecture	<b>CUDA</b> 00●000	Sample Code	Conclusions
Thread Hie	rarchy				

Thread hierarchy

- threads are organized into blocks
- blocks form a grid
- problem is decomposed into sub-problems that can be run independently in parallel (blocks)
- individual sub-problems are divided into small pieces that can be run cooperatively in parallel (threads)
- scales well

About The Class	Motivation	GPU Architecture	<b>CUDA</b> 000●00	Sample Code	Conclusions
Thread Hie	rarchy

Thread an	d Block Id	entification			

C for CUDA has built-in variables:

- threadIdx.{x, y, z} tells position of a thread in a block
- blockDim.{x, y, z} tells size of the block
- **blockIdx**.{**x**, **y**, **z**} tells position of the block in grid (z always equals 1)
- gridDim.{x, y, z} tells grid size (z always equals 1)

About The Class	Motivation	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions

About The Class	Motivation	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions
GPU Memo	ory Manag	gement			

It is necessary to allocate the memory dynamically.

```
cudaMalloc(void** devPtr, size_t count);
```

allocates memory of the *count* size and sets the pointer *devPtr* to it. To release the memory:

```
cudaFree(void* devPtr);
```

To copy the memory:

```
cudaMemcpy(void* dst, const void* src, size_t count,
enum cudaMemcpyKind kind);
```

copies *count* bytes from *src* to *dst*, *kind* determins copying direction (e.g., *cudaMemcpyHostToDevice*, or *cudaMemcpyDeviceToHost*).

cudaMalloc((void**)&d_b, N*sizeof(*d_b));
cudaMalloc((void**)&d_c, N*sizeof(*d_c));
cudaMemcpy(d_a, a, N*sizeof(*d_a), cudaMemcpyHostToDevice);
cudaMemcpy(d_b, b, N*sizeof(*d_b), cudaMemcpyHostToDevice);
// the kernel will be run here
cudaMemcpy(c, d_c, N*sizeof(*c), cudaMemcpyDeviceToHost);
cudaFree(d_a);
cudaFree(d_b);
cudaFree(d_c);
```

イロト イヨト イヨト イヨト

About The Class	Motivation	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions
An Exampl	e – Sum o	of Vectors			

Running the kernel:

- kernel is called as a function; between the name and the arguments, there are three brackets with specification of grid and block size
- we need to know block size and their count
- we will use 1D block and grid with fixed block size
- the size of the grid is determined in a way to compute the whole problem of vector sum

For vector size dividable by 32:

```
#define BLOCK 32
addvec<<<N/BLOCK, BLOCK>>>(d_a, d_b, d_c);
```

How to solve a general vector size?

About The Class	Motivation	GPU Architecture	<b>CUDA</b> 000000	Sample Code	Conclusions
An Examp	le – Sum o	of Vectors			

## We will modify the kernel source:

```
__global__ void addvec(float *a, float *b, float *c, int n){
    int i = blockIdx.x*blockDim.x + threadIdx.x;
    if (i < n) c[i] = a[i] + b[i];
}</pre>
```

## And call the kernel with sufficient number of threads:

```
addvec \ll N/BLOCK + 1, BLOCK \gg (d_a, d_b, d_c, N);
```

• E • • E •
