### Content-Based Annotation and Classification Framework: A General Multi-Purpose Approach

#### Michal Batko, Jan Botorek, Petra Budikova, Pavel Zezula

Laboratory of Data Intensive Systems and Applications Faculty of Informatics, Masaryk University, Brno

#### **IDEAS 2013**

#### Outline

- Motivation
  - Why annotations?
  - State-of-the-art in multimedia annotation
- General annotation model
  - Global architecture
  - Application to selected tasks
  - Specification of components
- Web image annotation
  - Current implementation
  - Experimental evaluation
- Conclusions and future research directions

#### **Motivation**

Yellow flower

#### dandelion

#### nature

Taraxacum officinale

Flower, yellow, dandelion, detail, close-up, nature, plant, beautiful

The first dandelion that bloomed this year in front of the White House.

"Image is worth a thousand words."

# Why do we need the thousand words?

- Keyword-based image retrieval
  - Popular and intuitive
  - Needs pictures with text metadata, we do not want to create them manually
- Information seeking: "What is in the photo I just took?"
  - Tourist information / Plant identification / ...
- Impaired users
- Classification tasks
  - Scientific data (medicine, astronomy, chemistry, ...)
  - Improper content identification
  - Personal image gallery
- Data summarization: "What images are on this computer?"
- Not only images!
  - Sound, video, ....

### Several dimensions of the annotation problem

- Input
  - Image / Image and seed keyword / Image and text / Text
- Type of information needed
  - Identification / Detection / Categorization
- Vocabulary
  - Unlimited vocabulary / Controlled vocabulary
- Form of annotation required
  - Sentence / Set of keywords / All relevant categories / A single category / Localization in a taxonomy
- Interactivity
  - Online / offline annotation
- **Easy tasks**: identify a single relevant category from a short list
- Difficult tasks: wide (unlimited) vocabulary, "all relevant needed", online processing, very little or no input text

#### State-of-the-art text-extraction techniques

- Pure text-based
  - Analyze the text on a surrounding web page
- Content-based / Content- and text-based
  - Mainly exploit visual properties (+ text when available)
- Content-based annotation scenario:
  - Basic annotation
    - Model-based: train a model for each concept in vocabulary
    - Search-based: kNN search in annotated collection
  - Annotation refinement
    - Statistical
    - Ontology-based
    - Secondary kNN search

• ...

### Existing approaches – summary

- Model-based techniques:
  - + Specialized classifiers can achieve high precision
  - + Fast processing
  - Training feasible only for a limited number of concepts feasible, high-quality training data needed
- Search-based techniques:
  - + Can exploit vast amounts of annotated data available online
  - + No training needed, no limitation of vocabulary
  - Costly processing when large datasets need to be searched
  - Content-based similarity measures often not precise enough
- Summary of state-of-the-art:
  - Mostly specialized solutions for a specific type of application
  - Reasonable results only for simple tasks

#### Our approach

- Facts
  - Experiments show that state-of-the-art solutions are not very successful for complex problems
  - Psychologic research suggests hierarchical annotation
- Our vision:
  - Broad-domain annotation is a complex process, needs to be modeled as such
    - Multiple processing phases
    - Modular design
    - Hierarchic annotation
    - Combine multiple knowledge sources
    - User in the loop
  - The same infrastructure can be used for different applications (annotation, classification, ...)
    - The principal components are the same
    - Easy evaluation, comparisons

#### General annotation model

# General annotation model (cont.)

- Framework components
  - Query
    - Image / image + text / (text)
  - Knowledge sources
    - Annotated image collection, WordNet, ontologies, internet, ..., user
  - Annotation-record
    - Query + candidate keywords, weights, any other knowledge
  - Processor modules
    - Expander, transformer, reducer
  - Evaluation scenarios
- Properties
  - Clear structure, modularity
  - Can be adapted to various annotation/classification tasks
  - Supports extensive experiments, comparison of techniques

# Simple examples

Basic search-based annotation

# Advanced example: Hierarchic image annotation

### **Processing modules**

"The brain of the annotation process"

- Expanders
  - Provide candidate keywords
  - Visual-based nearest-neighbor search
    - Similarity measured by MPEG-7 global descriptors
    - Metric search provided by efficient M-index structure
    - Knowledge source: annotated image collection
  - Face detection software
    - Luxand FaceSDK
      - commercial library for detection and recognition of faces
    - Depending on number of faces detected, people-related concepts are added to annotation-record

### Processing modules (cont.)

- Transformers
  - Adjust weights of candidate keywords
  - Basic weight transformer
    - Frequency of a keyword in the descriptions of similar images
    - Similarity score of each image with the particular keyword
    - Knowledge source: descriptions of similar images
  - Semantic transformer
    - Uses WordNet hierarchies to cluster related words
    - Keyword weight increased proportionately to the size of containing cluster
    - Knowledge source: WordNet
- Reducers
  - Remove unsuitable candidates
  - Syntactic cleaner
    - Stopword removal, translation, spell-correction
    - Knowledge sources: WordNet, dictionaries, Wikipedia

### Web image annotation problem

#### Task specification

"Given an image, provide the *K* most relevant keywords that describe the content of this image."

- Use case
  - A professional photographer uploading images to a photo-selling site needs to provide accompanying keywords to enable text search

#### Basic solution

Budikova, Batko, Zezula: Online image annotation. SISAP 2011.

# Web image annotation problem (cont.)

A more complex solution

### Web image annotation – evaluation

#### Methods under comparison

- Original search-based annotation
- Cleaned keywords
- Boosting by distance
- Clustering by WordNet meaning
- Face detector boosting
- Face detector enrichment
- Evaluation methodology
  - 160 test queries
    - Categories easy/medium/difficult
    - 20 best keywords requested
  - Result relevance evaluation:
    - User-provided (result relevance assessments)
    - Automatic (comparison to image description provided by author)

# Web image annotation – evaluation (cont.)

#### **Easy query**

entertainment, art, sparkling, event, enjoyment, show, display, air, celebration, festival, flash, level, fireworks, cracker, explosion, fire, excitement, firecracker, light, bang

#### **Medium query**

blossom, location, <u>plant</u>, bird, food, <u>trees</u>, <u>natural</u>, <u>citrus</u>, flowers, generic, antique, destinations, <u>nature</u>, recreation, <u>tree</u>, <u>foliage</u>, <u>botany</u>, <u>fruit</u>, determination, flower

#### **Difficult query**

form, station, <u>antique</u>, <u>interior</u>, <u>frame</u>, <u>bookcase</u>, <u>indoors</u>, group, animal, antiques, snack, <u>person</u>, construction, food, chinese, <u>study</u>, <u>wood</u>, architecture, dynasty, building

# Web image annotation – evaluation (cont.)

original frequency-based annotation
□ cleaned keywords
boosting by distance
clustering by WordNet meaning
clustering and face detector boosting
clustering and face detector enrichment

#### **Processing costs**

Pipeline type	k = 5	k = 10	k = 15	k = 30
original frequency-based annotation	$0.94\mathrm{s}$	1.34 s	$4.35\mathrm{s}$	$7.44\mathrm{s}$
cleaned keywords <sup>a</sup>	$0.94\mathrm{s}$	$1.34\mathrm{s}$	$4.35\mathrm{s}$	$7.44\mathrm{s}$
boosting by distance	$1.04\mathrm{s}$	$1.44\mathrm{s}$	$4.53\mathrm{s}$	$8.15\mathrm{s}$
clustering by WordNet meaning	$1.98\mathrm{s}$	$2.94\mathrm{s}$	$4.52\mathrm{s}$	$13.89\mathrm{s}$
clustering & face detector boosting	$2.24\mathrm{s}$	$3.27\mathrm{s}$	$4.81\mathrm{s}$	$14.47\mathrm{s}$
clustering & face detector enrichment	2.13 s	$3.18\mathrm{s}$	$4.74\mathrm{s}$	$14.33\mathrm{s}$

### Conclusions

- Image annotation remains a challenging task
  - Broad domains, interactive applications, lack of training data, ...
- Our contributions
  - General annotation model & implementation framework
  - Implementation & evaluation of several processing components
  - Improved annotation tool

http://disa.fi.muni.cz/prototype-applications/image-annotation/

- Future work
  - Refinement of semantical analysis
  - Development of new components, hierarchic annotation processing
  - Relevance feedback strategies for image annotation

#### More experimental results

Figure 8: Influence of k on annotation precision (left), Corel dataset evaluation results (right).
