Introduction, CUDA Basics

Jiří Filipovič

Fall 2017

Language

I will speak English if there is any foreign student in the class

expect Slovak :-)

But I understand that

- my English is not perfect
- your English may not be perfect
- so feel free to interrupt me and ask me, if you do not understand

If you do not feel comfortable to ask me in English

• ask me in Czech/Slovak

About the class

About The Class

0000000

The class is focused on algorithm design and programming of general purpose computing applications on many-core vector processors

About the class

The class is focused on algorithm design and programming of general purpose computing applications on many-core vector processors

We will focus to CUDA GPUs first:

- C for CUDA is good for teaching (easy API, a lot of examples available, mature compilers and tools)
- restricted to NVIDIA GPUs and x86 CPUs (with PGI)

About the class

The class is focused on algorithm design and programming of general purpose computing applications on many-core vector processors

We will focus to CUDA GPUs first:

- C for CUDA is good for teaching (easy API, a lot of examples available, mature compilers and tools)
- restricted to NVIDIA GPUs and x86 CPUs (with PGI)

After learning CUDA, we focus to OpenCL

- programming model very similar to CUDA, easy to learn when you already know CUDA
- can be used with various HW devices
- we will focus on code optimizations for x86, Intel MIC (Xeon Phi) and AMD GPUs

The class is practically oriented – besides efficient parallelization, we will focus on writing efficient code.

What is offered

About The Class

00000000

You will learn:

- architecture of NVIDIA and AMD GPUs, Xeon Phi
- architecture-aware design of data-parallel algorithms
- programming in C for CUDA and OpenCL
- performance tuning and profiling
- basic tools and libraries for CUDA GPUs
- use cases

What is expected from you

During the semester, you will work on a practically oriented project

- important part of your total score in the class
- the same task for everybody, we will compare speed of your implementation
- \bullet 50 + 20 points of total score
 - working code: 25 points
 - efficient implementation: 25 points
 - speed of your code relative to your class mates: at most 20 points (only to improve your final grading)

Exam (oral or written, depending on the number of students)

50 points

Grading

About The Class

00000000

For those finishing by exam:

- A: 92-100
- B: 86-91
- C: 78–85
- D: 72-77
- E: 66-71
- F: 0–65 pts

For those finishing by colloquium:

• 50 pts

Materials – CUDA

CUDA documentation (installed as a part of CUDA Toolkit, downloadable from *developer.nvidia.com*)

- CUDA C Programming Guide (most important properties of CUDA)
- CUDA C Best Practices Guide (more detailed document focusing on optimizations)
- CUDA Reference Manual (complete description of C for CUDA API)
- other useful documents (nvcc guide, PTX language description, library manuals, . . .)

CUDA article series, Supercomputing for the Masses

http://www.ddj.com/cpp/207200659

Materials – OpenCL

About The Class

0000000

- OpenCL 1.1 Specification
- AMD Accelerated Parallel Processing Programming Guide
- Intel OpenCL SDK Programming Guide
- Writing Optimal OpenCL Code with Intel OpenCL SDK

Materials – Parallel Programming

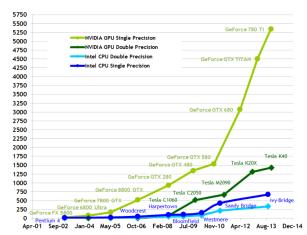

About The Class

0000000

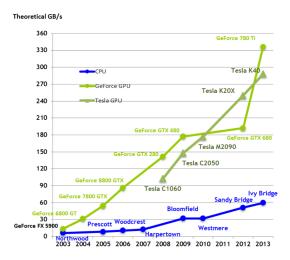

- Ben-Ari M., Principles of Concurrent and Distributed Programming, 2nd Ed. Addison-Wesley, 2006
- Timothy G. Mattson, Beverly A. Sanders, Berna L. Massingill, Patterns for Parallel Programming, Addison-Wesley, 2004

Motivation – GPU arithmetic performance

Theoretical GFLOP/s

Motivation - GPU memory bandwidth

Motivation - programming complexity

OK, GPUs are more powerful, but GPU programming is substantially more difficult, right?

- well, it is more difficult comparing to writing serial C/C++ code...
- but can we compare it to serial code?

Motivation – programming complexity

OK, GPUs are more powerful, but GPU programming is substantially more difficult, right?

- well, it is more difficult comparing to writing serial C/C++ code...
- but can we compare it to serial code?

Moore's Law

Number of transistors on a single chip doubles every 18 months

Motivation – programming complexity

OK, GPUs are more powerful, but GPU programming is substantially more difficult, right?

- well, it is more difficult comparing to writing serial C/C++ code...
- but can we compare it to serial code?

Moore's Law

Number of transistors on a single chip doubles every 18 months

Corresponding growth of performance comes from

- in the past: frequency increase, instruction parallelism, out-of-order instruction processing, caches, etc.
- today: vector instructions, increase in number of cores

Motivation – paradigm change

About The Class

Moore's Law consequences:

- in the past:changes were important for compiler developers;
 application developers didn't need to worry
- today: in order to utilize state-of-the-art processors, it is necessary to write parallel and vectorized code
 - it is necessary to find parallelism in the problem being solved, which is a task for a programmer, not for a compiler (at least for now)
 - writing efficient code for modern CPUs is similarly difficult as writing for GPUs

Sample Code

Important problem from computational chemistry

- we have a molecule defined by position and charges of its atoms
- the goal is to compute charges at a 3D spatial grid around the molecule

In a given point of the grid, we have

$$V_i = \sum_j \frac{w_j}{4\pi\epsilon_0 r_{ij}}$$

Where w_j is charge of the j-th atom, r_{ij} is Euclidean distance between atom j and the grid point i and ϵ_0 is vacuum permittivity.

About The Class

Initial implementation

- suppose we know nothing about HW, just know C++
- algorithm needs to process 3D grid such that it sums potential of all atoms for each grid point
- we will iterate over atoms in outer loop, as it allows to precompute positions of grid points and minimizes number of accesses into input/output array

About The Class

```
void coulomb (const sAtom* atoms, const int nAtoms,
    const float gs, const int gSize, float *grid) {
 for (int a = 0; a < nAtoms; a++) {
    sAtom myAtom = atoms[a];
    for (int x = 0; x < gSize; x++) {
      float dx2 = powf((float)x * gs - myAtom.x, 2.0f);
      for (int v = 0; v < gSize; v++) {
        float dy2 = powf((float)y * gs - myAtom.y);
        for (int z = 0; z < gSize; z++) {
          float dz = (float)z * gs - myAtom.z;
          float e = myAtom.w / sqrtf(dx2 + dy2 + dz*dz);
          grid[z*gSize*gSize + y*gSize + x] += e;
```

About The Class

Execution on 4-core CPU at 3.6 GHz (Sandy Bridge) + GeForce GTX 1070 (Pascal)

 naive implementation 164.7 millions of atoms evaluated per second (MEvals/s)

Sample Code

About The Class

Execution on 4-core CPU at 3.6 GHz (Sandy Bridge) + GeForce GTX 1070 (Pascal)

- naive implementation 164.7 millions of atoms evaluated per second (MEvals/s)
- 476.9 Mevals/s when optimized cache: $2.9 \times$ speedup

Sample Code

About The Class

Execution on 4-core CPU at 3.6 GHz (Sandy Bridge) + GeForce GTX 1070 (Pascal)

- naive implementation 164.7 millions of atoms evaluated per second (MEvals/s)
- 476.9 Mevals/s when optimized cache: 2.9× speedup
- **2,577** Mevals/s when vectorized: $15.6 \times$ speedup

About The Class

Execution on 4-core CPU at 3.6 GHz (Sandy Bridge) + GeForce GTX 1070 (Pascal)

- naive implementation 164.7 millions of atoms evaluated per second (MEvals/s)
- 476.9 Mevals/s when optimized cache: 2.9× speedup
- **2,577** Mevals/s when vectorized: $15.6 \times$ speedup
- 9,914 Mevals/s when parallelized: 60.2× speedup

About The Class

Execution on 4-core CPU at 3.6 GHz (Sandy Bridge) + GeForce GTX 1070 (Pascal)

- naive implementation 164.7 millions of atoms evaluated per second (MEvals/s)
- 476.9 Mevals/s when optimized cache: 2.9× speedup
- **2,577** Mevals/s when vectorized: $15.6 \times$ speedup
- 9,914 Mevals/s when parallelized: 60.2× speedup
- **537,900** Mevals/s GPU version: **3266**× speedup

GPU speedup over already tuned CPU code is $54\times$. However, a lot of existing CPU code is not tuned at all. In this class, you will learn how to tune the code.

Why are GPUs so powerful?

Types of Parallelism

- Task parallelism
 - decomposition of a task into the problems that may be processed in parallel
 - usually more complex tasks performing different actions
 - usually more frequent (and complex) synchronization
 - ideal for small number of high-performance processors
- Data parallelism
 - parallelism on the level of data structures
 - usually the same operations on many items of a data structure
 - finer-grained parallelism allows for simple construction of individual processors

Why are GPUs so powerful?

From programmer's perspective

 some problems are rather data-parallel, some task-parallel (graph traversal vs. edge processing)

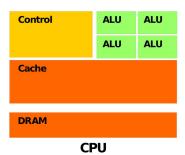

From hardware perspective

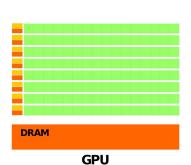

- processors for data-parallel tasks may be simpler
- it is possible to achieve higher arithmetic performance with the same size of processor
- simpler memory access patterns allow for high-throughput memory designs

GPU Architecture

About The Class

GPU Architecture

About The Class

Main differences compared to CPU

- high parallelism: tens thousands threads needed to utilize high-end GPUs
- SIMT model: subsets of threads runs in lock-step mode
- distributed on-chip memory: subsets of threads shares their private memory
- restricted caching capabilities: small cache, often read-only

Algorithms usually need to be redesigned to be efficient on GPU.

GPU Architecture

About The Class

Within the system:

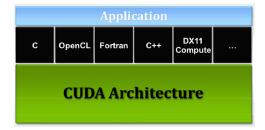

- co-processor with dedicated memory (discrete GPU)
- asynchronous processing of instructions
- attached using PCI-E to the rest of the system (discrete GPU)

CUDA

About The Class

CUDA (Compute Unified Device Architecture)

- architecture for parallel computations developed by NVIDIA
- provides a new programming model, allows efficient implementation of general GPU computations
- may be used in multiple programming languages

G80 Processor

G80

About The Class

- first CUDA processor
- 16 multiprocessors
- each multiprocessor
 - 8 scalar processors
 - 2 units for special functions
 - up to 768 threads
 - HW for thread switching and scheduling
 - threads are grouped into warps by 32
 - SIMT
 - native synchronization within the multiprocessor

G80 Memory Model

About The Class

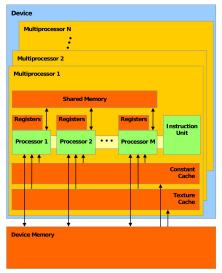

Memory model

- 8192 registers shared among all threads of a multiprocessor
- 16 kB of shared memory
 - local within the multiprocessor
 - as fast as registry (under certain constraints)
- constant memory
 - cached, read-only
- texture memory
 - cached with 2D locality, read-only
- global memory
 - non cached, read-write
- data transfers between global memory and system memory through PCI-E

G80 Processor

About The Class

C for CUDA

About The Class

C for CUDA is extension of C for parallel computations

- explicit separation of host (CPU) and device (GPU) code
- thread hierarchy
- memory hierarchy
- synchronization mechanisms
- API

Sample Code

Thread Hierarchy

About The Class

Thread hierarchy

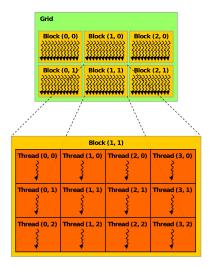

- threads are organized into blocks
- blocks form a grid
- problem is decomposed into sub-problems that can be run independently in parallel (blocks)
- individual sub-problems are divided into small pieces that can be run cooperatively in parallel (threads)
- scales well

Sample Code

Thread Hierarchy

About The Class

Sample Code

Memory Hierarchy

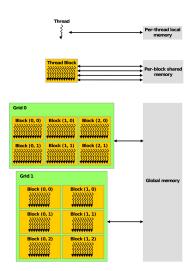

About The Class

More memory types:

- different visibility
- different lifetime
- different speed and behavior
- brings good scalability

Sample Code

About The Class

We want to sum vectors a and b and store the result in vector c

About The Class

We want to sum vectors a and b and store the result in vector c We need to find parallelism in the problem.

About The Class

We want to sum vectors a and b and store the result in vector c. We need to find parallelism in the problem. Serial sum of vectors:

```
for (int i = 0; i < N; i++)
c[i] = a[i] + b[i];
```

Sample Code

• 00000000000

We want to sum vectors a and b and store the result in vector c. We need to find parallelism in the problem. Serial sum of vectors:

```
for (int i = 0; i < N; i++)
c[i] = a[i] + b[i];
```

Individual iterations are independent – it is possible to parallelize, scales with the size of the vector.

We want to sum vectors a and b and store the result in vector c We need to find parallelism in the problem. Serial sum of vectors:

```
for (int i = 0; i < N; i++)
c[i] = a[i] + b[i];
```

Individual iterations are independent — it is possible to parallelize, scales with the size of the vector. i-th thread sums i-th component of the vector:

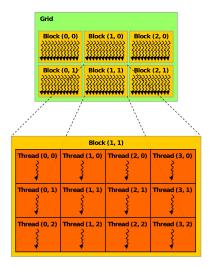

```
c[i] = a[i] + b[i];
```

How do we find which thread we are?

Thread Hierarchy

About The Class

Sample Code

Thread and Block Identification

About The Class

C for CUDA has built-in variables:

- threadIdx.{x, y, z} tells position of a thread in a block
- blockDim.{x, y, z} tells size of the block
- blockldx.{x, y, z} tells position of the block in grid (z always equals 1)
- gridDim.{x, y, z} tells grid size (z always equals 1)

About The Class

Thus we calculate the position of the thread (grid and block are one-dimensional):

About The Class

Thus we calculate the position of the thread (grid and block are one-dimensional):

```
int i = blockIdx.x*blockDim.x + threadIdx.x;
```

Thus we calculate the position of the thread (grid and block are one-dimensional):

```
int i = blockIdx.x*blockDim.x + threadIdx.x;
```

Whole function for parallel summation of vectors:

```
__global__ void addvec(float *a, float *b, float *c){
  int i = blockIdx.x*blockDim.x + threadIdx.x;
  c[i] = a[i] + b[i];
}
```

Thus we calculate the position of the thread (grid and block are one-dimensional):

```
int i = blockIdx.x*blockDim.x + threadIdx.x;
```

Whole function for parallel summation of vectors:

```
__global__ void addvec(float *a, float *b, float *c){
  int i = blockIdx.x*blockDim.x + threadIdx.x;
  c[i] = a[i] + b[i];
}
```

The function defines so called kernel; we specify how meny threads and what structure will be run when calling.

Function Type Quantifiers

C syntax enhanced by quantifiers defining where the code is run and from where it may be called:

- __device__ function is run on device (GPU) only and may be called from the device code only
- __global__ function is run on device (GPU) only and may be called from the host (CPU) code only
- __host__ function is run on host only and may be called from the host only
- _host__ and __device__ may be combined function is compiled for both then

The following steps are needed for the full computation:

• allocate memory for vectors and fill it with data

Sample Code

- allocate memory for vectors and fill it with data
- allocate memory on GPU

- allocate memory for vectors and fill it with data
- allocate memory on GPU
- copy vectors a a b to GPU

- allocate memory for vectors and fill it with data
- allocate memory on GPU
- copy vectors a a b to GPU
- compute the sum on GPU

- allocate memory for vectors and fill it with data
- allocate memory on GPU
- copy vectors a a b to GPU
- compute the sum on GPU
- store the result from GPU into c

The following steps are needed for the full computation:

- allocate memory for vectors and fill it with data
- allocate memory on GPU
- copy vectors a a b to GPU
- compute the sum on GPU
- store the result from GPU into c
- use the result in c :-)

When managed memory is used (requires GPU with computing capability 3.0 and CUDA 6.0 or better), steps written in italics are not required.

About The Class

CPU code that fills a and b and computes c

```
#include <stdio.h>
#define N 64
int main(){
 float *a. *b. *c:
 cudaMallocManaged(&a, N*sizeof(*a));
  cudaMallocManaged(&b, N*sizeof(*b));
  cudaMallocManaged(&c, N*sizeof(*c));
 for (int i = 0; i < N; i++) {
   a[i] = i:
   b[i] = i*3:
// GPU code will be here
 for (int i = 0; i < N; i++)
   printf("%f, ", c[i]);
  cudaFree(a); cudaFree(b); cudaFree(c);
 return 0:
```

GPU Memory Management

Using managed memory, CUDA maintains memory transfers between CPU and GPU automatically.

- memory coherency is guaranteed
- GPU memory cannot be used when any GPU kernel is running Memory operations can be programmed explicitly

```
cudaMalloc(void** devPtr, size_t count);
cudaFree(void* devPtr);
cudaMemcpy(void* dst, const void* src, size_t count,
   enum cudaMemcpyKind kind);
```

Running the kernel:

About The Class

- kernel is called as a function; between the name and the arguments, there are triple angle brackets with specification of grid and block size
- we need to know block size and their count
- we will use 1D block and grid with fixed block size
- the size of the grid is determined in a way to compute the whole problem of vector sum

For vector size divisible by 32:

```
#define BLOCK 32
addvec<<<N/BLOCK, BLOCK>>>(a, b, c);
```

How to solve a general vector size?

We will modify the kernel source:

```
__global__ void addvec(float *a, float *b, float *c, int n){
  int i = blockIdx.x*blockDim.x + threadIdx.x;
  if (i < n) c[i] = a[i] + b[i];
}</pre>
```

And call the kernel with sufficient number of threads:

```
addvec<<<N/BLOCK + 1, BLOCK>>>(a, b, c, N);
```

An Example – Running It

Now we just need to compile it :-)

nvcc -o vecadd vecadd.cu

Where to work with CUDA?

- on a remote computer: airacuda.fi.muni.cz, accounts will be made
- your own machine: download and install CUDA toolkit and SDK from developer.nvidia.com
- source code used in lectures will be published as a part of course materials
