About The Class	Motivation	GPU Architecture	C for CUDA	Sample Code
Language				

COVID version of the class

- video presentations
- online consultations

I understand that

- my English is not perfect
- your English may not be perfect
- during consultations, feel free to ask me in Czech/Slovak

About The Class ○●○○○○○○	Motivation 00000000	GPU Architecture	C for CUDA	Sample Code
About the cla	SS			

The class is focused on algorithm design and programming of *general purpose* computing applications on *many-core vector processors*

About The Class ○●○○○○○○	Motivation	GPU Architecture	C for CUDA	Sample Code
About the c	lass			

The class is focused on algorithm design and programming of *general purpose* computing applications on *many-core vector processors*

We will focus to CUDA GPUs first:

- C for CUDA is good for teaching (easy API, a lot of examples available, mature compilers and tools)
- restricted to NVIDIA GPUs and x86 CPUs (with PGI)

About The Class	Motivation	GPU Architecture	C for CUDA	Sample Code
0000000				
About the	class			

The class is focused on algorithm design and programming of *general purpose* computing applications on *many-core vector processors*

We will focus to CUDA GPUs first:

- C for CUDA is good for teaching (easy API, a lot of examples available, mature compilers and tools)
- restricted to NVIDIA GPUs and x86 CPUs (with PGI)

After learning CUDA, we focus to OpenCL

- programming model very similar to CUDA, easy to learn when you already know CUDA
- can be used with various HW devices
- $\bullet\,$ we will focus on code optimizations for x86, Intel MIC (Xeon Phi) and AMD GPUs

The class is practically oriented – besides efficient parallelization, we will focus on writing efficient code.

About The Class ○○●○○○○○	Motivation	GPU Architecture	C for CUDA	Sample Code
What is offer	ed			

You will learn:

- architecture of NVIDIA and AMD GPUs, Xeon Phi
- architecture-aware design of data-parallel algorithms
- programming in C for CUDA and OpenCL
- performance tuning and profiling
- basic tools and libraries for CUDA GPUs
- use cases

About The Class ○○○●○○○○	Motivation	GPU Architecture	C for CUDA	Sample Code
What is exp	ected from	VOU		

During the semester, you will work on a practically oriented project

- important part of your total score in the class
- the same task for everybody, we will compare speed of your implementation
- 50 + 20 points of total score
 - working code: 25 points
 - efficient implementation: 25 points
 - speed of your code relative to your class mates: at most 20 points (only to improve your final grading)

Exam (oral or written, depending on the number of students)

• 50 points

About The Class ○○○●○○○	Motivation	GPU Architecture	C for CUDA	Sample Code
Grading				

For those finishing by exam:

- A: 92–100
- B: 86–91
- C: 78–85
- D: 72–77
- E: 66–71
- F: 0–65 pts

For those finishing by colloquium:

• 50 pts

About The Class	Motivation 00●00000	GPU Architecture	C for CUDA 00000	Sample Code				
Motivation -	Motivation – programming complexity							

OK, GPUs are more powerful, but GPU programming is substantially more difficult, right?

- \bullet well, it is more difficult comparing to writing serial C/C++ code...
- but can we compare it to serial code?

About The Class	Motivation 0000000	GPU Architecture	C for CUDA 00000	Sample Code			
Motivation – programming complexity							

OK, GPUs are more powerful, but GPU programming is substantially more difficult, right?

- \bullet well, it is more difficult comparing to writing serial C/C++ code...
- but can we compare it to serial code?

Moore's Law

Number of transistors on a single chip doubles every 18 months

N.4		- 1 - 1 - 1 - 1 - 1 - 1 - 1 - 1 - 1 - 1		
	0000000			000000000000000000000000000000000000000
About The Class	Motivation	GPU Architecture	C for CUDA	Sample Code

OK, GPUs are more powerful, but GPU programming is substantially more difficult, right?

- \bullet well, it is more difficult comparing to writing serial C/C++ code...
- but can we compare it to serial code?

Moore's Law

Number of transistors on a single chip doubles every 18 months

Corresponding growth of performance comes from

- **in the past:** frequency increase, instruction parallelism, out-of-order instruction processing, caches, etc.
- today: vector instructions, increase in number of cores

0000000	0000000	00000000	00000	00000000000			
Motivation – paradigm change							

Moore's Law consequences:

- in the past:changes were important for compiler developers; application developers didn't need to worry
- **today**: in order to utilize state-of-the-art processors, it is necessary to write parallel and vectorized code
 - it is necessary to find parallelism in the problem being solved, which is a task for a programmer, not for a compiler (at least for now)
 - writing efficient code for modern CPUs is similarly difficult as writing for GPUs

About The Class	Motivation ○○○○●○○○	GPU Architecture	C for CUDA	Sample Code
Electrostatic	Potential N	lap		

Important problem from computational chemistry

- we have a molecule defined by position and charges of its atoms
- the goal is to compute charges at a 3D spatial grid around the molecule
- In a given point of the grid, we have

$$V_i = \sum_j \frac{w_j}{4\pi\epsilon_0 r_{ij}}$$

Where w_j is charge of the *j*-th atom, r_{ij} is Euclidean distance between atom *j* and the grid point *i* and ϵ_0 is vacuum permittivity.

About The Class	Motivation ○○○○○●○○	GPU Architecture	C for CUDA	Sample Code
Electrostatic	Potential M	ар		

Initial implementation

- suppose we know nothing about HW, just know C++ $\,$
- algorithm needs to process 3D grid such that it sums potential of all atoms for each grid point
- we will iterate over atoms in outer loop, as it allows to precompute positions of grid points and minimizes number of accesses into input/output array

About The Class	Motivation	GPU Architecture	C for CUDA	Sample Code
	00000000			
EL CONTRACTO				

Electrostatic Potential Map

```
void coulomb (const sAtom* atoms, const int nAtoms,
    const float gs, const int gSize, float *grid) {
 for (int a = 0; a < nAtoms; a++) {
    sAtom myAtom = atoms[a];
    for (int x = 0; x < gSize; x++) {
      float dx^2 = powf((float)x * gs - myAtom.x, 2.0f);
      for (int y = 0; y < gSize; y++) {
        float dy_2 = powf((float)y * gs - myAtom.y);
        for (int z = 0; z < gSize; z++) {
          float dz = (float)z * gs - myAtom.z;
          float e = myAtom.w / sqrtf(dx2 + dy2 + dz*dz);
          grid[z*gSize*gSize + y*gSize + x] += e;
```

About The Class	Motivation	GPU Architecture ●○○○○○○○	C for CUDA	Sample Code
Why are GPUs so powerful?				

Types of Parallelism

- Task parallelism
 - decomposition of a task into the problems that may be processed in parallel
 - usually more complex tasks performing different actions
 - usually more frequent (and complex) synchronization
 - ideal for small number of high-performance processors
- Data parallelism
 - parallelism on the level of data structures
 - usually the same operations on many items of a data structure
 - finer-grained parallelism allows for simple construction of individual processors

About The Class	Motivation	GPU Architecture	C for CUDA	Sample Code
Why are G	PUs so now	erful?		

From programmer's perspective

- some problems are rather data-parallel, some task-parallel (graph traversal vs. matrix multiplication)
- From hardware perspective
 - processors for data-parallel tasks may be simpler
 - it is possible to achieve higher arithmetic performance with the same size of a processor
 - simpler memory access patterns allow for high-throughput memory designs

About The Class	Motivation	GPU Architecture	C for CUDA	Sample Code
GPU Archited	ture			

DRAM						
CDU						

▲□▶ ▲圖▶ ▲≣▶ ▲≣▶ = = -の��

About The Class	Motivation	GPU Architecture ○○●●○○○○	C for CUDA	Sample Code
GPU Archited	cture			

Main differences compared to CPU

- high parallelism: hundreds thousands threads needed to utilize high-end GPUs
- SIMT model: subsets of threads runs in lock-step mode
- distributed on-chip memory: subsets of threads shares their private memory
- restricted caching capabilities: small cache, often read-only

Algorithms usually need to be redesigned to be efficient on GPU.

About The Class	Motivation	GPU Architecture	C for CUDA	Sample Code
GPU Architecture				

Within the system:

- co-processor with dedicated memory (discrete GPU)
- asynchronous processing of instructions
- attached using PCI-E to the rest of the system (discrete GPU)

About The Class	Motivation	GPU Architecture	C for CUDA	Sample Code
CUDA				

CUDA (Compute Unified Device Architecture)

- architecture for parallel computations developed by NVIDIA
- provides a new programming model, allows efficient implementation of general GPU computations
- may be used in multiple programming languages

About The Class	Motivation	GPU Architecture ○○○○○●○○	C for CUDA	Sample Code
G80 Processo	or			

G80

- the first CUDA processor
- 16 multiprocessors
- each multiprocessor
 - 8 scalar processors
 - 2 units for special functions
 - up to 768 threads
 - HW for thread switching and scheduling
 - threads are grouped into warps by 32
 - SIMT
 - native synchronization within the multiprocessor

About The Class	Motivation	GPU Architecture ○○○○○○○●○	C for CUDA	Sample Code
G80 Memory	Model			

Memory model

- 8192 registers shared among all threads of a multiprocessor
- 16 kB of shared memory
 - local within the multiprocessor
 - as fast as registry (under certain constraints)
- o constant memory
 - cached, read-only
- texture memory
 - cached with 2D locality, read-only
- global memory
 - non cached, read-write
- data transfers between global memory and system memory through PCI-E

Jiří Filipovič Introduction, CUDA Basics

About The Class	Motivation	GPU Architecture	C for CUDA ●○○○○	Sample Code
C for CUDA				

C for CUDA is an extension of C for parallel computations

- \bullet explicit separation of host (CPU) and device (GPU) code
- thread hierarchy
- memory hierarchy
- synchronization mechanisms
- API

About The Class	Motivation	GPU Architecture	C for CUDA ○●○○○	Sample Code
Thread Hiera	rchy			

Thread hierarchy

- threads are organized into blocks
- blocks form a grid
- problem is decomposed into sub-problems that can be run independently in parallel (blocks)
- individual sub-problems are divided into small pieces that can be run cooperatively in parallel (threads)
- all threads from a block run on the same multiprocessor
- scales well

About The Class	Motivation	GPU Architecture	C for CUDA	Sample Code ○○●○○○○○○○		
Thread and Block Identification						

C for CUDA has built-in variables:

- threadIdx.{x, y, z} tells position of a thread in a block
- blockDim.{x, y, z} tells size of the block
- **blockldx**.{**x**, **y**, **z**} tells position of the block in grid (z always equals 1)
- gridDim.{x, y, z} tells grid size (z always equals 1)

- allocate memory for vectors and fill it with data
- allocate memory on GPU
- copy vectors a a b to GPU
- compute the sum on GPU
- store the result from GPU into c
- use the result in c :-)

When managed memory is used (requires GPU with computing capability 3.0 and CUDA 6.0 or better), steps written in italics are not required.

An Example	Sum of	Voctors	
		vectors	

CPU code that fills a and b and computes c

```
#include <stdio.h>
#define N 64
int main(){
  float *a. *b. *c:
  cudaMallocManaged(&a, N*sizeof(*a));
  cudaMallocManaged(&b, N*sizeof(*b));
  cudaMallocManaged(&c, N*sizeof(*c));
  for (int i = 0; i < N; i++) {
    a[i] = i;
   b[i] = i * 3;
  }
// GPU code will be here
  for (int i = 0; i < N; i++)
    printf("%f, ", c[i]);
  cudaFree(a); cudaFree(b); cudaFree(c);
  return 0:
```

同 と く ヨ と く ヨ と …

About The Class	Motivation 00000000	GPU Architecture	C for CUDA	Sample Code
GPU Memory	Manageme	ent		

Using managed memory, CUDA maintains memory transfers between CPU and GPU automatically.

• memory coherency is guaranteed

• GPU memory cannot be used when any GPU kernel is running Memory operations can be programmed explicitly

```
cudaMalloc(void** devPtr, size_t count);
cudaFree(void* devPtr);
cudaMemcpy(void* dst, const void* src, size_t count,
    enum cudaMemcpyKind kind);
```

About The Class	Motivation	GPU Architecture	C for CUDA	Sample Code ○○○○○○○○●○○	
An Example – Sum of Vectors					

Running the kernel:

- kernel is called as a function; between the name and the arguments, there are triple angle brackets with specification of grid and block size
- we need to know block size and their count
- we will use 1D block and grid with fixed block size
- the size of the grid is determined in a way to compute the whole problem of vector sum

For vector size divisible by 32:

```
#define BLOCK 32
addvec<</pre>(a, b, c);
```

How to solve a general vector size?

About The Class	Motivation	GPU Architecture	C for CUDA	Sample Code ○○○○○○○○●○
An Exampl	e – Sum of	Vectors		

We will modify the kernel source:

```
__global__ void addvec(float *a, float *b, float *c, int n){
    int i = blockIdx.x*blockDim.x + threadIdx.x;
    if (i < n) c[i] = a[i] + b[i];
}</pre>
```

And call the kernel with sufficient number of threads:

```
addvec \ll N/BLOCK + 1, BLOCK \gg (a, b, c, N);
```

伺 ト イヨト イヨト
