# Economic, Political and Social Identity in the European Union

**Professor John Wilton** 

Lecture 4

New Institutionalism, Behaviouralism, and an E.U. Identity

- Theory of New Institutionalism and its utility in the construction of an E.U. identity.
- Theory of Behaviouralism and its relationship to the construction of an E.U. identity

- 1. NEW INSTITUTIONALISM
- grew out of greater concentration on attempting to understand the role of institutions in human behaviour - institutions govern the behaviour of men and women, giving rise to determinate results, i.e. policy outputs or social outcomes

- Institutions shape and inform politics, which in turn influences ideological beliefs, values, and social and economic developments
- Institutions provide symbols, rituals and rules so that people can interpret the choices they have and decide between them – choices 'framed' through values.

Three main variants of New Institutionalist theory:

- 1. Historical institutionalism
- 2. Rational choice institutionalism
- 3. Sociological institutionalism

#### Sociological institutionalism

- institutions are crucial mediators, both between the individual and the world at large (society itself) and between different individuals.
- institutions allow individual citizens to make sense of what they, and others, do
  – give us rules, norms, customs and values that shape and influence the pattern of everyday life.

Importance of institutions for outcomes in society derive from *intrinsic* or *extrinsic* aspects:

- the *intrinsic* importance of institutions in their own right – their existence and consequent 'institutional' effect on society in promoting their self-interest, reflecting their self-image;
- or, their *extrinsic* effect the resultant consequences upon society of the operations of institutions

#### **BEHAVIOURALISM**

Talcott Parsons, *The Social System* (1951) – linked the behaviour of individuals and groups in societies to the social system and social structures in societies

all societies constituted a social system, within which operated a number of sub-systems
normal state of any social system was one of *equilibrium* – system always adjusted itself to restore state of *equilibrium*

Talcott Parsons' *structural functionalism* theory:

- *pattern-maintenance function* (managing tension within the system) performed by its cultural sub-system;
- 2. *adaptation or distributive function* performed by the economic sub-system;
- *3. integration function* (co-ordinating interrelationships between members of system) performed by legal and regulatory sub-system;
- **4.** *goal-attainment function* (mobilising people and resources to achieve collective ends) performed by political sub-system

Structural functionalism theory and an E.U. citizen identity?

- E.U. institutions promoting the *patternmaintenance function* to develop an E.U.
   'cultural identity' alongside/complimentary to, national and regional cultures – manage tension between E.U. and national identity?
- 2. Integration function of an E.U. social system assist development of E.U. identity by co-ordinating interrelationships between members of the system through E.U. legal and regulatory sub-system?
