Selected topics in general psychology II.

Lubomír Kostron 2019

The course structure, 2nd part.

- 1. Introduction
- 2. Perception, judgment (and behavioral activities)
- 3. social judgment theory and the nature of information
- 4. A model of personality what is missing?
- 5. The theory o tasks, situations and the environment/ecology
- 6. The role of emotions and group support in the solution of ill defined problems

7. System dynamics - learning to "see" processes 8. The decision-making under uncertainity

9. Interpersonal cognitive conflict solution (workshop with POLICY)

10. The puzzle of Consciousness

11. The aultimate knowledge – the art of asking the smart questions (workshop with "unknown objects")

Students are expected to turn in a paper on one of the issues, listed above. For more detailes see the sylabus.

4. What do we miss so far? Toward a personality model: the "central region" of mind.

The central region structure

Where are the feedback loops?

Experiencing, emotions, motivation

"....It is only with the heart that one can see rightly; what is essential is invisible to the eye". Antoine de Saint-Exupery

"The heart has its reasons of which reason knows nothing". Blaise Pascal. Albert Einstein's letter to his doughter Liserl:

"...there is an extremely powerfull force, for which there is no formal scientific explanation yet. This force includes and rules all the other forces and it is even contained in all the phenomenae operating in the universe, but we did not identify it yet. This universal force is love. When the scientists seeked for an universal unifying theory of the universe, they omited the most powerfull, invisible force. Love is the light which lits those, who give it and those who obtain it. Love is the gravitation, since it causes that some people are being attracted to the other ones"

"... this force explains all and gives a meaning to the life. It is a variable, which we ignored too long time maybe becouse we are scared of it, for love is the only energy in the universe, which we did not learn how to subdue it to our will..."

"... To make love visible, I simply replaced one value in my most famous equation. If we would instead E= mc2 accept, that the energy to cure the world may be obtained through the love times the square of light speed, we would conclude, that love is the strongest force in existence, since it has no limits...."

https://wearelightbeings.wordpress.com/2015/04/15/a-letter-from-albert-einstein-to-his-daughter-about-the-universal-force-which-is-love/

The thinking and feeling; the meaning of experiencing and emotions (an example the organizational structure and culture)

The thinking and feeling; the meaning of experiencing and emotions (an example of the organizational structure and culture)

The transformation of motivation: external x internal motivation The sophistications of organization's processes and the level of self-control

(adapted from Hroník, Galuška, Kopčaj) Level of self-control

How does it all fit together?

Consider the case of

- an individual,
- social setting,
- a civilization

There is a catch, a witchious circle:

in order to determine a tool, which would serve us to understand a person's behavior, we need to understand that person first!

5. The tasks, situations, environments the psychological theory of ecology

The Brunswik 's requirement of representative experimental design (representative samaples of subjects as well as their ecology)

The Hammond's theory of ecology is based on formal characterists of stimulae/cues/information, which the ecology presents (any classification based upon the "content" is not realistic).

The cues/incoming information induces either more analytical processes, or intuition: the "quasirational thinking" consists of a mixture of both (see picture 16).

Which exceptional situations/tasks induce usualy rational thinking or intuition?

The personality and the environment problem

- There are many psychological theories of personality;
- Psychological theories of the environments/situations are rare;
- The perception of a situation is influenced by its meaning for a given person. However, the understanding of the meaning may be influenced by an understanding of a much wider framework/context (for instance - history).

The typology of intelectual tasks by John Rohrbaugh, S.U.N.Y. at Albany, Rockefeller College of Public Affairs and Policy http://grantome.com/grant/NSF/IIA-9014357

differentiation

integration

Negotiation, common goals

More parties, many criteria, different interests. Agreement negotiations. The conflict of interests.

analysis (criteria previously agreed upon)

Few possibilities of a solution; total co-operation is important; the cognitive conflict.

Exploration, problem solving

New information seeking

More solutions possible with outcomes, which may be divided; a co-operation is not necessary; creative generation of ideas.

The making of strategies and planing.

Assessment, decision - making

intuition (usual

solution possibilities)

The situational - experiencing space

(a metaphore: the linear and curvilinear spacetime)

6. The role of emotions (and group support) in solving ill defined problems solution.

Bill Critchley, organizational consultant

Dave Casey - Director at Fire and Emergency Training Institute/ Louisiana State University (perhaps not a picture of the right person...? But he look good.)

Bill Critchley, David Casey : tasks, emotions, work - building of a team

Figure 35.2 Different modes of working require different methods

7. System dynamics - learning to see... What connects perception, thinking memory and learning? The beginning of knowledge is:

- bringing "static order" into chaos,
- recognizing change, processes, systems
- a single loop learning adaptation
- a double loop generative learning

a) The static view of the world: Classification, bringing order/system into chaos.

Some notable examples:

Carl von Linné or Carolus Linnaeus, 1707 – 1778 is often called the Father of Taxonomy. Classification of plant and animals.

What are the classification kriteria?

Dimitirij Ivanovič Mendelejev 8.2.1834 – 2.2.1907

What is the organizing principle?

			_	Periodic Table														2 He
2	3 Li	4 Be		of the Elements									s B	°C	7 N	8 0	9 F	10 Ne
3	11 Na	12 Mg	IIIB	IVB	٧B	VIB	VIIB				IB	IB	13 Al	¹⁴ Si	15 P	16 S	17 CI	18 Ar

Abraham Harold Maslow's hierarchy of needs

1.4.1908 Brooklyn – 8.6.1970 Menlo Park

Co-founders of the general systems theory :

Living systems are open systems, characterized by:

- complexity,
- seeking of a dynamic equilibrium,
- use feedback loops and,
- temporarily defy entropy by selforganization.

Kenneth Ewart Boulding 18.1.1910 – 18.3.2000

Ludwig von Bertalanffy 19.9.1901 Vienna – 12.6.1972 Buffalo, N.Y.

Humberto R. Maturana 14.9.1928

A concept of an, autopoietic (self-developing) system", a separeate system, staying as a structure, which behavior is governed by it. Used alo in socials ciences. The nervous system is coupled to the organism that it integrates in a manner that its plastic connectivity is being continuously determined though its participation in the autopoiesis of the oprganism.

Therefore, the connectivity of the nervous system is coupled to the history of interactions od the organism to which it is coupled.

Humberto Maturana, Cognitive strategies

THE TREE OF KNOWLEDGE

The Biological Roots of Human Understanding Revised Edition

Humberto R. Maturana, Ph.D & Francisco J. Varela, Ph.D Foreword By I.Z. Young

Science is not a domain of objective knowledge, but a domain of subject dependent knowledge defined by a methodology that specifies the properties of the knower.

When top level guys look down they see only shit.

When bottom level guys look up they see only assholes.

Two examples of a static systems view in the theory of organization

The transformation of static picture into a dynamic moving pictures. An event is always only a part of a story

The cognitive development view

When you teach a child something, you take away forever his chance of discovering it for himself. J.P.

Jean Piaget 1896 Neuchatel - 1980 Geneva

Sensorimotor	Birth - 2 years	-Identifies object permanence: the object still exists when out of sight -Recognition of ability to control objects and acts intentionally
Preoperational	2 - 7 years	-Begins to use language -Egocentric thinking: difficulty seeing things from other viewpoints -Classifies objects by single feature: example- color
Concrete Operational	7 - 11 years	-Logical thinking -Recognizes conservation of numbers, mass and weight -Classifies objects by several features and can place them in order
Formal Operational	11 years and up	-Logical thinking about abstract propositions -Concerned with the hypothetical and the future -Create hypotheses and test

Picturing change over time – evolution, development. Linear and non-linear view (see also slides 49 – 54)

Decision - making and its consequences

time

By Jay W.Forrester

b) A way to a more advanced thinking: the system dynamics

Peter M.Senge 1947 Stanford: System dynamics thinking – "The learning organization" Jay Wright Forrester 14.7.1918 – 16.11.2016 founder of S.D., "The world dynamics" John Sterman : system dynamics modelling – "The Business Dynamics"

All at the Sloan School of management, M.I.T., Boston

An example of a dynamic structure, consisting of feedback loop processes: a price inflation model

signifies positive feedback relations where more leads to more and less leads to less

signifies negative feedback relations where changes in one direction are associated with changes in the opposite direction.

An example: how to turn the SWOT table into a set of processes, which hide the root cause of a problem

Single-loop learning rests in an ability to detect and correct error in relation to a given set of operating norms:

Double-loop learning depends on being able to take a "double look" at the situation by questioning the relevance of operating norms:

Cattle graze off shamrocks

Cattle turns into a canned meat for sailors

Performing: Access Downloading achieve results through Your practices, infrastructures patterns of the past Open embodying suspending Mind Prototyping: Seeing co-create strategic microcosms with fresh eyes Open deep dive enacting Heart Crystallizing Sensing vision and intention from the field Open letting-go Will letting-come Presencing connecting to Source Who is my Self? 8. Decision-making under uncertainty:

Dimensions of uncertainity – *the object, the ecology/situation* and *the decision-maker*

Uncertainty occurs when, given current knowledge, there are multiple possible states of nature.

S.U.N.Y. at Albany Rockefeller College of Public Affairs and Policy

A MACAT ANALYSIS

AMOS TVERSKY AND DANIEL KAHNEMAN'S

JUDGMENT UNDER UNCERTAINTY HEURISTICS AND BLASES

Judgment in managerial decison making

- System 1 intuitive, fast, automatic, effortless, implicit and emotional
- System 2 conscious, slow, effortful, explicit and logical

Bateman, 2009

Kahneman & Tversky

Proposed 3 main ideas:

- 1. People rely on heuristics to make social inferences
- 2. Heuristics simplify the process of making social inferences
- 3. Heuristics sometimes lead to faulty reasoning

Daniel Kahneman, psychologist, 2002 Nobel Price in Economics

Tom Steward's slides: Probability is the most widely used measure of uncertainty

• Relative frequency

- The probability of an event is the frequency of it's occurrence divided by the number of experiments, or trials (for a very large number of trials).
- Subjective probability (Bayesian)
 - The probability of an event is the degree of belief that a person has that it will occur.

Morgan, M. G., & Henrion, M. (1990). *Uncertainty: A Guide to Dealing with Uncertainty in Quantitative Risk and Policy Analysis*. New York: Cambridge University Press.

Types of Uncertainty

- Uncertainty 1 States (events) and probabilities of those events are known
 - Coin toss
 - Die toss

Precipitation forecasting (approximately)

Note: This is sometimes called <u>aleatory</u> uncertainty. It reflects the nature of random processes. For example, even though you know a fair die has six sides, you cannot reduce the uncertainty about what the next roll will show. But you can quantify the uncertainty. For the simple case of the die, the odds are 1 in 6 of any particular face turning up.

Types of Uncertainty

- Uncertainty 2 States (events) are known, probabilities are unknown
 - Elections
 - Stock market
 - Forecasting severe weather

Types of Uncertainty

- Uncertainty 3 States (events) and probabilities are unknown
 - Y2K
 - Global climate change
- The differences among the types of uncertainty are a matter of degree.

Epistemic Uncertainty

Uncertainty 2 and 3 include <u>epistemic</u> uncertainty. This is uncertainty due to incomplete knowledge of processes that influence events. Incomplete knowledge results from the sheer complexity of the world, particularly with respect to issues at the interface of science and society. As a result, models (computer or mental) necessarily omit factors that may prove to be important. It is possible to judge the relative level of epistemic uncertainty, i.e., because of the time frames and number of potentially confounding factors, it is higher in nuclear waste disposal and climate prediction than in the prediction of weather and asteroid impacts. Total uncertainty is the sum of epistemic and aleatory uncertainty.

(see Brunswik)

Picturing uncertainty

• There are many ways to depict uncertainty. For example,

Comtinuous events: scatterplot

Any taxonomy – For instance see slide 28

Continuous Judgments and Events

- Consider the case of a continuous judgment about a continuous event. Examples:
 - Weather forecasts of windspeed, temperature
 - Economic forecasts of unemployment, inflation
 - Medical diagnosis of severity of disease
 - Judgment of suitability of a job applicant
 - Judgment of quality of college applicant
 - Judgment of need for admission to hospital

Scatterplot: Correlation = .50

Scatterplot: Correlation = .20

Scatterplot: Correlation = .80

Scatterplot: Correlation = 1.00

The perfect judgment

Uncertainty, Judgment, Decision, Error

- Taylor-Russell diagram
 - Decision cutoff
 - Criterion cutoff (linked to base rate)
 - Correlation (uncertainty)
 - Errors
 - False positives (false alarms)
 - False negatives (misses)

Taylor-Russell diagram

Tradeoff between false positives and false negatives

Problem: Optimal decision cutoff

- Given that it is not possible to eliminate both false positives and false negatives, what decision cutoff gives the best compromise?
 - Depends on values
 - Depends on uncertainty
 - Depends on base rate

• Decision analysis is one optimization method.

Example: Weather forecaster's decision to warn the public about an approaching storm

Decision tree

The trouble is to create the hierarchies of problems to be solved according to their urgency in a constant flow of situations, presenting us with new tasks. What to deal with and what to forget.

What are the desired consequences of decisions (goals) and what is the possible array unexpected consequences?

Problem solving of well or poor structured tasks returns us back to the cognitive continuum theory.

10. The most difficult and ages old puzzles of self-awareness and consciousness:

- exactly, what are they?
- Where do they come from?
- How did they evolve?
- too difficult just for psychologists:

Philosophers, shamans, clergyman, physicians, intellectuals, esotheric seers, psychologists, physicists, neurologists neuronal nets folks, artificial intelligence, artificial life folks

Simple Definition of consciousness

* the condition of being conscious : the normal state of being awake and able to understand what is happening around you

* a person's mind and thoughts

* knowledge that is shared by a group of people

Source: Merriam-Webster's Learner's Dictionary

Full Definition of consciousness

1 a : the quality or state of being aware especially of something within oneself

b: the state or fact of being conscious of an external object, state, or fact

c : awareness; especially : concern for some social or political cause

- 2 : the state of being characterized by sensation, emotion, volition, and thought : mind
- **3** : the totality of conscious states of an individual
- 4 : the normal state of conscious life <regained consciousness>

5 : the upper level of mental life of which the person is aware as contrasted with unconscious processes

Some examples:

Daniel C.Dennet, multidisciplinary approach

DANIEL C. DENNETT Author of Brainstorms and granthan of The Mind's I " Grof tries to disproof materialistic world view. He claims, that the interpersonal reality is equally real, as our usual reality, if not even more so. The criticism of his scientific and artistic legacy (see The Sisyfos Club – Grof "breaks the bonds of spacetime and thus he can get into anyhing at any time") is right in a sense, that the proof of consciouness primacy over matter is hard to defend – it assumes the a priory "absolute consciousness", or "the pregnant void". I guess that this issue is primarily a matter of belief. The western science was never able to clarify the mind – matter relation".

Pablo Kral

Psychiatrits Stanislav Grof (1931), transpersonal psychology

David Chalmers philosopher

Antonio Damasio neurologist

ANTONIO DAMASIO The FEELING of WHAT HAPPENS

BODY AND EMOTION IN THE MAKING OF CONSCIOUSNESS

-ter are there when a terms of the second -

Quantum physics theory of consicousness mind. Microtubules and quantum consciousness.

Sir Roger Penrose Mathematics, physicist

Stuart Hameroff anesthesiologist

The soul does not die , but returns to the universe

Stuart Hameroff and sir Roger Penrose claim, that human brain is a biological computer and our consciousness is a software, which runs there. This program does not cease to exist even after our death. The soul exists in the structures of filamentous brain cells called microtubules. When people enter the stage of clinical death, their microtubulae loose their quantum state, but the information contained there changes into a wave state and stays preserved. Quantum information can not be destroyed, it can only disseminate into a larger space.

Thus our soul is rather as program and our consciousness is a result of "quantum gravitation" processes within the microtubular structures ("orchestrated objective reductions" – Orch-OR).

http://www.quantumconsciousness.org/

What magical trick makes us intelligent? The trick is that there is no trick. The power of intelligence stems from our vast diversity, not from any single, perfect principle.

(Marvin Minsky)
