

Environmental aspects of nuclear energy

**PhDr. Tomáš Vlček, Ph.D.
(Ing. Jiří Martinec, Ph.D.)**

Environmental aspects of energy

Environmental aspects assesment

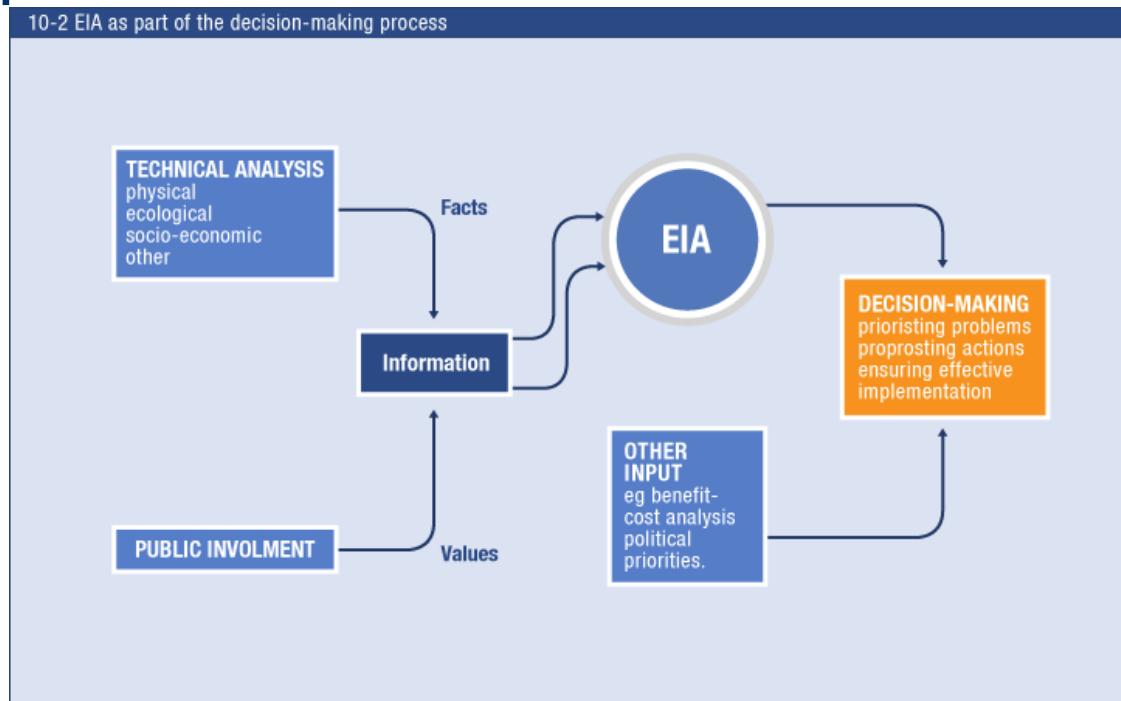

Over the next five minutes each of you write pros and cons of nuclear energy in terms of national energy security.

Environmental aspects assesment

Over the next five minutes each of you write pros and cons of nuclear energy in terms of purely subjective, personnal point of view.

Environmental aspects assesment

To bridge the conflict between state and industry interests and personal subjective perception of the problem serves the EIA.

Environmental aspects assessment

What is an *environmental aspect* ?

According to ČSN EN ISO 14001 definition:

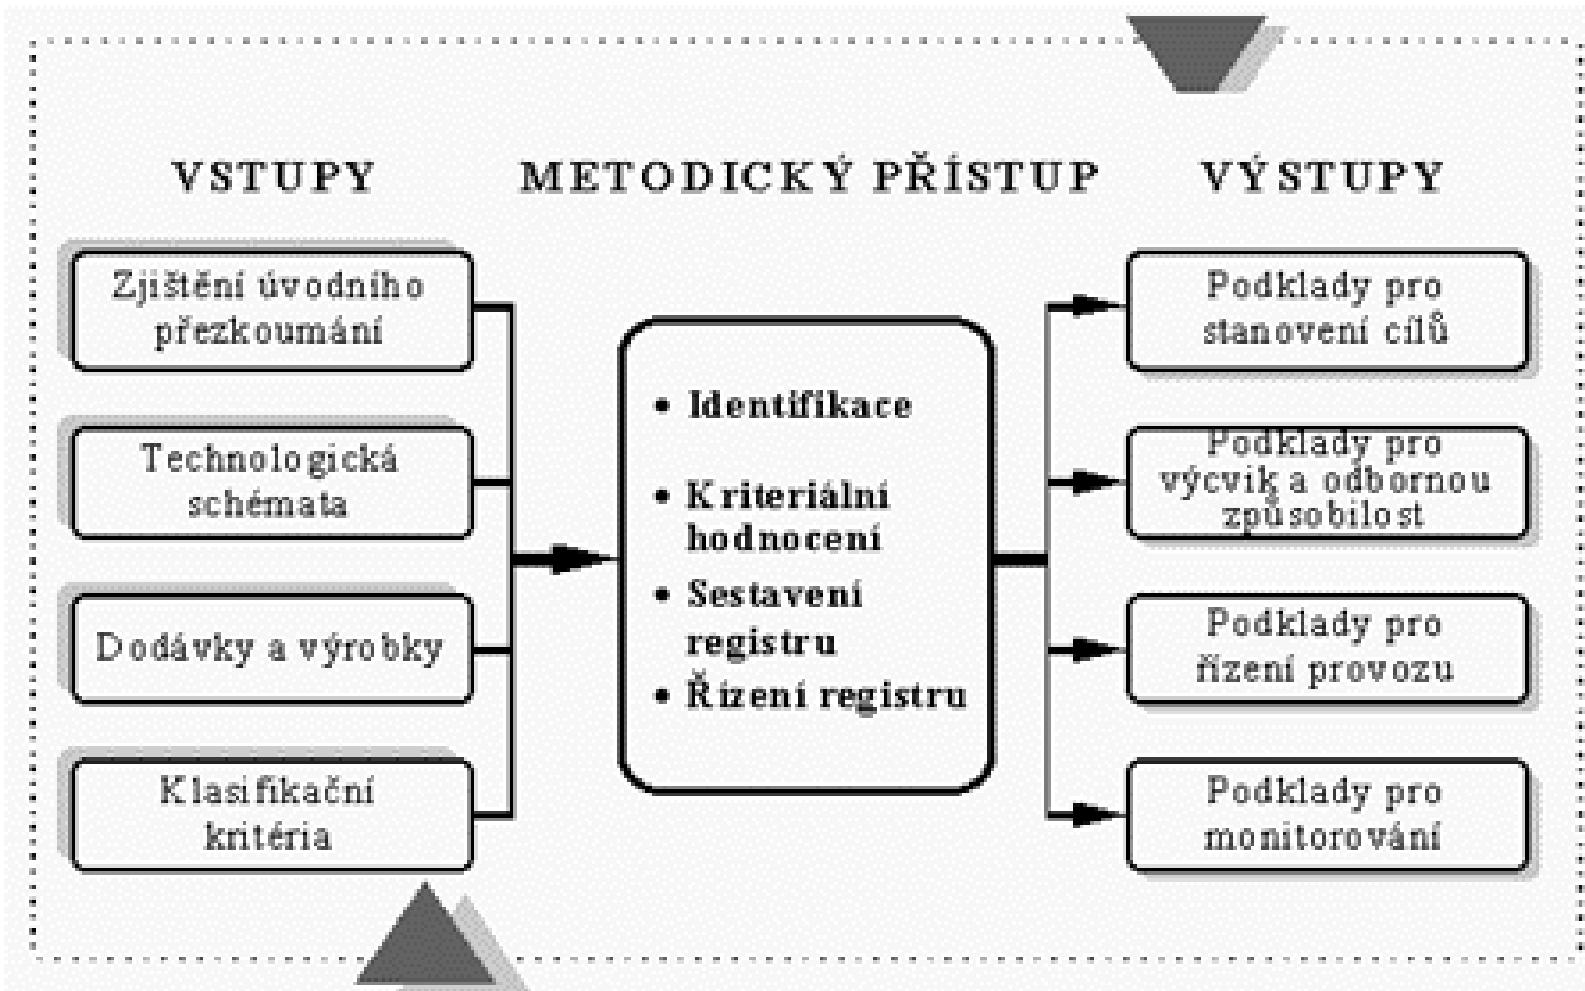

„The environmental aspect is an element of the activities, products or services that can interact with the environment.“

Environmental aspects assessment

ISO 14001 (voluntary norm of the International Organization for Standardization on environmental management, prestige of the company, the norm requires to have an **environmental policy and environmental risk assessment**)

EMAS (Environmental management and audit system developed by EC in 1993, it requires ISO 14001 and other requirements such as the involvement of employees, etc., EMAS is thus perceived as a **premium tool** for environmental management. As part of this process so called **Environmental review** takes place - own risk identification, preparation of environmental policy, determining environmental aspects, objectives, programs)

Environmental aspects assesment

Environmental aspects assesment

Tabulka registru aspektů a dopadů – část A – přímé

VEA – významný environmentální aspekt, NEA – nevýznamný environmentální aspekt, H - stav havarijní , B –běžný provoz, M – mimořádný stav S - součet

Poř. číslo	Místo vzniku (pracoviště, proces)	Činnost	Aspekt	Dopad	Provoz B/M/H	Významnost	L	D	P	S	Opatření,odpovědnost (měření, cíl atd.)
1	Ředitelství ZZS OK	administrativa	vznik sběrového papíru	čerpání přírodních zdrojů	B	NEA	1	1	1	3	optimalizace spotřeby papíru v administrativě
			spotřeba el. energie	čerpání přírodních zdrojů	B	NEA	1	1	1	3	nesvítit zbytečně, el. energii odebírat co nejrovnoměrněji
			spotřeba pitné vody	čerpání přírodních zdrojů	B	NEA	1	1	1	3	kontrolovat vypnutí kohoutků, neplytvit pitnou vodou
			vznik odpadních splaškových vod	zátěž přírody v podobě odpadních vod	B	NEA	1	2	1	4	neznečišťovat splaškové vody závadnými látkami
			spotřeba zářivek	vznik nebezpečného odpadu	B	VEA	1	2	2	5	nesvítit zbytečně, zářivky opakováně nezapínat a nevypínat EMS 1/2013
			spotřeba tonerů	vznik nebezpečného odpadu	B	VEA	1	2	2	5	maximální šetření při tisku dokumentů, zpětný odběr zajistěn smluvně
			vznik komunálního i ostatního odpadu	zátěž přírody v podobě ukládání odpadů	B	NEA	1	1	1	3	maximální množství obalů vracet k recyklaci, třídit odpady

Environmental aspects assessment

Methodology for assessing the environmental aspects

Assessment of the EA is performed using following 4 criteria.

Criteria:

- compliance with the limits and mandatory requirements
- frequency impact
- impact associated with the effects on the environment (size, persistence, scale)
- impact on society (its economy and image)

Environmental aspects assesment

klasifikace (K)		1 bod problém není nebo je malý	2 body existuje problém	3 body existuje zásadní problém
kritérium č.	váha kritéria (V)			
1.	3	limity a zákony jsou plněny nebo limity a zákony nejsou stanoveny	limity a zákony nejsou občas plněny nebo jejich plnění je na hranici limitu	limity a zákony nejsou plněny nebo jsou často překračovány
2.	2	výskyt dopadu je minimální a/nebo dopadu lze zabránit	výskyt dopadu je častý a/nebo dopadu lze částečně zabránit	výskyt dopadu je vysoký a/nebo dopadu nelze zabránit
3.	2	dopad se dá odstranit a/nebo ovlivnění ŽP je minimální a není trvalé a/nebo ovlivnění ŽP je v lokálním měřítku	dopad se dá částečně odstranit a/nebo ovlivnění ŽP je velké ale není trvalé a/nebo ovlivnění ŽP je v regionálním měřítku	dopad se nedá odstranit a/nebo ovlivnění ŽP je trvalé a/nebo ovlivnění ŽP je v globálním měřítku
4.	1	EA nemá vliv na společnost (neohrožuje ani nezatěžuje její ekonomiku) a/nebo není příčinou stížností a/nebo dopad EA není viditelný	EA má vliv na společnost (zatěžuje její ekonomiku) a/nebo ojediněle je příčinou stížností a/nebo dopad je viditelný	EA má významný vliv na společnost (významně zatěžuje její ekonomiku) a/nebo v minulosti byly stížnosti a/nebo v lokalitě má společnost špatné jméno

Environmental aspects assesment

Important EA	Over value less equals or higher then 15 (and all rated 3 in criterium 1)
Not important EA	Over value less than 15

EIA (Environmetal Impact Assessment, all projects that could have a negative impact on public health, flora, fauna, ecosystems, soil, air, but also on cultural heritage, natural resources or assets, are within the scope of the assessment according to the law - a list of projects is given in Annex Law)

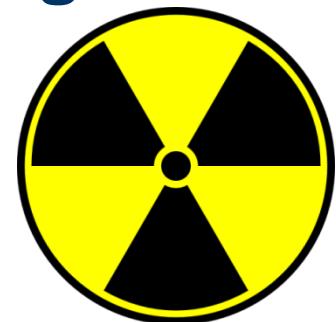

Environmental aspects assesment

The process is:

- announcement to the authorities (Region, ME)
- official publication/announcement by the competent authorities
- 20-day deadline for comments
- screening procedure
- documentation
- preparing the report (90 days)
- Comments (30 days)
- the final opinion as a professional basis for related procedures (eg. land, construction) valid for 5 years and with the possibility of extension

Nuclear energy in general

- **production of fissile materials**
- production of electricity in nuclear power plants
- release of nuclear energy from the atomic nucleus
- chain fission in nuclear fuel
- accompanying phenomenon - **ionizing radiation**

Production of fissile materials

Mining in the open pit mines:

- extraction in open pit mines very similar to coal production
- generally the least impact on the environment with respect to other methods of mining
- extraction of nuclear fuel is just as harmful as other methods of mining
- intervention in the landscape depends on the amount of ore and yield (percentage of) nuclear fuel

Rössing, Namibia

Brown coal production – chateau Jezeří

Uranium production – Rožná

Production of fissile materials

Chemical processing of mined ore (Mydlovary MAPE, 20 km from ETE):

- leaching with sodium bicarbonate (higher content of carbonates) or sulfuric acid (reduced content of carbonates)
- ratio of sulfuric acid up to 560 g of 94% acid per one liter of the leached material
- processed 16.7 mil. tonnes of ore, formation of tailing ponds with a total area of 300 ha - 36 mil. tonnes of sludge
- heavy metals and radioactive substances

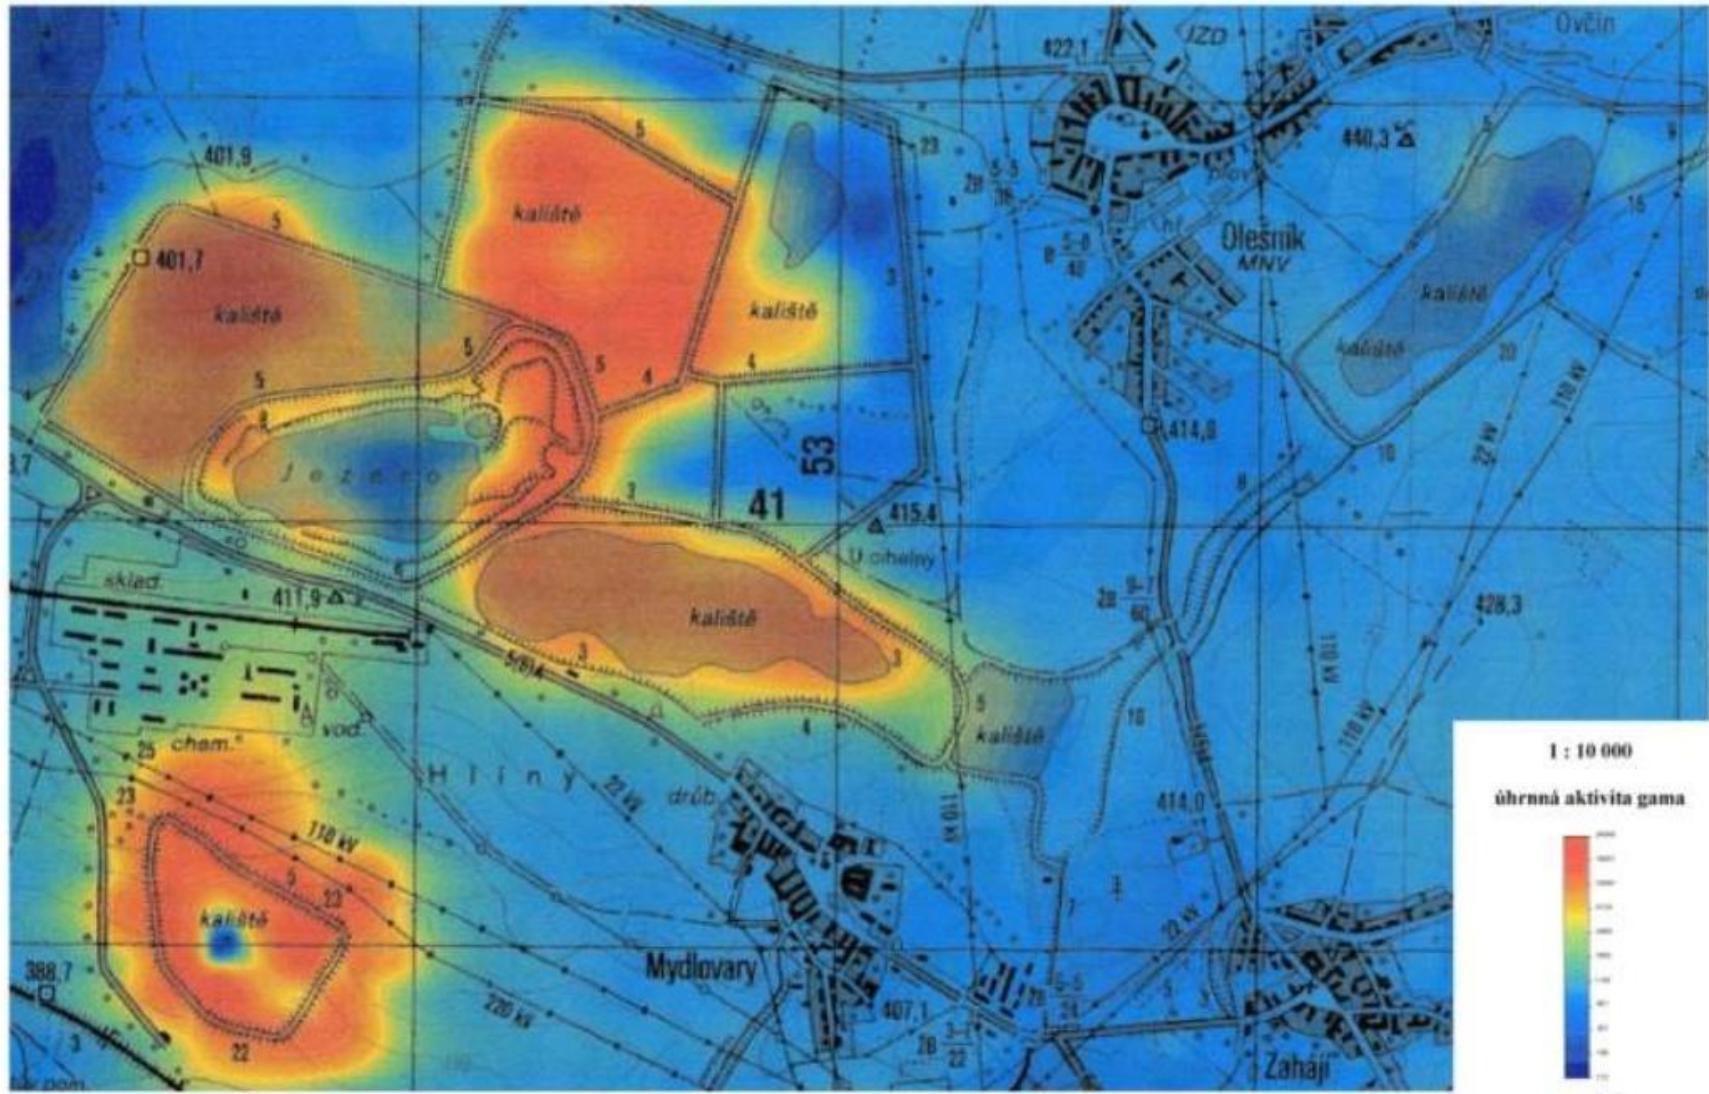

Production of fissile materials

Radiokontaminace půd a sedimentů:

Uran, alfa záříče, radon apod.

Production of fissile materials

Production of fissile materials

Underground mine in Straz pod Ralskem

- 1966-1970 first attempts introducing methods of chemical leaching
- until the early 90s leaching fields with a total area of 7 km²
- during the entire period of the chemical extraction of underground injected more than 4 mil. tons of sulfuric acid

Production of fissile materials

Underground mine in Straz pod Ralskem

- contamination has spread to an area covering about 27 km²
- affected 370 mil. m³ of groundwater
- currently the contamination in an amount of 4.9 mil. t of solutes
- beginning of restoration

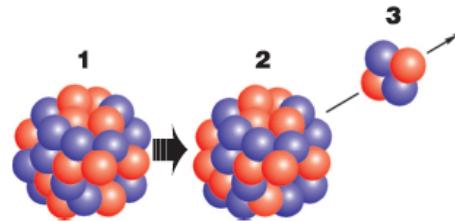

Restoration – Stráž pod Ralskem (DIAMO)

- restate geological environment to the state that will ensure exploitation of drinking water in the region
- dispose of wells and surface facilities
- incorporate the surface of extracted fields in ecosystems with regard to regional systems of ecological stability
- several stages of redevelopment, estimated cost of 40 billion CZK

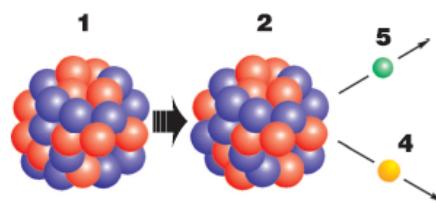

Radioactivity

- radioactivity (or radioactive decay) is the spontaneous transformation of nuclei unstable nuclides other cores
- at the same time it generates ionizing radiation
- natural or artificial radioactivity
- transmutation
- decay of nuclei by decay series and the established principles

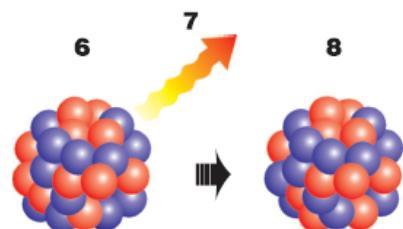

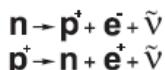

Radioactivity

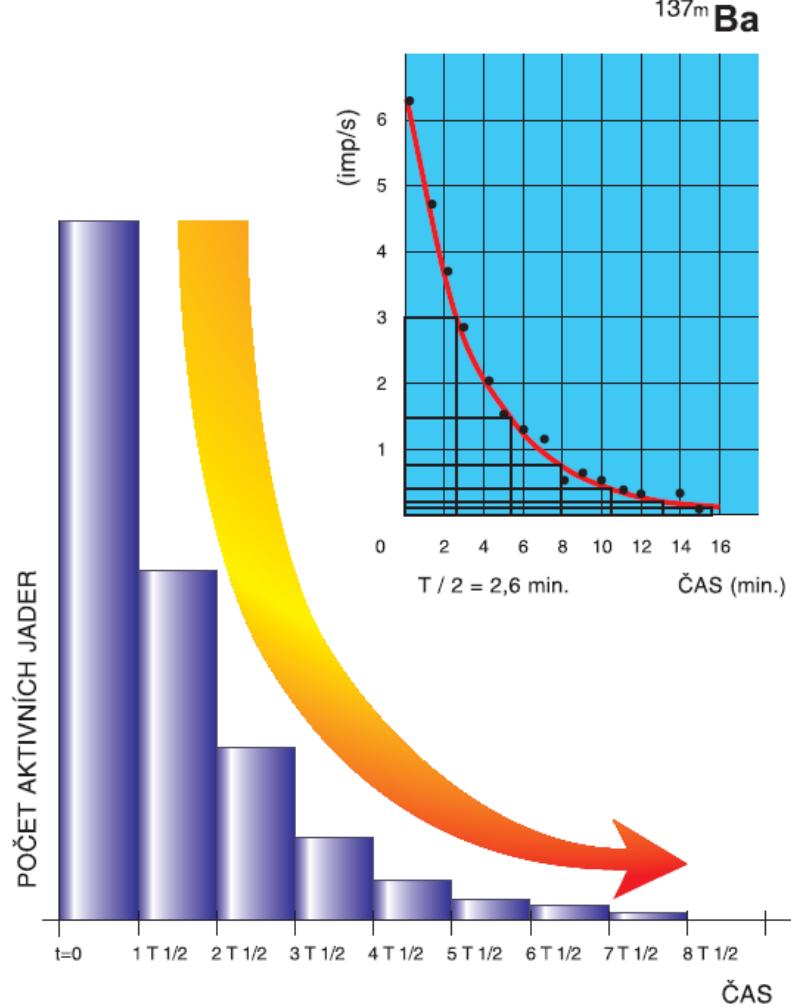

PŘEMĚNA ALFA

PŘEMĚNA BETA

PŘEMĚNA GAMMA

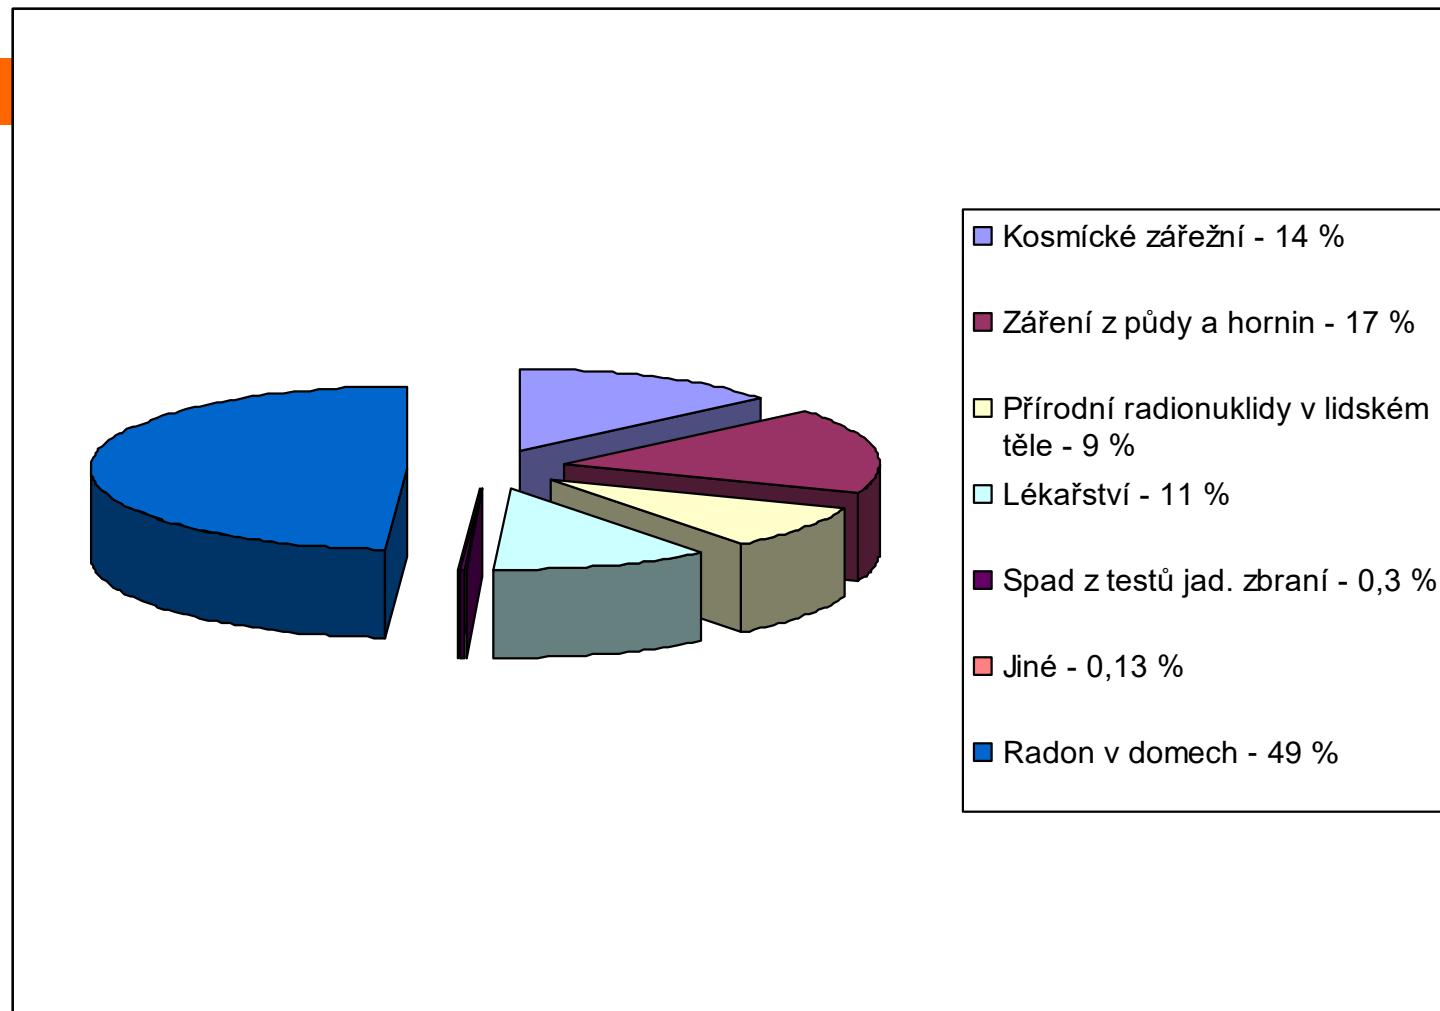

1. MATEŘSKÉ JÁDRO
2. DCEŘINÉ JÁDRO
3. α ČÁSTICE
4. ELEKTRON (β^-)
5. ANTINEUTRINO ($\bar{\nu}$)
6. EXCITOVAÑE JÁDRO
7. γ ZÁŘENÍ (fotony)
8. STABILIZOVANÉ JÁDRO

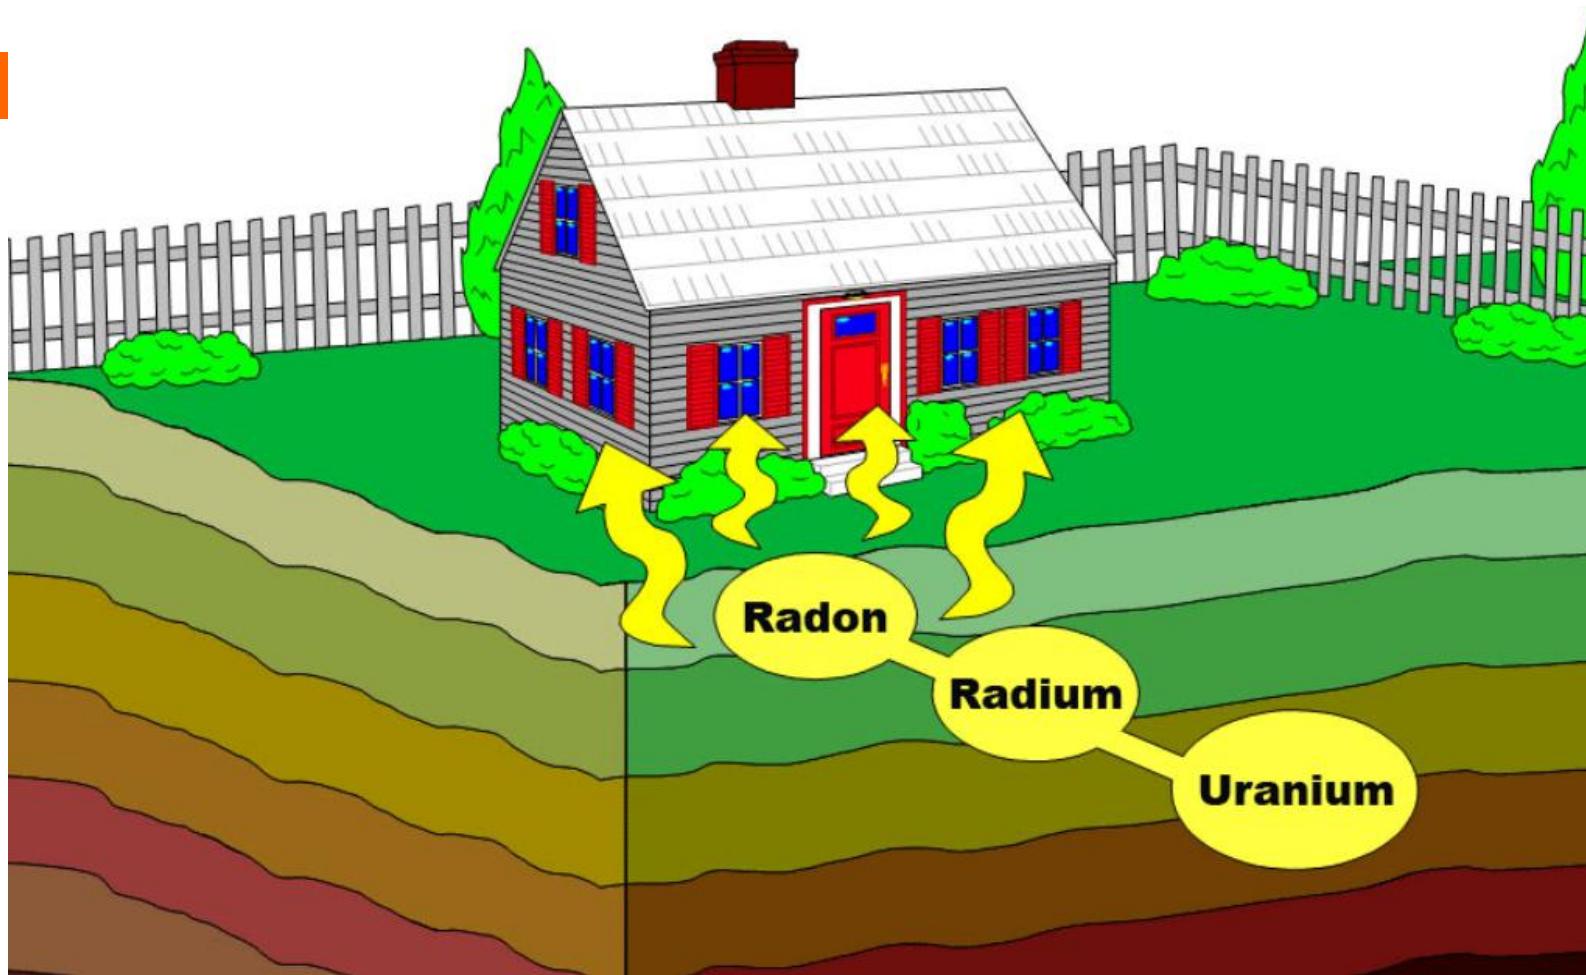

Radioactivity

- **cosmogenic radionuclides**: tritium ${}^3\text{H}$ (half-life 12,5 years), carbon ${}^{14}\text{C}$ (half-life 5730 years)
- **Primary radionuclides** : potassium ${}^{40}\text{K}$ (half-life $1,26 \times 10^9$ years), thorium ${}^{232}\text{Th}$ (half-life $1,4 \times 10^{10}$ years), uranium ${}^{238}\text{U}$ (half-life $4,5 \times 10^9$ years), ${}^{235}\text{U}$ (7×10^8 years)
- **Secondary radionuclides**: radionuclides of decay series – thorium, uranium, aktinouranium, neptunim

Sources of radiation

Radon

Nuclear energy safety and environmental aspects

- the use of nuclear energy is regulated by law
- Nuclear safety is not a mere formality, it is an enforceable requirement
- All effects are monitored and evaluated
- responsibility is transferred to the operator's license holder

Nuclear safety – deep protection

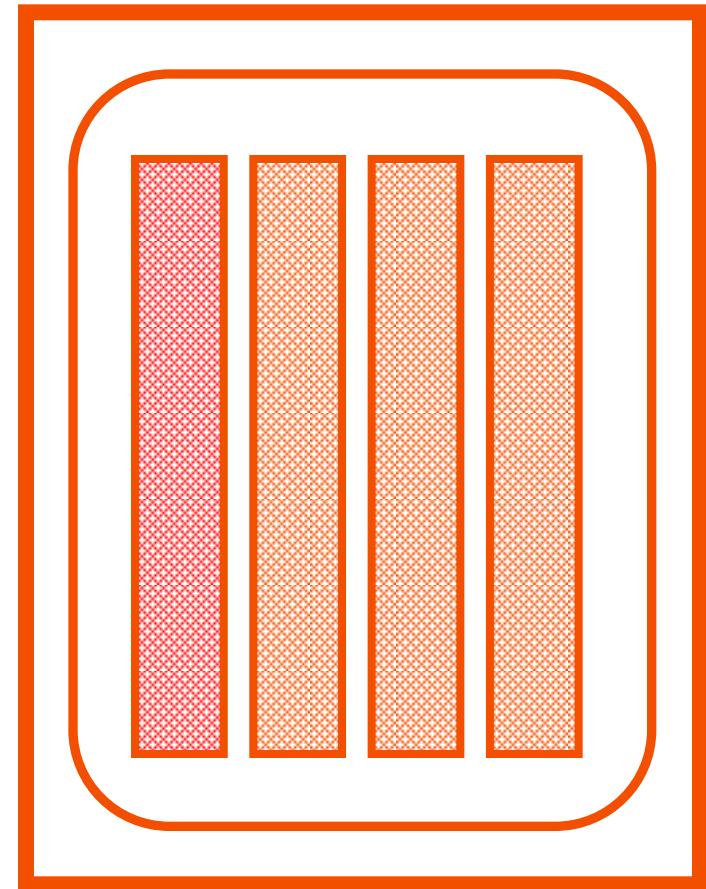

Deep protection = means to achieve the basic objective of safety

First barrier: **molecular matrix fuel** (almost all the fission products resulting from fission are captured in the matrix of the uranium tablets)

Second barrier: **hermetic fuel cladding** (an alloy of zirconium-niobium)

Third barrier: **the primary circuit pressure limit** (resistant to high pressure, temperature, radiation and radiation dynamic conditions of operation)

Fourth barrier: **hermetic borders of rooms - containment** (building design protection, resists airplane crash, blast wave, explosion, storm, extreme temperatures, extreme precipitation, etc.)

Operation of nuclear power plant

- nuclear fission
- necessary operating conditions
- waste production
- disposal of spent nuclear fuel

All the above can be part of the process or source of ionizing radiation.

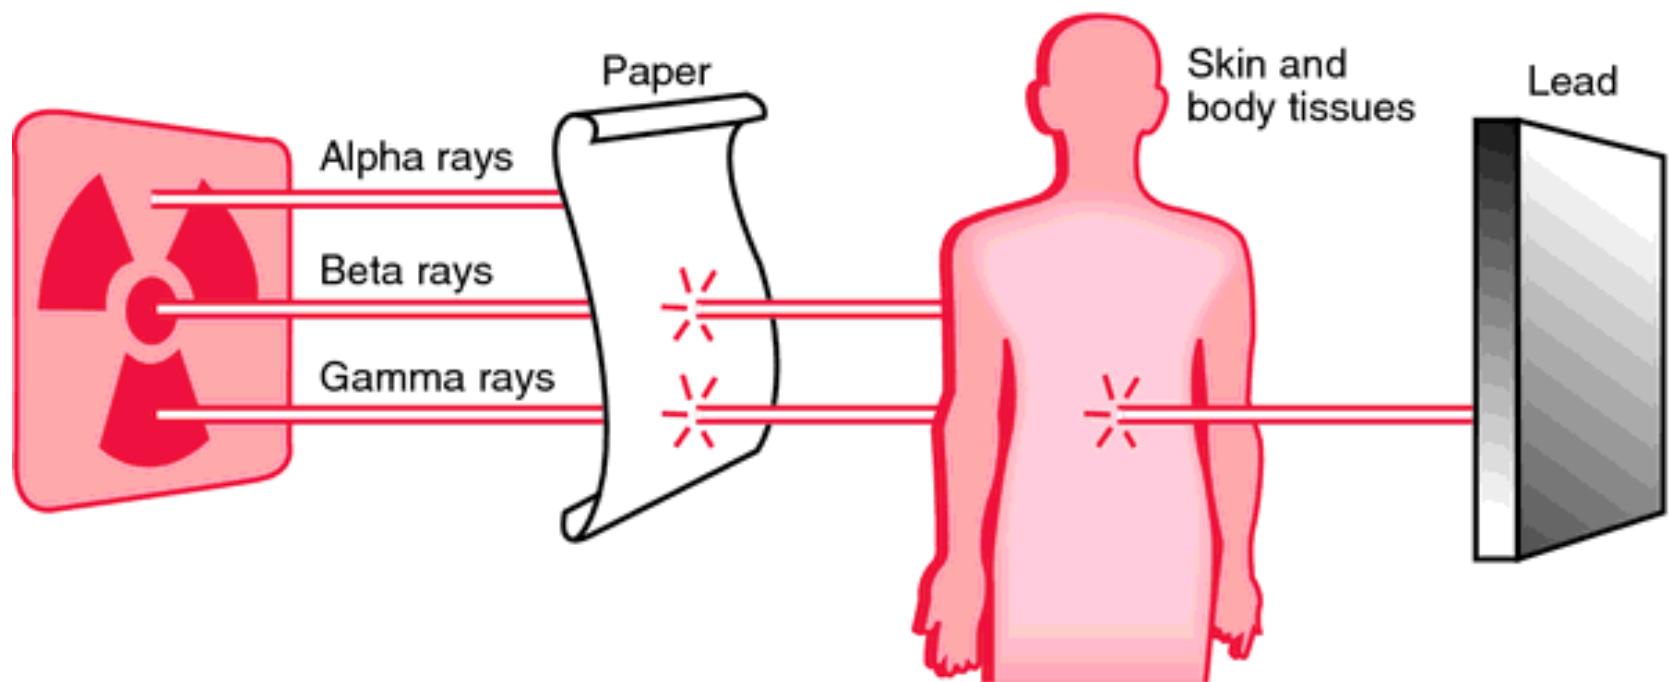

Protection against radiation

Distance - ionizing radiation intensity decreases with the square of the distance, ie. after 10 m it is 100 times lower, after 100 m it is 10000 times lower, after 1 km it is a million times lower.

Time - the shorter the exposure, the smaller the cumulative dose

Shielding - depending on the type of radiation: alpha radiation skin tones, clothing, paper; beta radiation, aluminum sheet; gamma rays concrete, a layer of water, soil; neutron radiation, water, polystyrene, paraffin.

Protection against radiation

Protection against radiation

Objective of the radiation protection

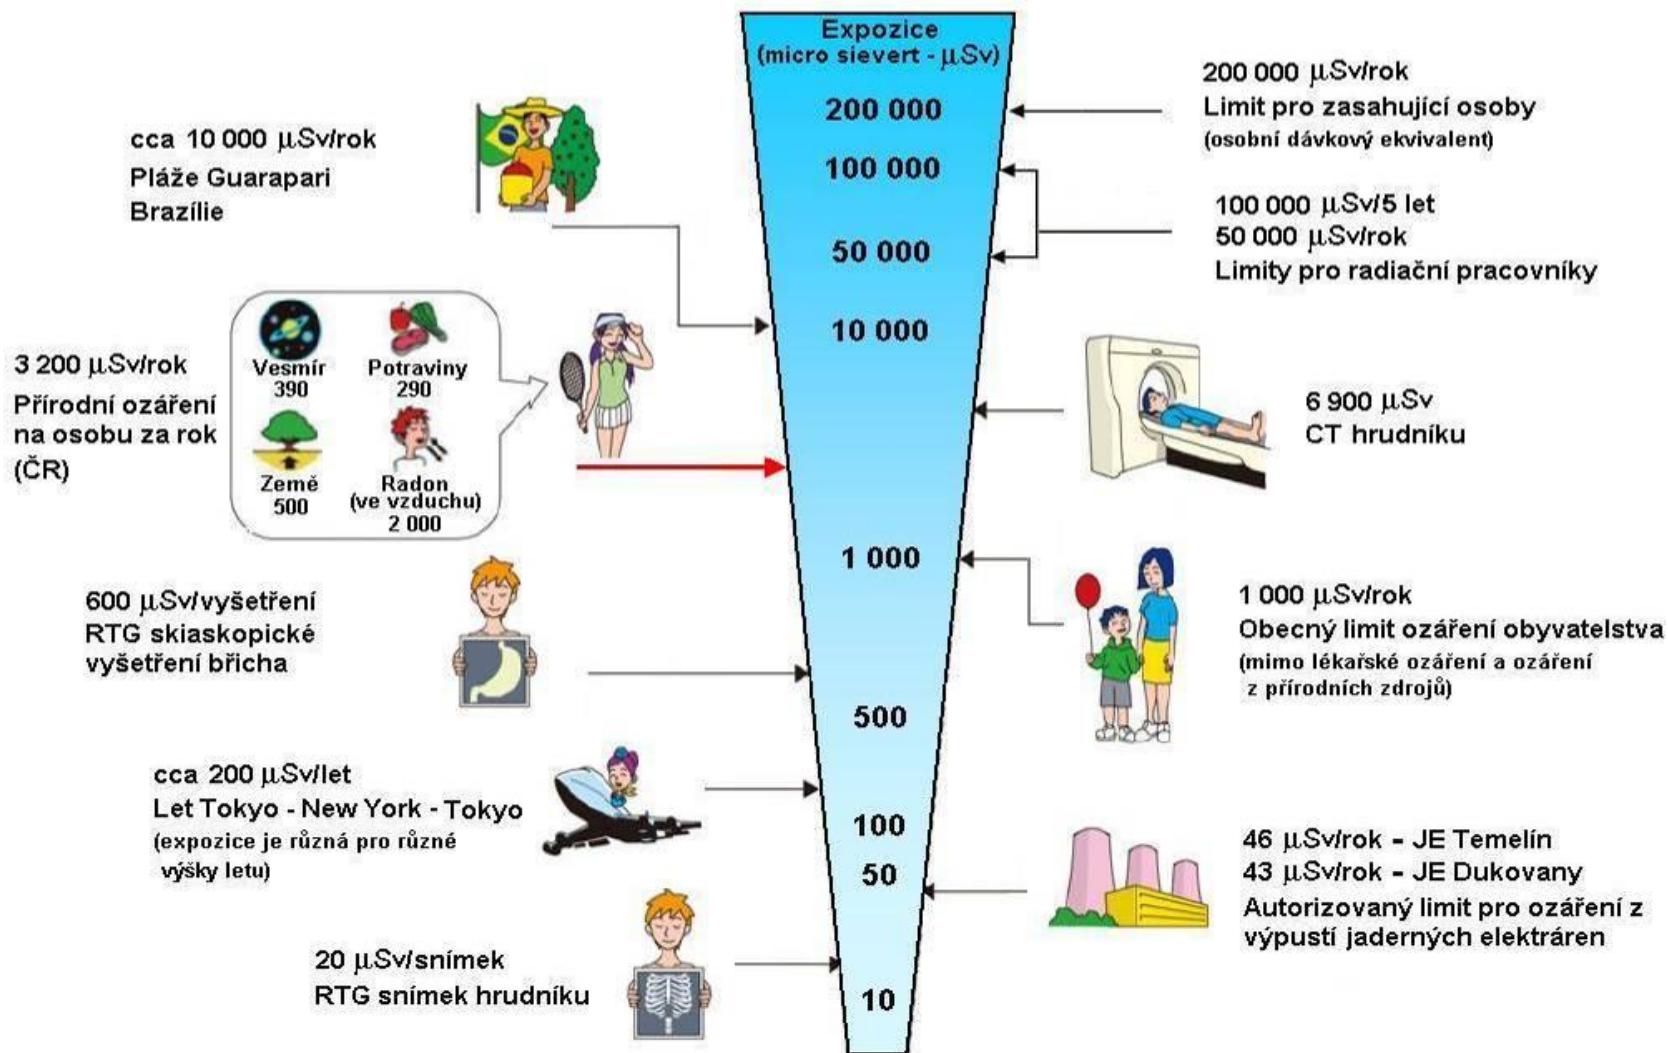

To ensure that during normal operation the radiation exposure inside the device and/or the release of radioactive materials into the environment is as low as reasonably achievable, taking into consideration economic and social factors and prescribed limits and ensure mitigate the extent of exposure to radiation accidents.

The principle of ALARA

Observe the rules and seek new and better ways of performing work

Already applied in the design

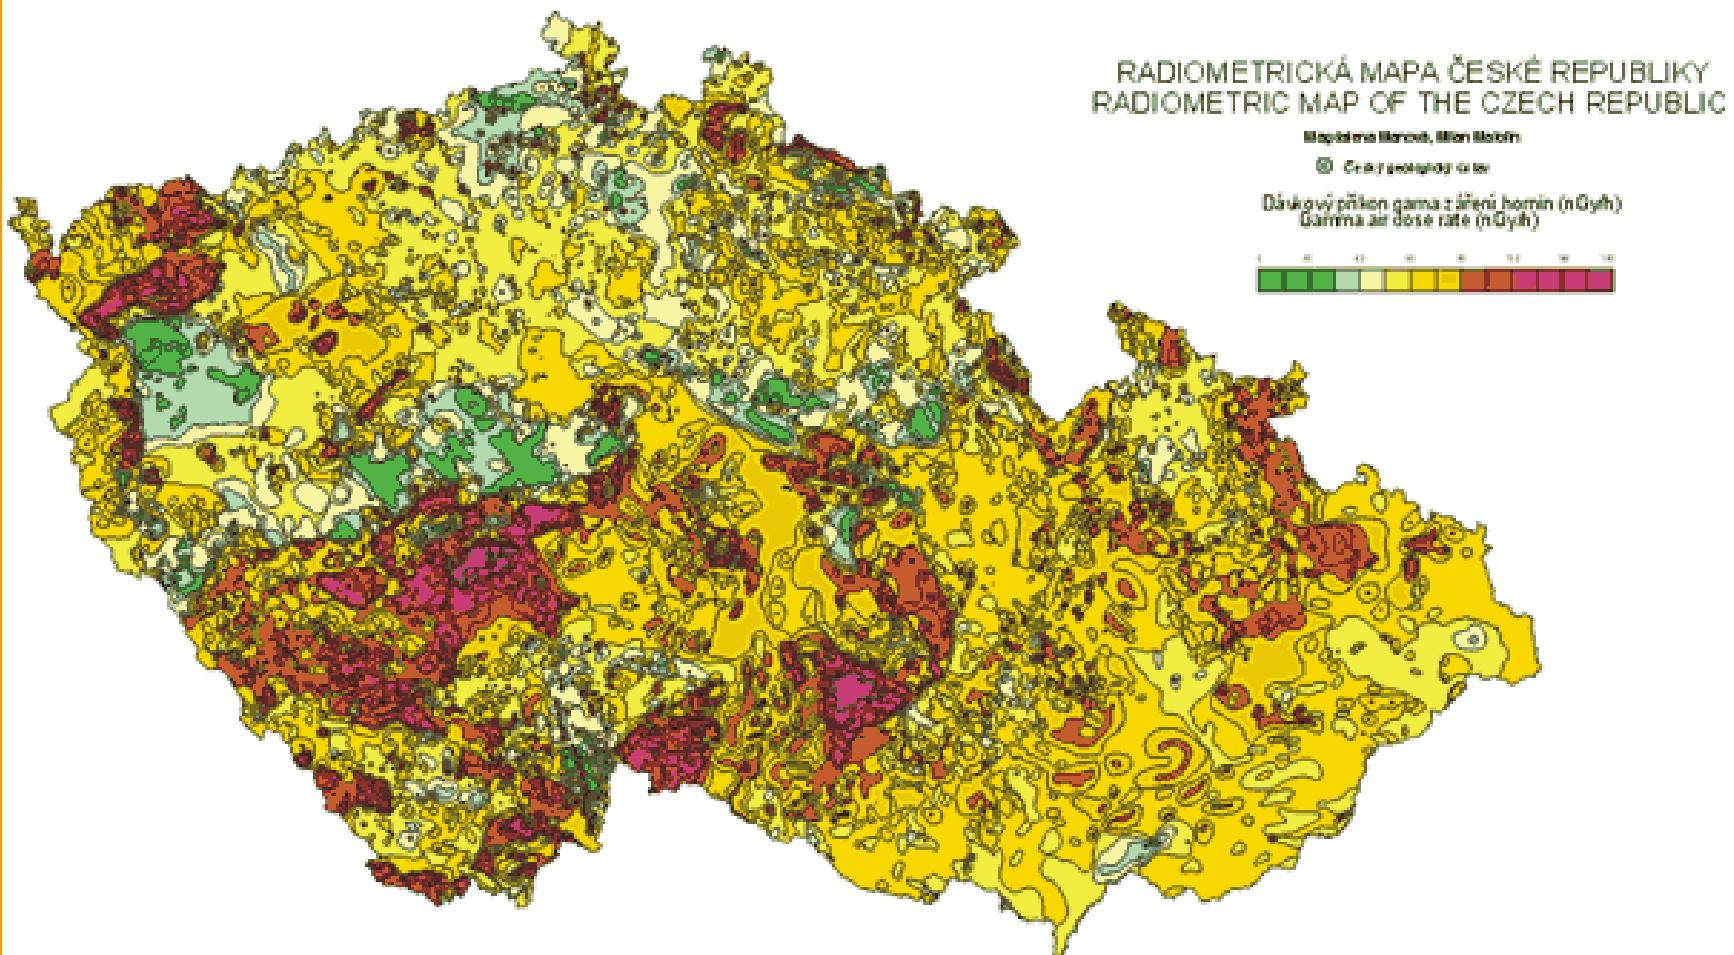

Příklady expozic ionizujícímu záření včetně limitů platných v ČR

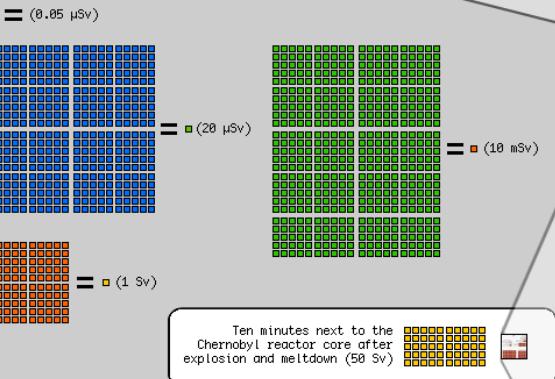

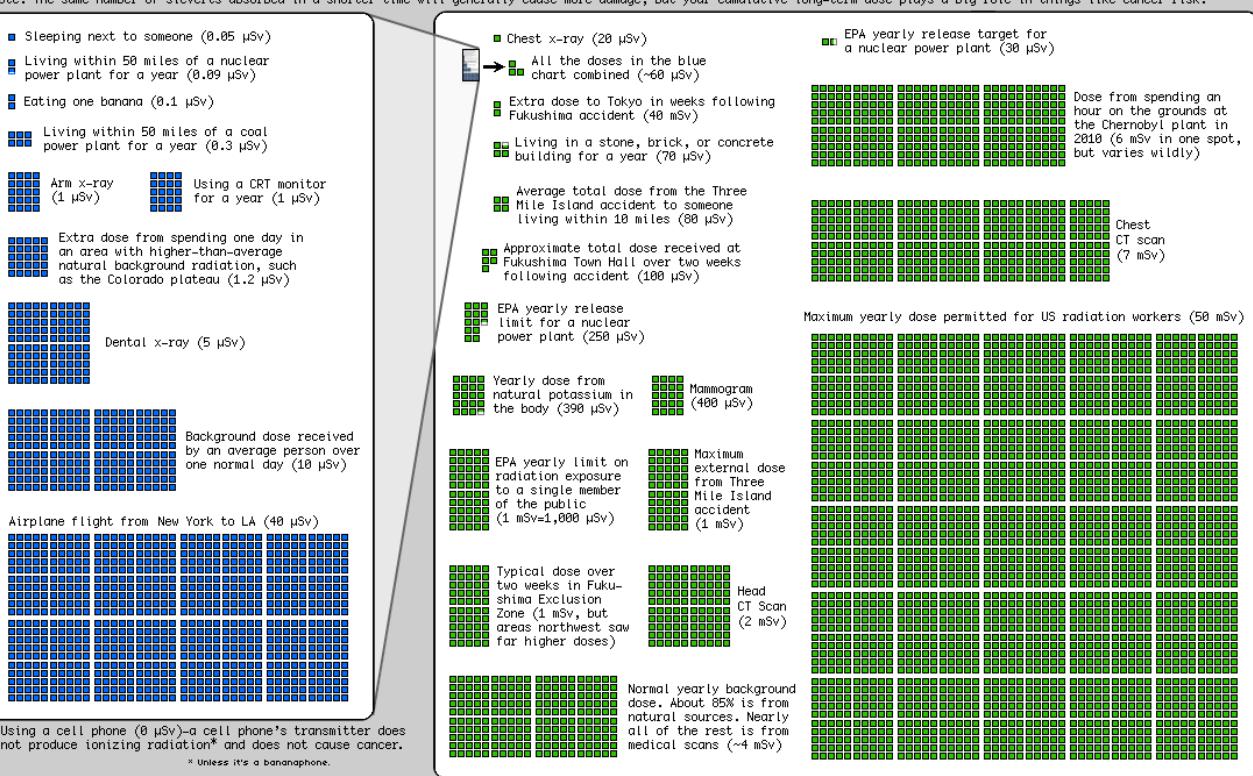

Průměrný dávkový příkon z přírodního pozadí v ČR: $0,14 \text{ } \mu\text{Sv/h} = 1226,4 \text{ } \mu\text{Sv/rok}$

Czech Republic
Iran (Ramsar)
India (Kerala)
Brazil (Guarapari)

- cca 3 mSv/year
- up to 400 mSv/year
- up to 17 mSv/year
- up to 175 mSv/year

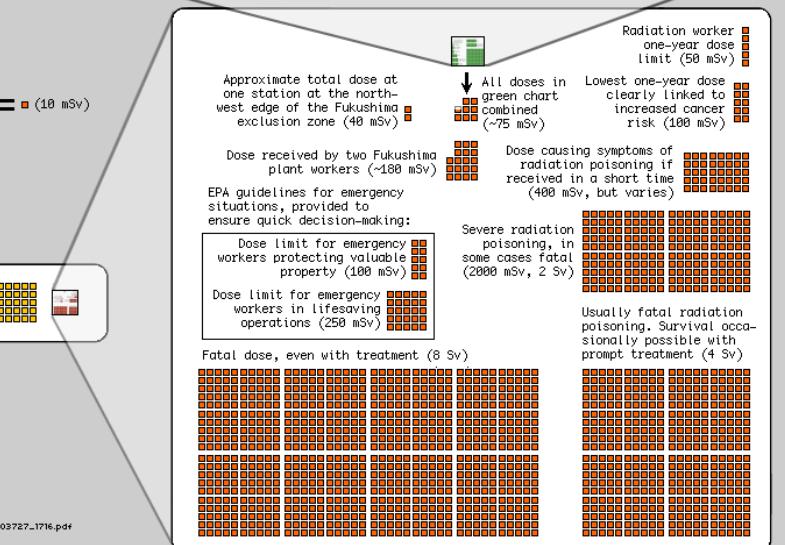

Protection

Chart by Randall Munroe, with help from Ellen, Senior Reactor Operator at the Reed Research Reactor, who suggested the idea and provided a lot of the sources. I'm sure I've added in lots of mistakes; it's for general education only. If you're basing radiation safety procedures on an internet PNG image and things go wrong, you have no one to blame but yourself.

Porovnání rizika

Type of Radiation (dose in mSv)†	Equivalent Period of Natural Background Radiation‡	Estimated Lifetime Risk of dying from cancer that results from a single exposure§
Airport Security x-ray scanner ²³ (~0.0001mSv)	less than one hour	Almost 0 (less than 1 in 100,000,000)
7 hour airplane flight ⁹ (~0.03 mSv)	a few days	Almost 0 (1 in 1,000,000 – 100,000)
Chest x-ray ⁶ (~0.1 mSv)	~ one week	Almost 0 (1 in 1,000,000 – 100,000)
Mammogram ²⁷ (~0.4 mSv)	a few months (~2 months)	1 in 100,000 to 10,000
CT of chest ²⁷ (~7 mSv)	a few years (~2.3 years)	1 in 10,000 to 1,000
Fluoroscopy: colon (barium enema) ²⁷ (~8 mSv)	a few years (~2.7 years)	1 in 10,000 to 1,000
CT of heart (angiography) ²⁷ (~16 mSv)	a few years (~5.3 years)	1 in 10,000 to 1,000
PET scan, whole body ⁵ (~14 mSv)	a few years (~4.6 years)	1 in 10,000 to 1,000
Fluoroscopy: kidneys, ureters and bladder ⁵ (~15 mSv)	a few years (~5 years)	1 in 10,000 to 1,000
Whole-body CT scan ⁵ (~22.5 mSv)	several years (~7.5 years)	1 in 1,000
Nuclear Medicine: Cardiac stress- rest test (thallium) ²⁷ (~40.7 mSv)	many years (~13.6 years)	~2 in 1,000
Transjugular intrahepatic portosystemic shunt placement ²⁷ (~70 mSv)	many years (~23.3 years)	1 in 100 – 1,000
Lifetime risk of cancer death NOT caused by radiation ⁸⁸		1 in 5

Chemical effects of radiation

Effects on human organism

Stochastic (random) - few cells damaged, subliminal dose or repeated small doses.

- we can only calculate the probability of injury, no injury may in fact occur.
- can be detected only by observing a large number of people. Risk of small doses? Scientists still do not match, they can not confirm nor deny it for there is not a sample of people who are not exposed to any radiation at all. No control sample.
- It is known that there is a "protective effect" radiation (hormesis) - in places with higher radioactivity there is less incidence of cancer (cells repair any damage).

Effects on human organism

Non-stochastic effects (deterministic) - after a large dose of radiation, many cells, appear in a short time.

Examples:

local dermatitis

Lenticular opacities

birth defects

fertility

Acute radiation sickness

Protection against outer sources

Protection against earthquake

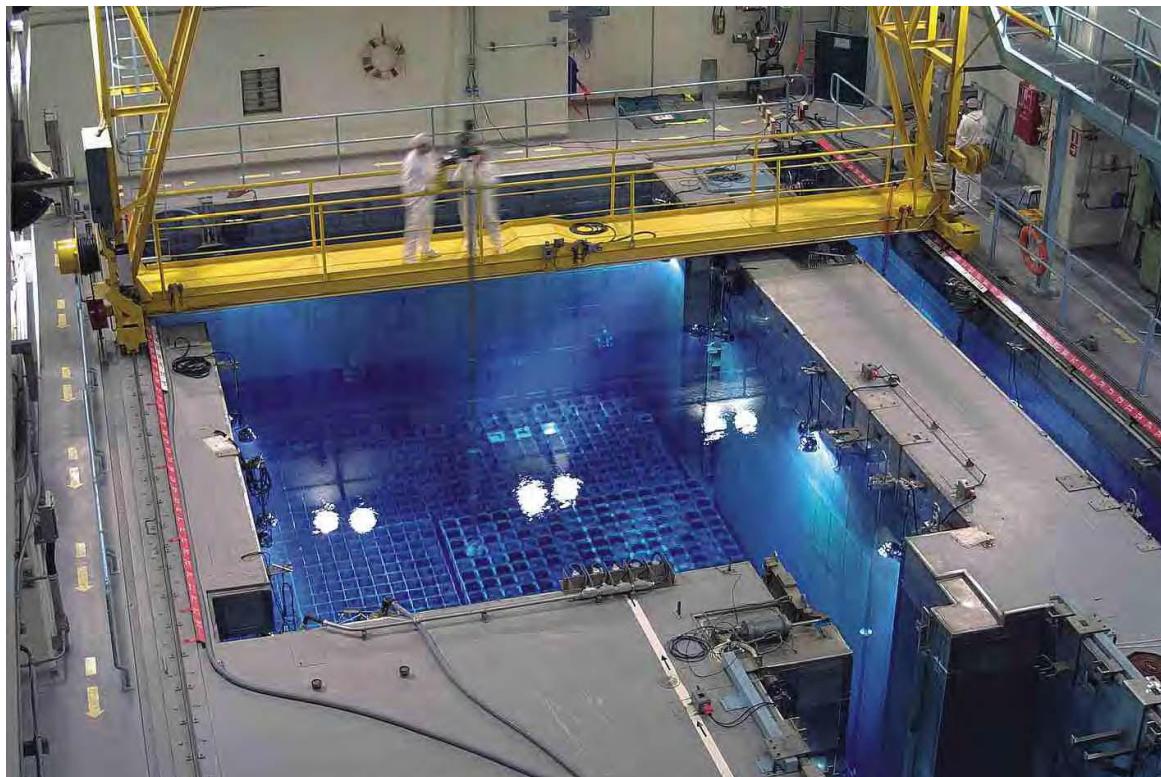

Protection from flood and adverse meteorological phenomena

Protection against pressure waves from explosions

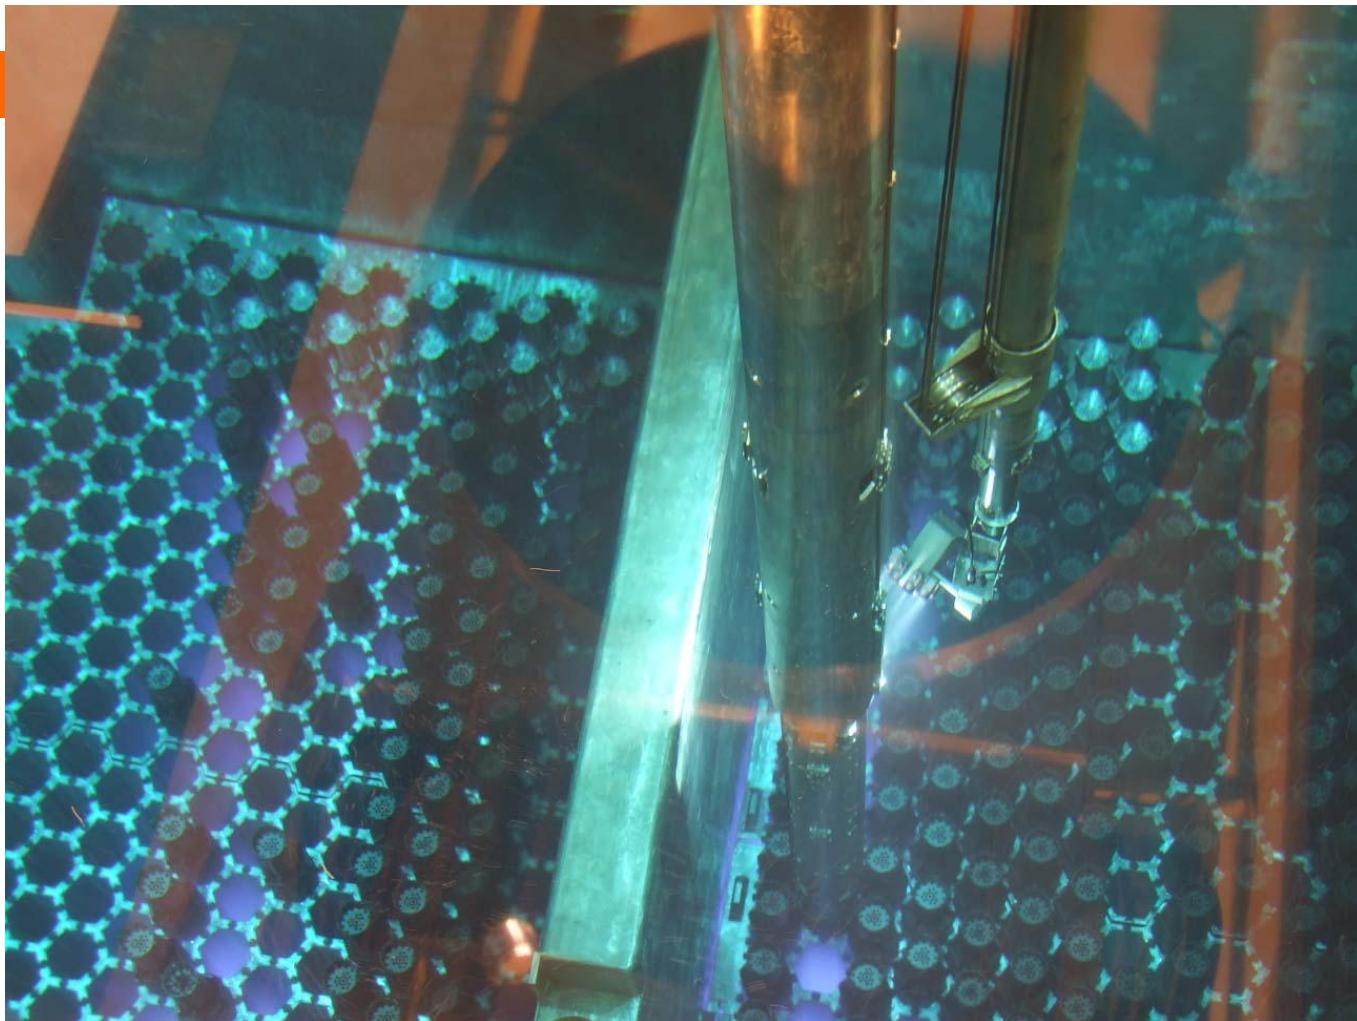

Protection against the effects caused by the fall of the aircraft

Protection against the influence of third parties
