*„No isolated experiment, however significant in itself, can suffice for the experimental demonstration of any natural phenomenon.“*

---

FISHER, 1971, S. 13

# Metaanalýza

---

# Meta-analýza

---

*„Věda má kumulativní povahu, ke studiím však přistupujeme nikoli jako jedné z mnoha, ale izolovaně, stojícími o sobě.“*

◦ (Chalmers, cit. dle Borenstein et al., 2009)

## **Narativní review**

- Expert shrne poznatky k danému tématu a dojde k závěru.
- Subjektivita
- Proces rozhodování není popsán (není replikovatelný).
- Omezení při velkém množství zdrojů.
- Nedostatečné narativní postižení variability velikostí účinku.

# Meta-analýza

---

Od 90. let přechod k meta-analýze a systematické review.

- Proces systematického vyhledávání, hodnocení a následné syntézy dat z velkého počtu zdrojů.

## **Systematická review.**

- Jasně definovaná kritéria pro volbu studií a transparentní popis.
  - Volba kritérií stále zahrnuje určitou míru subjektivity.
- Obvykle zahrnuje meta-analýzu.

## **Meta-analýza.**

- Statistická syntéza předchozího výzkumu .
- Význam té které studie je dán podle vnějších (matematických) pravidel.
- Cílem je odhad „souhrnné velikosti efektu“.

# Meta-analýza: Pojmy

---

Velikost účinku (Effect size)

- **Summary effect** – vážený průměr velikostí účinku dle stanovených pravidel.
- Jde vlastně o odhad „skutečného efektu“ (true effect).

Přesnost summary effectu: celkové N.

Váha dílčích studií: N dané studie.

Homogenita: Míra konzistence napříč studiemi.

Signifikance summary effectu: často i grafická interpretace.

# Meta-analýza: Příklad

## Vaccines are not associated with autism: An evidence-based meta-analysis of case-control and cohort studies

### Odds ratio and 95% CI

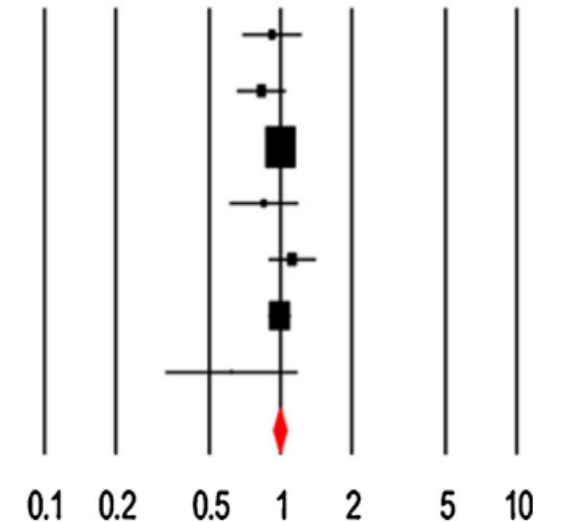

Fig. 2. Combined estimate for vaccines and autism or ASD.

### ABSTRACT

There has been enormous debate regarding the possibility of a link between childhood vaccinations and the subsequent development of autism. This has in recent times become a major public health issue with vaccine preventable diseases increasing in the community due to the fear of a 'link' between vaccinations and autism. We performed a meta-analysis to summarise available evidence from case-control and cohort studies on this topic (MEDLINE, PubMed, EMBASE, Google Scholar up to April, 2014). Eligible studies assessed the relationship between vaccine administration and the subsequent development of autism or autism spectrum disorders (ASD). Two reviewers extracted data on study characteristics, methods, and outcomes. Disagreement was resolved by consensus with another author. Five cohort studies involving 1,256,407 children, and five case-control studies involving 9,920 children were included in this analysis. The cohort data revealed no relationship between vaccination and autism (OR: 0.99; 95% CI: 0.92 to 1.06) or ASD (OR: 0.91; 95% CI: 0.68 to 1.20), nor was there a relationship between autism and MMR (OR: 0.84; 95% CI: 0.70 to 1.01), or thimerosal (OR: 1.00; 95% CI: 0.77 to 1.31), or mercury (Hg) (OR: 1.00; 95% CI: 0.93 to 1.07). Similarly the case-control data found no evidence for increased risk of developing autism or ASD following MMR, Hg, or thimerosal exposure when grouped by condition (OR: 0.90, 95% CI: 0.83 to 0.98;  $p=0.02$ ) or grouped by exposure type (OR: 0.85, 95% CI: 0.76 to 0.95;  $p=0.01$ ). Findings of this meta-analysis suggest that vaccinations are not associated with the development of autism or autism spectrum disorder. Furthermore, the components of the vaccines (thimerosal or mercury) or multiple vaccines (MMR) are not associated with the development of autism or autism spectrum disorder.

## THE STATISTICAL POWER OF ABNORMAL-SOCIAL PSYCHOLOGICAL RESEARCH:

A REVIEW<sup>1</sup>

JACOB COHEN

*New York University*

Given an experimental effect in a population, how likely is the null hypothesis to be rejected? Equivalently, what is the power of the statistical test? What is the expectation that the (false) null hypothesis will be sustained and thus a Type II error committed?

It is a remarkable phenomenon that the research which is reported by psychological investigators rarely refers to this issue, and even more rarely actually investigates it. On the other hand, issues concerning Type I error or "significance," i.e., the validity of the *rejection* of the null hypothesis, are more or less conscientiously attended to. This marked asymmetry of sophistication and attention to these two types of error is mirrored, and largely determined, by the exposition of these issues in the statistics textbooks used in the graduate training of the investigators. These texts are characterized by an early explanation of Type I and Type II errors, followed by a neglect of the latter throughout the remainder of the text. Thus, every statistical test is described with careful attention to

doctoral candidate and sponsor, or author and editor) and rarely on the basis of a Type II error analysis, which can always be performed *prior* to the collection of data. These non-rational bases for setting sample size must often result in investigations being undertaken which have little chance of success despite the actual falsity of the null hypothesis, and probably less often in the use of a far larger sample than is necessary. Either of these circumstances is wasteful of research effort.

Stemming from these considerations, a program of investigation, computation, and reportage has been undertaken whose major aims are as follows:

1. To call these issues to the attention of investigators, consumers of research, and evaluators of research planned or completed (sponsors, agency panels, journal editors).

2. To provide tables and conventional standards which will facilitate the performance of power analyses for the most common statistical tests.

3. To conduct surveys of the psychological

**YEAH, I KEEP TO MYSELF.**

# Radikální skepse II:

## Estimating the reproducibility of psychological science

### Původní velikost efektů:

- Průměrná velikost účinku  
 $M_r = 0,403$ ;  $SD = 0,188$
- Statistická signifikance: 97 % studií  $p < 0,05$

### Replikovaná velikost efektů:

- Průměrná velikost účinku  
 $M_r = 0,197$ ;  $SD = 0,257$
- Statistická signifikance: 36 % studií  $p < 0,05$

Hodnota velikostí účinku z původních studií se nacházela v 95% intervalu spolehlivosti při replikaci v 47 % případů.

# Počátky současné krize

---

DARYL J. BEM

**Feeling the Future (2011)**

JOHN BARGH

**(Elderly) priming (2013)**

# Pochybné praktiky ve výzkumu

---

*„In a poll of more than 2000 psychologists, prevalences of ‘Deciding whether to collect more data after looking to see whether the results were significant’ and ‘Stopping data collection earlier than planned because one found the result that one had been looking for’ were subjectively estimated at 61% and 39%, respectively.“*

- John, Loewenstein, & Prelec, cit. dle Asendorpf et al., 2013

Questionable research practices.

Podvodné vs. pochybné jednání?

- Fraud is typically limited to cases in which researchers create false data.
- In contrast, QRPs typically involve the exclusion of data that are inconsistent with a theoretical hypothesis. QRPs are treated differently than fraud because QRPs can sometimes be used for legitimate purposes. (John, Loewenstein, & Prelec, [2012](#))

# Reproducibility, replicability, generalizability

---

## Reproducibility (Reprodukovatelnost)

- „Researcher B must have the following: (a) the **raw data**; (b) the **code book** (variable names and labels, value labels, and codes for missing data); and (c) knowledge of **the analyses** that were performed by Researcher A (e.g. the syntax of a statistics program).“

## Replicability (Replikovatelnost)

- „The **finding can be obtained with other random samples** drawn from a multidimensional space that captures the most important facets of the research design. In psychology, the facets typically include the following: (a) **individuals** (or dyads or groups); (b) **situations** (natural or experimental); (c) **operationalizations** (experimental manipulations, methods, and measures); and (d) **time points**.“

## Generalizability (Zobecnitelnost)

- „It does not depend on an originally unmeasured variable that has a systematic effect. In psychology, generalizability is often demonstrated by showing that a **potential moderator variable has no effect** on a group difference or correlation.“

# Kde je zakopaný pes?

<u>Questionable Research Practices</u>	<u>OK</u>
1. Not reporting “failed” studies.	83%
2. Not reporting DVs if not significant	92%
3. Not reporting Conditions that “did not work”	89%
4. Excluding data based on effect on p-value.	81%
5. Stopping data collection when significant.	89%
6. Reporting unexpected results “as predicted”	75%

**Table 1.** Likelihood of Obtaining a False-Positive Result

Researcher degrees of freedom	Significance level		
	$p < .1$	$p < .05$	$p < .01$
Situation A: two dependent variables ( $r = .50$ )	17.8%	9.5%	2.2%
Situation B: addition of 10 more observations per cell	14.5%	7.7%	1.6%
Situation C: controlling for gender or interaction of gender with treatment	21.6%	11.7%	2.7%
Situation D: dropping (or not dropping) one of three conditions	23.2%	12.6%	2.8%
Combine Situations A and B	26.0%	14.4%	3.3%
Combine Situations A, B, and C	50.9%	30.9%	8.4%
Combine Situations A, B, C, and D	81.5%	60.7%	21.5%

▲ Original Effect Size

Cohen's  $q$

-3 -2 -1 0 1 2 3

-1.0 -0.5 0.0 0.5 1.0

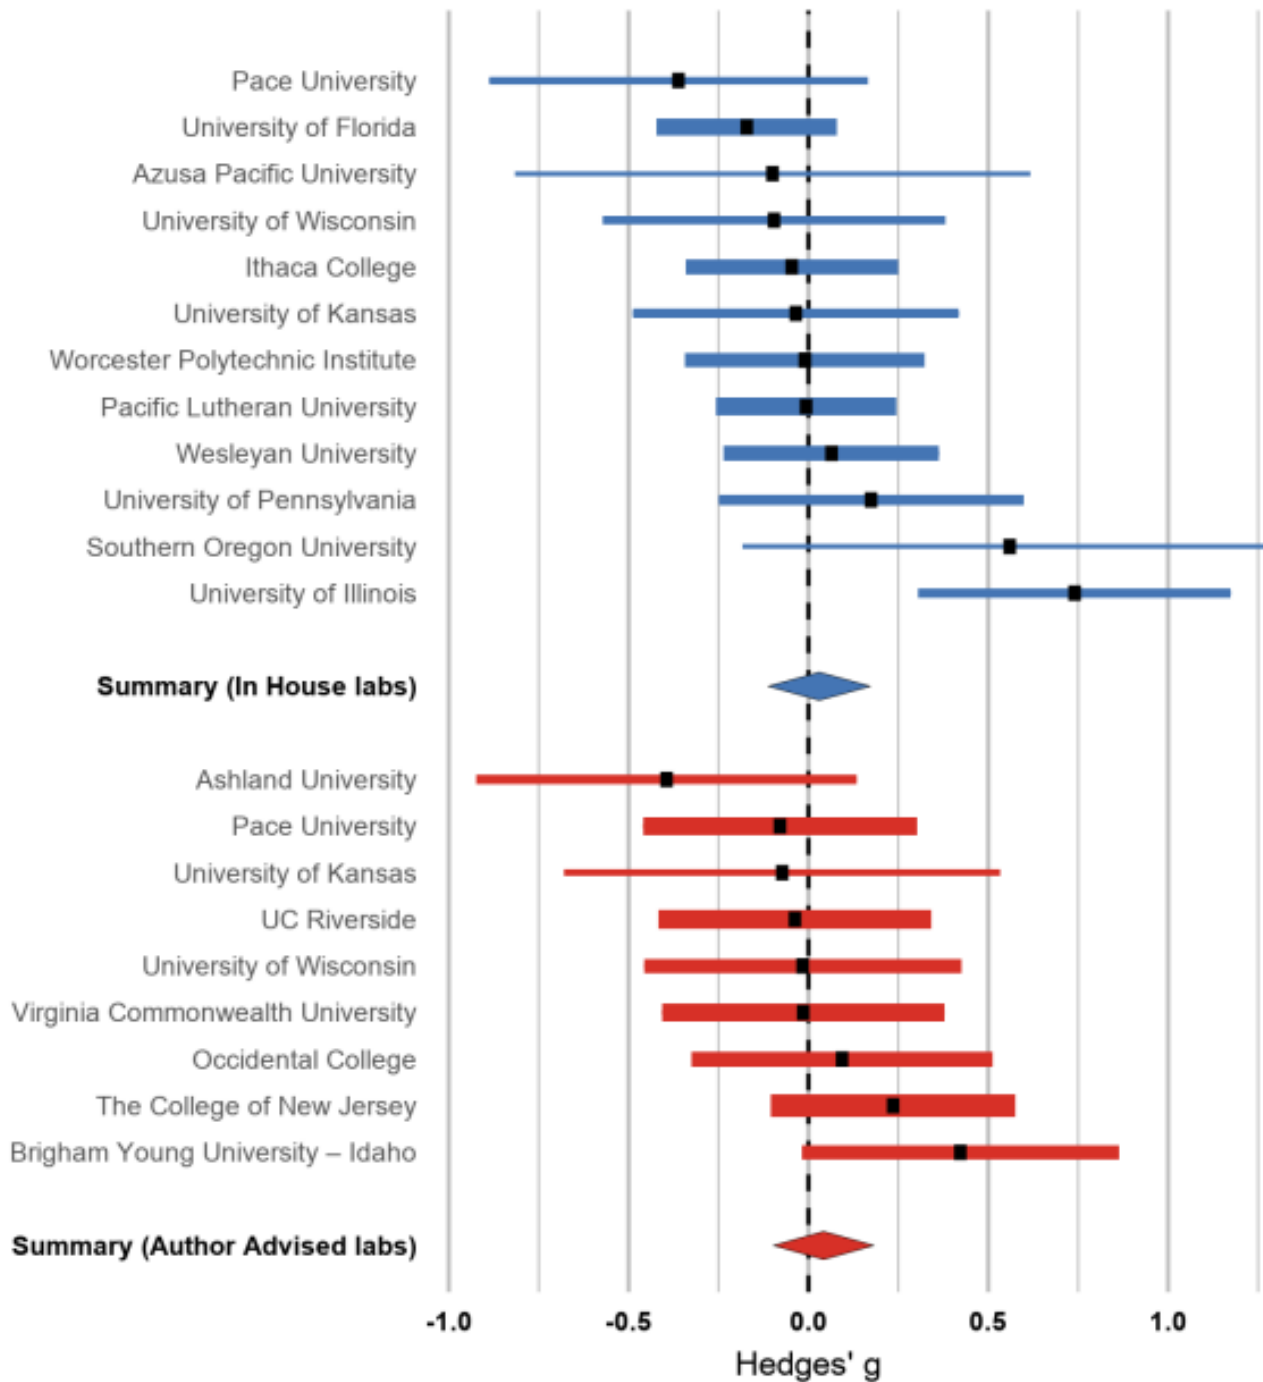

Effect-Size  $r$

**Fig. 2.** Effect-size distributions for the 28 effects. The effect size for each replication sample is plotted as a short vertical line; the aggregate estimates are plotted as longer, thick vertical lines. Results for samples with fewer than 15 participants because of exclusions are not plotted, and some samples were excluded because of errors in administration. A detailed accounting of all exclusions is available at [https://manylabsopen-science.github.io/ML2\\_data\\_cleaning](https://manylabsopen-science.github.io/ML2_data_cleaning). Positive effect sizes indicate effects consistent with the direction of the original findings.

„Across settings, the  $Q$  statistic indicated significant heterogeneity in 11 (39%) of the replication effects, and most of those were among the findings with the largest overall effect sizes; only 1 effect that was near zero in the aggregate showed significant heterogeneity according to this measure. [...] Moderation tests indicated that very little heterogeneity was attributable to the order in which the tasks were performed or whether the tasks were administered in lab versus online. [...] Cumulatively, variability in the observed effect sizes was attributable more to the effect being studied than to the sample or setting in which it was studied.“

### Many Labs 2

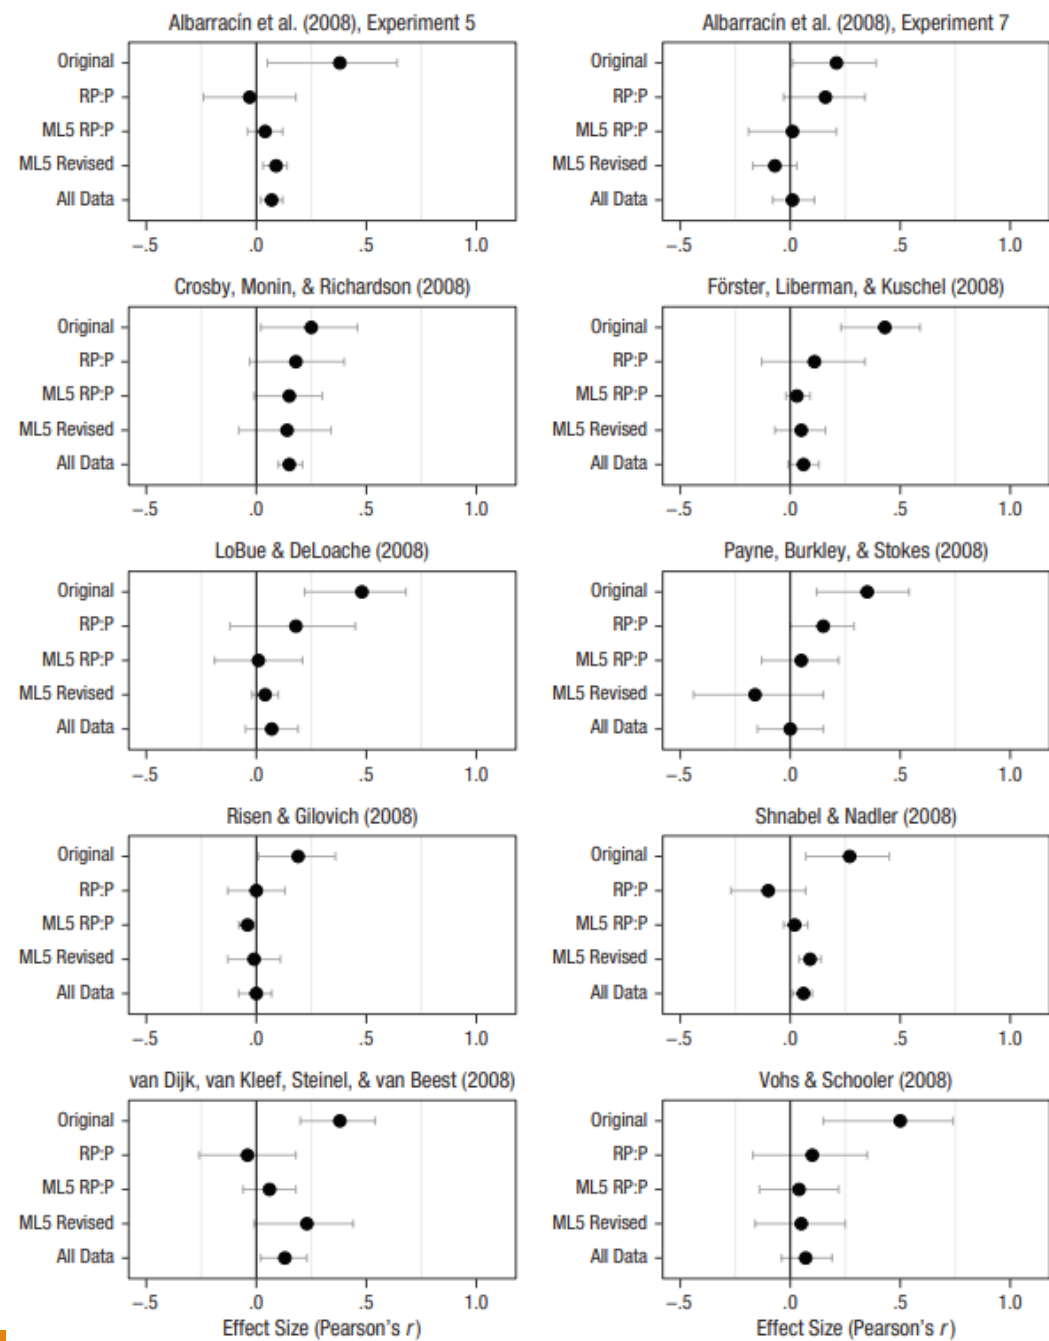

- Klein, R. A., et al. (2018). Many Labs 2: Investigating Variation in Replicability Across Samples and Settings. *Advances in Methods and Practices in Psychological Science*, 1(4), 443–490.

*„We (N = 21 Labs and N = 2,220 participants) experimentally tested whether original author involvement improved replicability of a classic finding from Terror Management Theory (Greenberg et al., 1994). Our results were non-diagnostic of whether original author involvement improves replicability because we were unable to replicate the finding under any conditions. This suggests that the original finding was either a false positive or the conditions necessary to obtain it are not yet understood or no longer exist.“*

**Many Labs 4**

- Klein, R. A., et al. (2019, December 11). Many Labs 4: Failure to Replicate Mortality Salience Effect With and Without Original Author Involvement.
- preprint

*„If these [replication] studies use methods that are unfaithful to the original study or ineffective in eliciting the phenomenon of interest, then a failure to replicate may be a failure of the protocol rather than a challenge to the original finding. Formal pre-data-collection peer review by experts may address shortcomings and increase replicability rates. [...] Overall, following the preregistered analysis plan, we found that the revised protocols produced effect sizes similar to those of the RP:P protocols ( $\Delta r = .002$  or  $.014$ , depending on analytic approach).“*

- Many Labs 5**
- Ebersole, C.R., et al. (2020). Many Labs 5: Testing Pre-Data-Collection Peer Review as an Intervention to Increase Replicability. *Advances in Methods and Practices in Psychological Science*, 3(3), 309–331.

**Fig. 2.** Effect sizes from the 10 original studies and their replications in the Reproducibility Project: Psychology (RP:P; Open Science Collaboration, 2015) and the Many Labs 5 (ML5) protocols. The "All Data" results are estimates from random-effects meta-analyses including the original studies and their replications. Error bars represent 95% confidence intervals.

*„We identified all large NHLBI supported RCTs between 1970 and 2012 evaluating drugs or dietary supplements for the treatment or prevention of cardiovascular disease. Trials were included if direct costs >\$500,000/year, participants were adult humans, and the primary outcome was cardiovascular risk, disease or death. [...] The number NHLBI trials reporting positive results declined after the year 2000. Prospective declaration of outcomes in RCTs, and the adoption of transparent reporting standards, as required by clinicaltrials.gov, may have contributed to the trend toward null findings.“*

**[A Multilab Preregistered Replication of the Ego-Depletion Effect](#)**

- Hagger, M. S., et al. (2016). A Multilab Preregistered Replication of the Ego-Depletion Effect. *Perspectives on Psychological Science*, 11(4), 546–573.

Figure 1. Forest Plot of Performance Outcome by Laboratory. The box plots and numerical values illustrate the same effect size estimates. For the plots, the size of the box represents its weighted contribution to the overall effect and its whiskers display 95% CIs. The dotted line represents a zero effect size. Numerical values show standardized mean differences between depletion and non-depletion conditions expressed in Cohen's  $d$  (with 95% CIs). The diamond is the overall meta-analytic effect derived from a random-effects model.

„We conducted a preregistered multi-laboratory project ( $k = 36$ ;  $N = 3531$ ) to assess the size and robustness of ego depletion effects using a novel replication method, termed the paradigmatic replication approach. [...] non-significant result,  $d = 0.06$ . Confirmatory Bayesian meta-analyses using an informed prior hypothesis ( $\delta = 0.30$ ;  $SD = 0.15$ ) found the data were four times more likely under the null than the alternative hypothesis. Hence, preregistered analyses did not find evidence for a depletion effect.“

# Doporučení: Design a analýza

---

## Zmenšit chybu měření

- Zvýšením velikosti vzorku
- Zvýšením statistické síly
- Zvýšením reliability měřícího nástroje
- Korektním užíváním korekcí pro vícenásobná srovnání
  - Užívání postupů typu Bonferroniho korekce snižuje statistickou sílu

## Od " $p < 0,05$ " k...

- ... reportování skutečné velikosti " $p$ "
- ... důrazu na ukazatele velikosti účinku
- ... důrazu na intervaly spolehlivosti apod.

# Doporučení: Publikační proces

---

Autoři studií, výzkumníci: **transparence.**

- Literature review ve vztahu k dosavadnímu stavu replikace.
  - Existují dřívější replikační studie? Podařilo se původní výsledek replikovat? Apod.
- Zdůvodnění volby velikosti vzorku
- Zveřejnění dat, postupů analýz, work-in-progress, pre-registrací
- Provádění replikací, účast na diskuzích odborné veřejnosti atd.

Žurnály, recenzenti, editoři: **Podpora dobrých výzkumných praktik.**

- Publikování replikací a podpora autorů v této činnosti
- Ústup od konfirmačního zkreslení v publikačním procesu

# Doporučení: Vyučující metodologie

---

Aneb: **Co mají studenti chtít po svých učitelích?**

**Rigorózní výuka** metodologie, statistické analýzy dat apod.

- Statistická síla, velikost účinku, zobecnitelnost atd.
- Informace o replikovatelnosti efektů při výuce jiných kurzů.

Podpora **transparentnosti**.

- Publikování dat, skriptů apod., analýza takovýchto souborů.

Podpora **studentských replikací**.

- Přínos pro studenty i pro obor.

Podpora **kritického myšlení**.

- Obsahuje studie veškeré podstatné informace? Zvolili výzkumníci vhodnou proceduru pro ověření stanovené hypotézy? Jsou závěry korektně interpretovány?
- Na úrovni jednotlivých studií i v rámci meta-analýz

# Doporučení: Instituce

---

## **Změna Publish or Perish politiky:**

- Počet publikací a impact faktor jako rozhodující proměnná při přidělování grantů, přijetí do zaměstnání či kariérním postupu

## **Alternativy:**

- Oceňování a podpora replikační činnosti
- Vynaložení části prostředků v rámci výzkumu na replikaci

# Doporučení: Obor

---

Přesun od efektů k teoriím.

Přesun od dílčích studií k agregaci výzkumného poznání.

Větší důraz na způsob, kvalitu a podstatu měření.

- Vzhledem k měřenému atributu.

Větší míra standardizace výzkumných nástrojů.

Adekvátní statistické postupy.

# Příklady dobré praxe

# Registered Replication Report

## Registered Replication Reports

Multi-lab, high-quality replications of important experiments in psychological science along with comments by the authors of the original studies.

### Quick Links

- [Mission Statement](#)
- [Article Type Description](#)
- [Funding Opportunity](#)
- [Instructions for Authors](#)
- [Instructions for Reviewers](#)
- [Ongoing Replication Projects](#)

### Mission Statement

Replicability is a cornerstone of science. Yet replication studies rarely appear in psychology journals. The new **Registered Replication Reports** article type in *Perspectives on Psychological Science* fortifies the foundation of psychological science by publishing collections of replications based on a shared and vetted protocol. It is motivated by the following principles:

- Psychological science should emphasize findings that are robust, replicable, and generalizable.
- Direct replications are necessary to estimate the true size of an effect.
- Well-designed replication studies should be published regardless of the size of the effect or statistical significance of the result.

**THERE ARE TWO POSSIBLE ARTICLES YOU CAN WRITE: (1) THE ARTICLE YOU PLANNED TO WRITE WHEN YOU DESIGNED YOUR STUDY**

**OR (2) THE ARTICLE THAT MAKES THE MOST SENSE NOW THAT YOU HAVE SEEN THE RESULTS. THEY ARE RARELY THE SAME, AND THE CORRECT ANSWER IS (2).**

# What is Preregistration?

When you preregister your research, you're simply specifying your research plan in advance of your study and submitting it to a registry.

Preregistration separates *hypothesis-generating* (exploratory) from *hypothesis-testing* (confirmatory) research. Both are important. But the same data cannot be used to generate *and* test a hypothesis, which can happen unintentionally and reduce the credibility of your results. Addressing this problem through planning improves the quality and transparency of your research. This helps you clearly report your study and helps others who may wish to build on it.

For additional insight and context, you can read [The Preregistration Revolution](#). (preprint)

# Velikost vzorku

Používání větších datových souborů.

Pečlivá power-analýza.

The screenshot shows the G\*Power 3.1.9.2 software interface. The window title is "G\*Power 3.1.9.2" and the menu bar includes "File", "Edit", "View", "Tests", "Calculator", and "Help". The main area is divided into two tabs: "Central and noncentral distributions" and "Protocol of power analyses". The "Protocol of power analyses" tab is active, showing a large empty text area. Below this, the "Test family" is set to "t tests" and the "Statistical test" is "Means: Wilcoxon signed-rank test (matched pairs)". The "Type of power analysis" is "A priori: Compute required sample size - given  $\alpha$ , power, and effect size". The "Input Parameters" section includes "Tail(s)" set to "One", "Parent distribution" set to "Normal", "Effect size dz" set to "0.5", " $\alpha$  err prob" set to "0.05", and "Power (1- $\beta$  err prob)" set to "0.95". The "Output Parameters" section includes "Noncentrality parameter  $\delta$ ", "Critical t", "Df", "Total sample size", and "Actual power", all with question marks in their input fields. At the bottom, there are buttons for "Options", "X-Y plot for a range of values", and "Calculate".

# A 21 Word Solution

Choir: There is no need to wait for everyone to catch-up with your desire for a more transparent science. If *you* did not *p*-hack a finding, *say it*, and your results will be evaluated with the greater confidence they deserve.

If you determined sample size in advance, *say it*.

If you did not drop any variables, *say it*.

If you did not drop any conditions, *say it*.

These 21 words in a Methods section can *say it* succinctly:

**“We report how we determined our sample size, all data exclusions (if any), all manipulations, and all measures in the study.”**

When needed, supplemental materials can be used to ensure the 21 words are accurate.

When sample size is not determined in advance, one could write:

“We added 50 observations after analyzing the first 100”.
