

Test questions - example

<i>Name and surname (use the box below):</i>	<i>ID number (učo)</i>	<i>Test sheet No.:</i>
		1

1

Regulation of the progression of cell cycle often fails. Fortunately, such failure is of no significance in terms of disease development.

A No

B Yes

2

Contractile ring in the cytokinesis of the animal cells contains mainly intermediate filaments of lamins

A Yes

B No

3

Growth of oocytes that takes place in ovaries during fetal development represents a key period in terms of accumulation of molecules (mRNA, proteins) that are crucial for autonomy of early embryogenesis.

A No

B Yes

4

Prokaryotic promoter binds repressors of translation

A No

B Yes

5

Sickle-cell anemia is named because of sickled leukocytes

A Yes

B No

<i>Name and surname (use the box below):</i>	<i>ID number (učo)</i>	<i>Test sheet No.:</i>
		2

1

In the mechanism of chromosome separation at anaphase B (late anaphase) the two spindle poles move apart

A No

B Yes

2

Non-disjunction of autosomes may result in Turner syndrome

A No

B Yes

3

Transcription starts downstream from Shine-Dalgarno sequence (ribosome binding site)

A Yes

B No

4

Prions are infectious fragments of RNA which cause some central nervous system diseases

A No

B Yes

5

Mutation which requires specific conditions to become expressed in the phenotype is referred to as conditional mutation

A Yes

B No
