

Class II. cavity preparation

Defects affecting one or both proximal surfaces of posterior teeth.

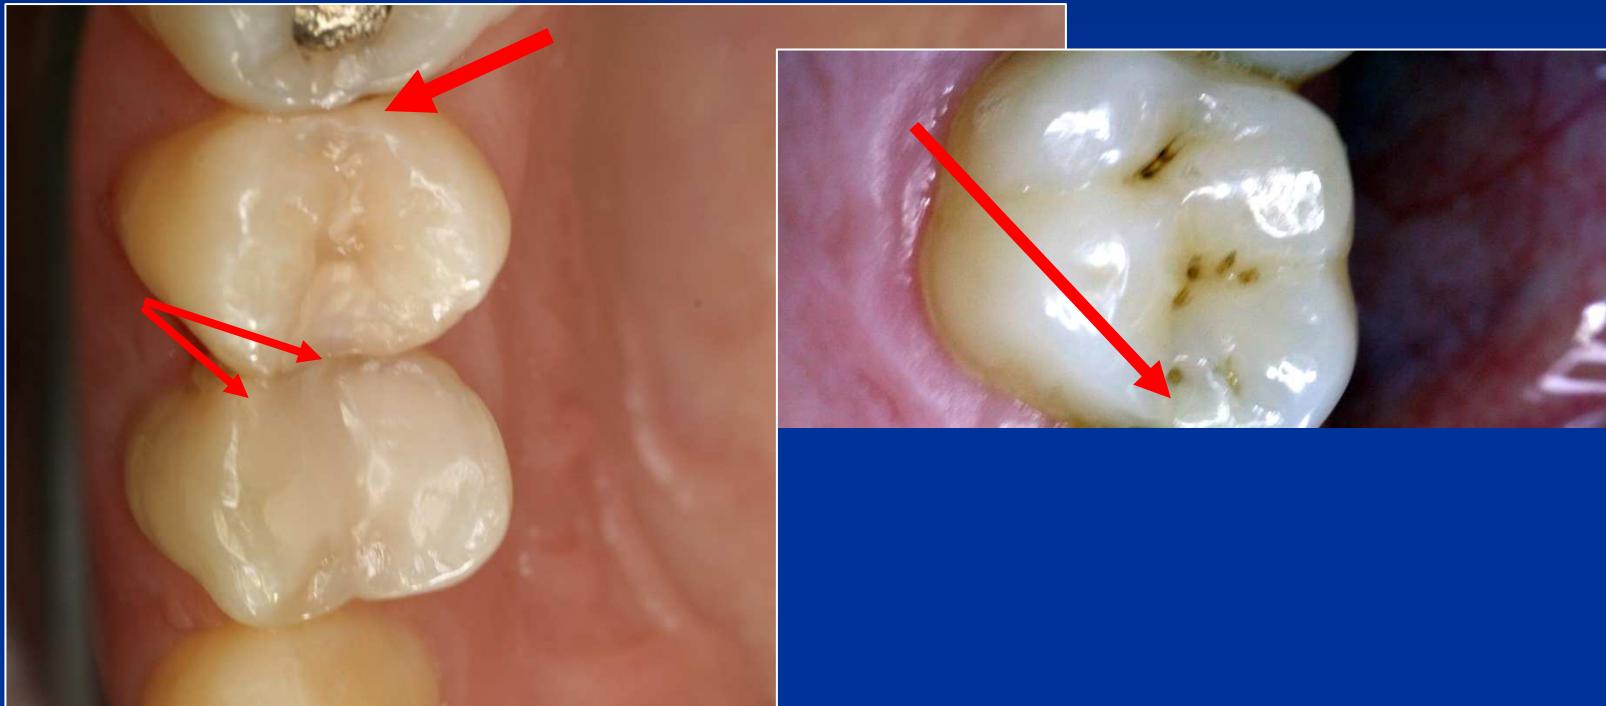

Symptoms

- No symptoms
- Increased sensitivity (cold, sweet)
- Retention of food
- Defect (carious lesion is open – the enamel is broken)
- Bite sensitivity (when carious lesion is open)

Diagnosis

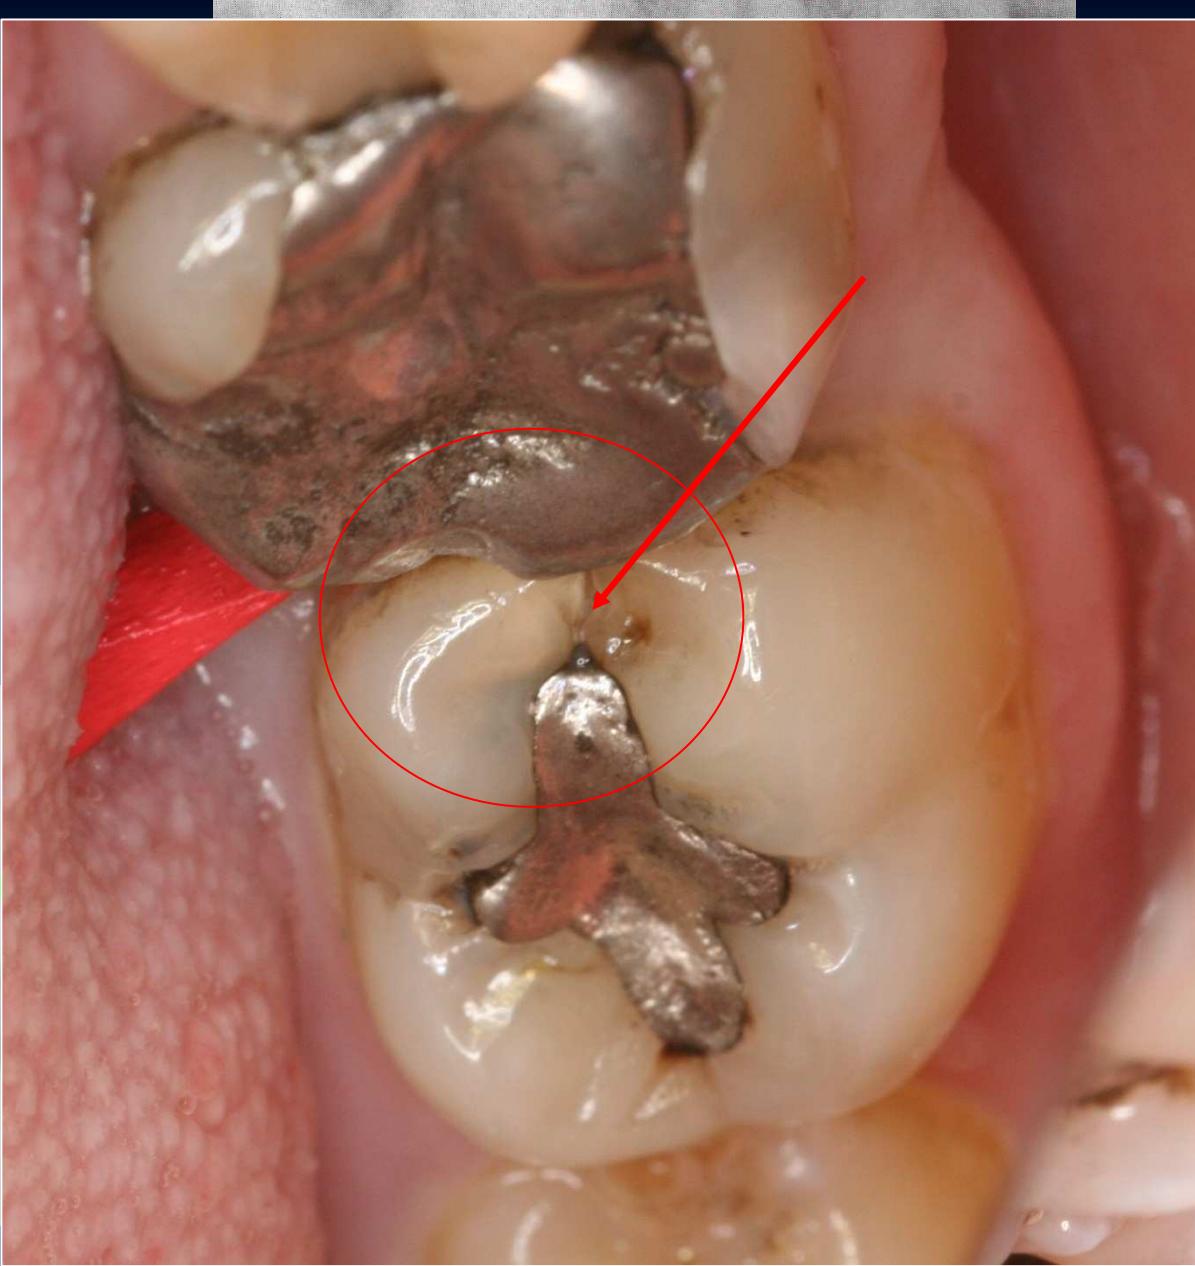

- Visual changes of tooth structure
- Transillumination
- Radiography

lroubal@med.muni.cz

KTG vysetrem – bite wing

lroubal@med.muni.cz

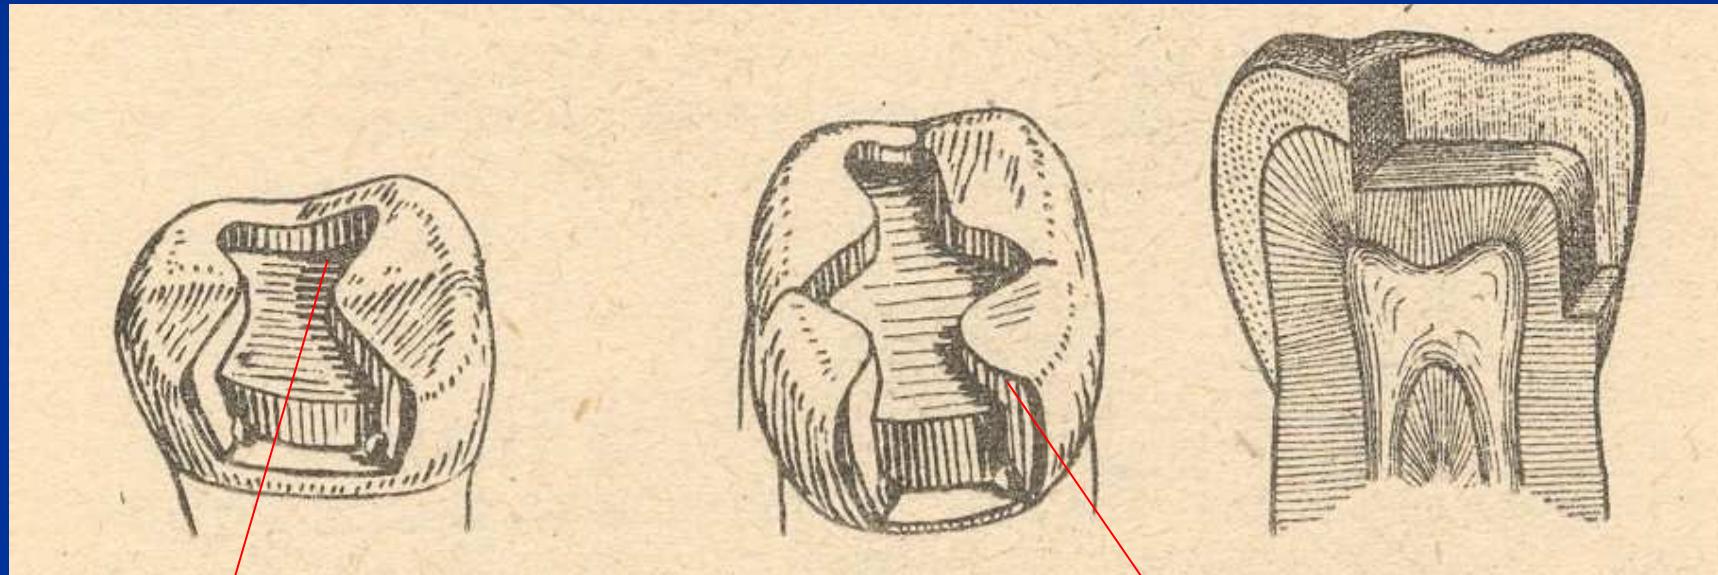

Preparation - amalgam

- Conventional preparation acc. to the Black´s rules
- Slot preparation
- Large preparation – cusp(s) involved

Preparation - adhesive materials

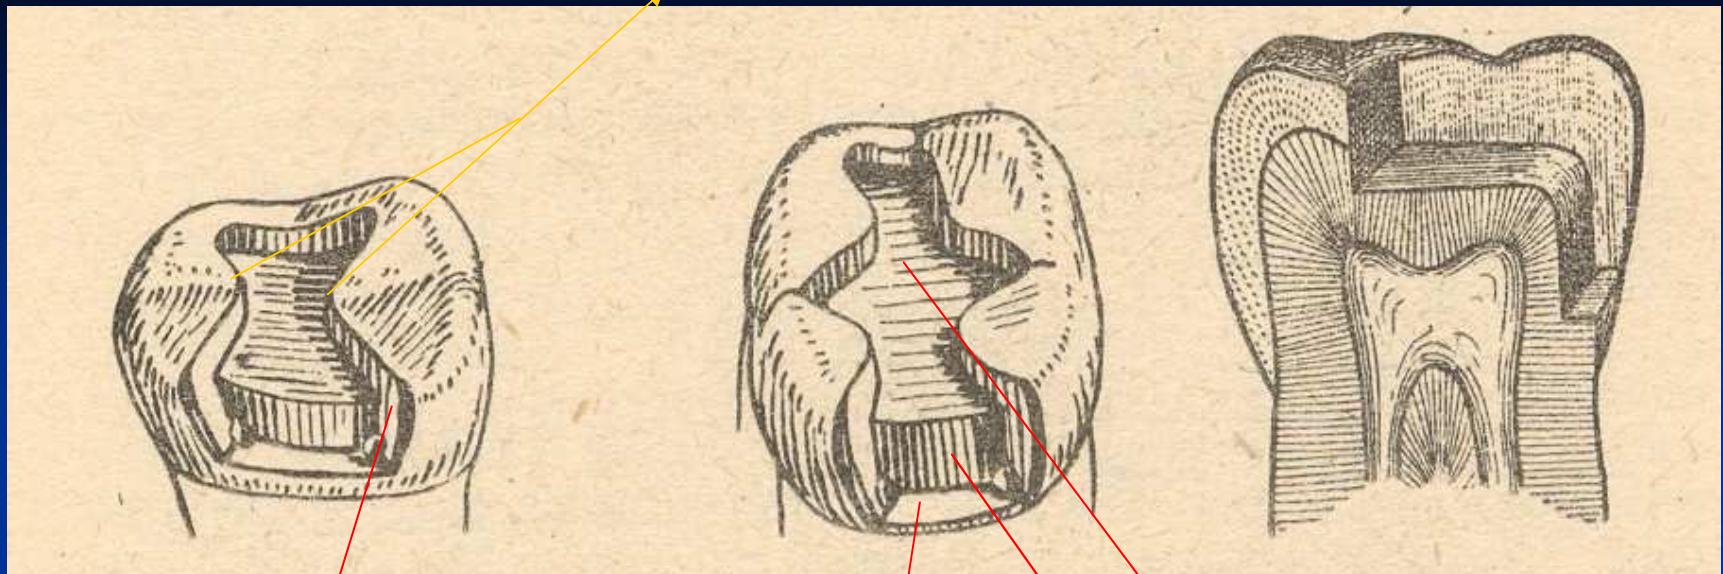

- Conventional preparation for composites
- Adhesive slot
- Tunnel preparation

Conventional preparation

Occlusal cavity

Proximal cavity - box

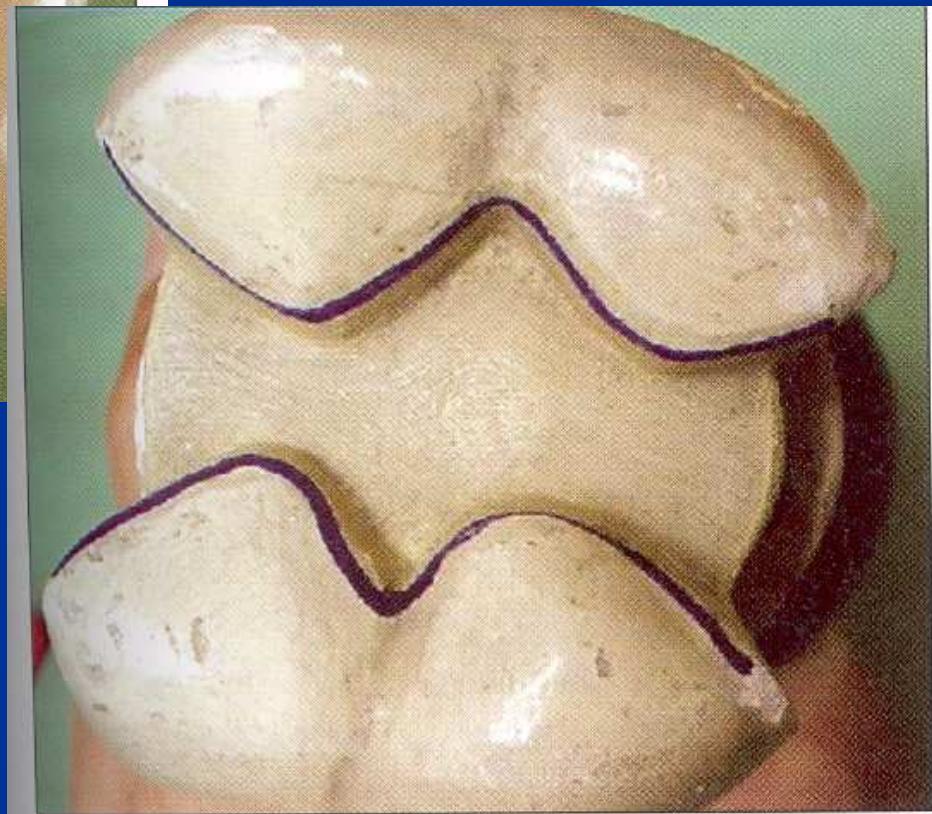

Isthmus

Axial wall

Gingival wall

Pulpal walls

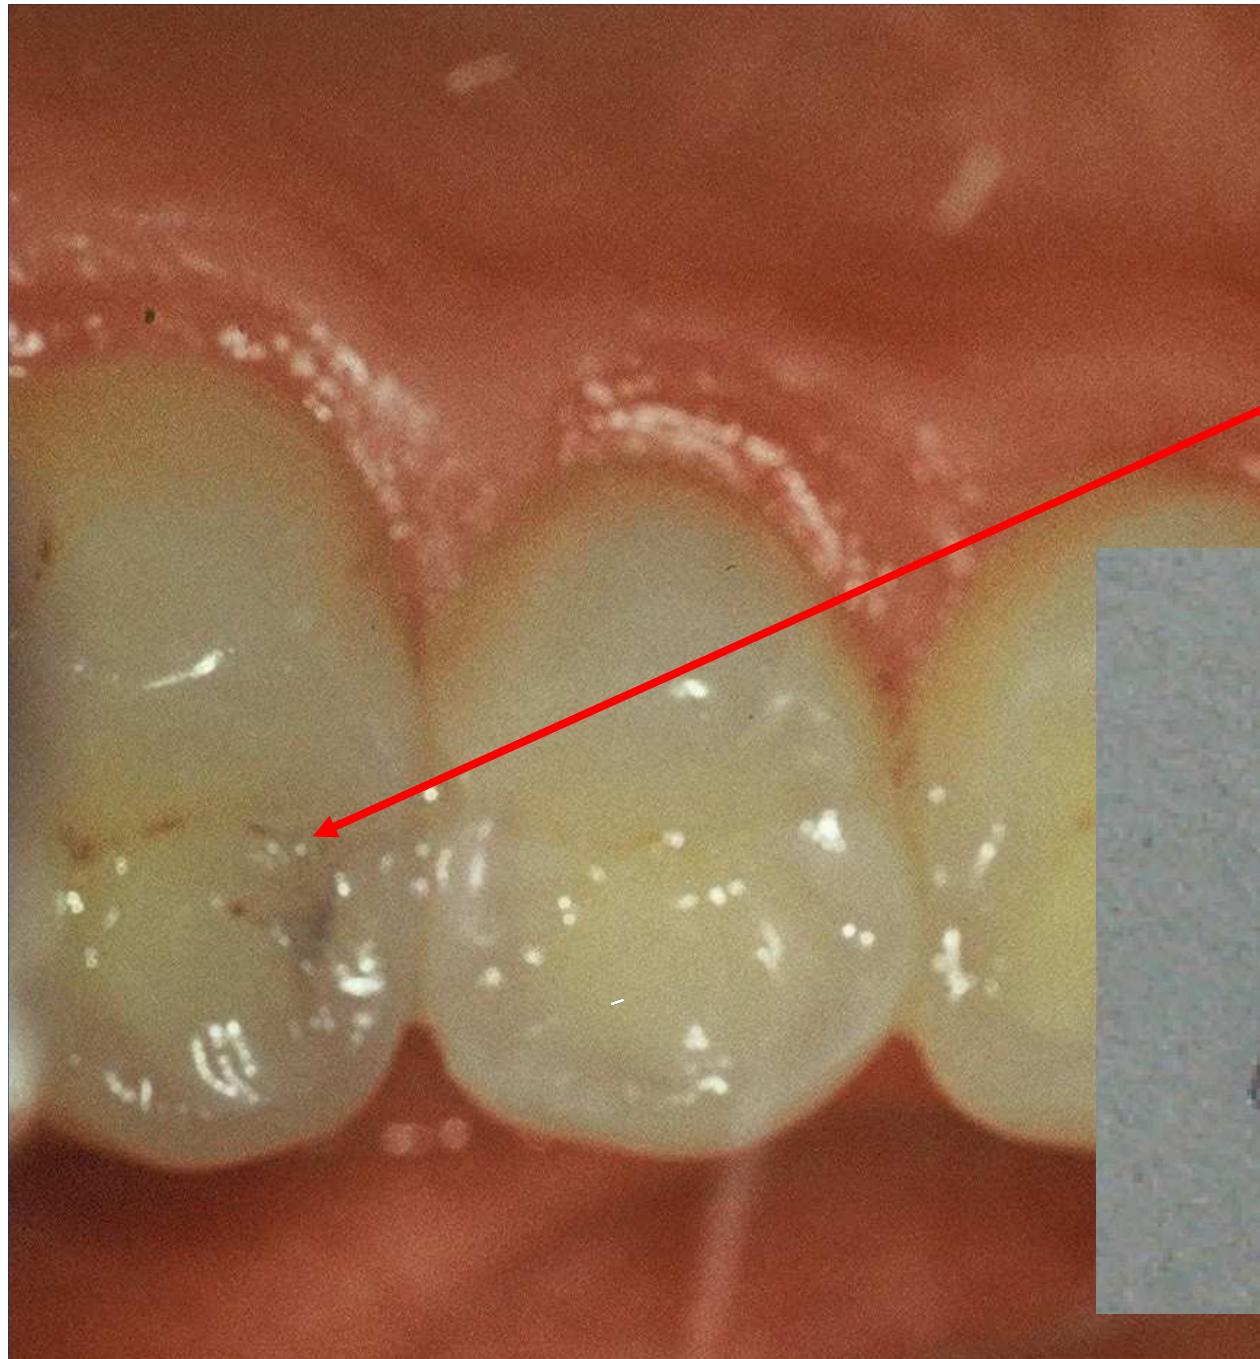

MO – mesioocclusal
OD occlusal – distal
MOD

Access to the cavity

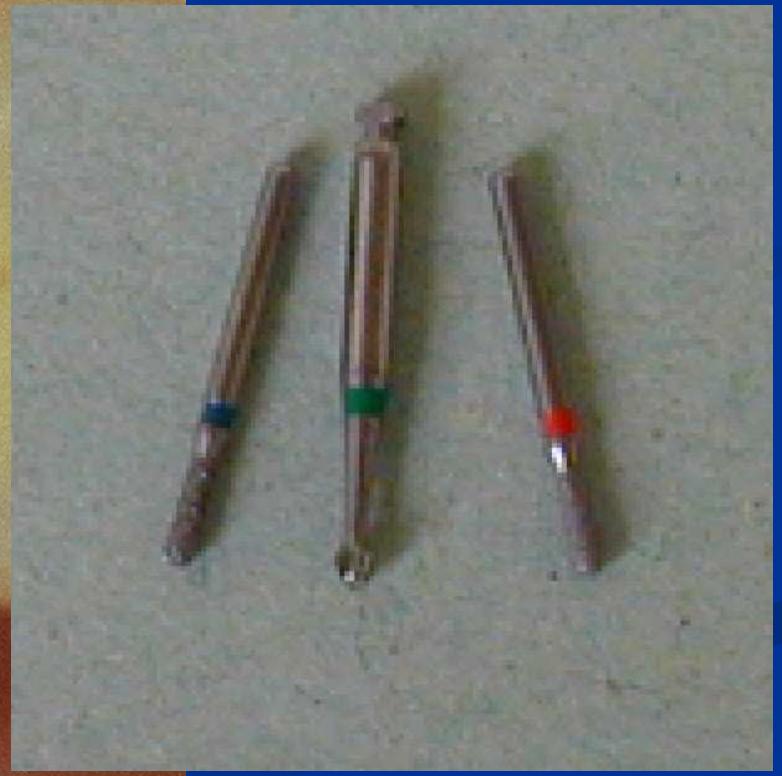

From the occlusal surface

Through the undermined enamel

Separation using wooden wedges is useful

Pre op

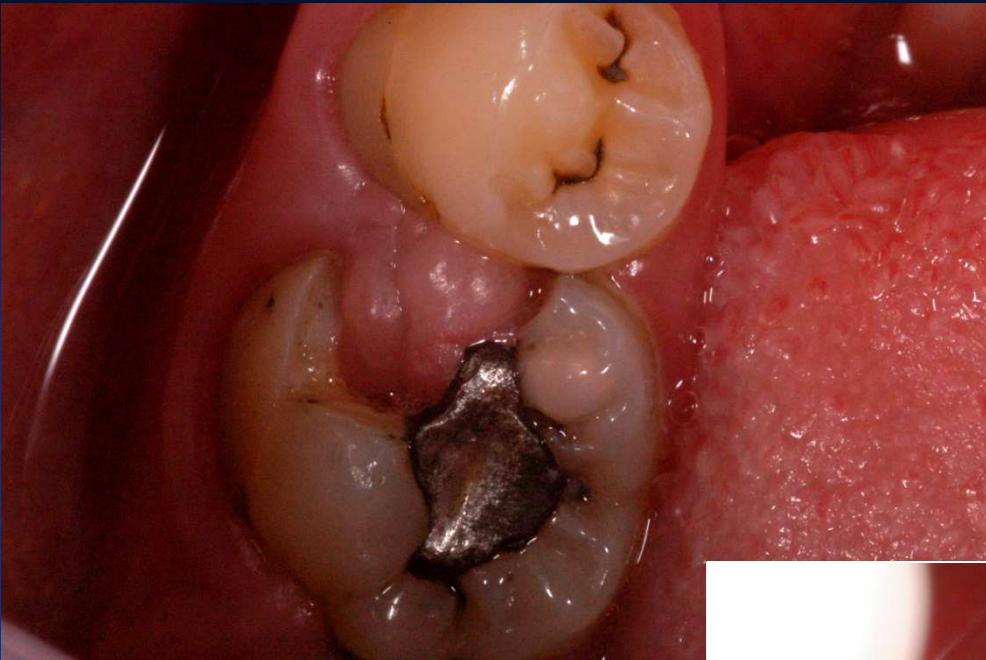

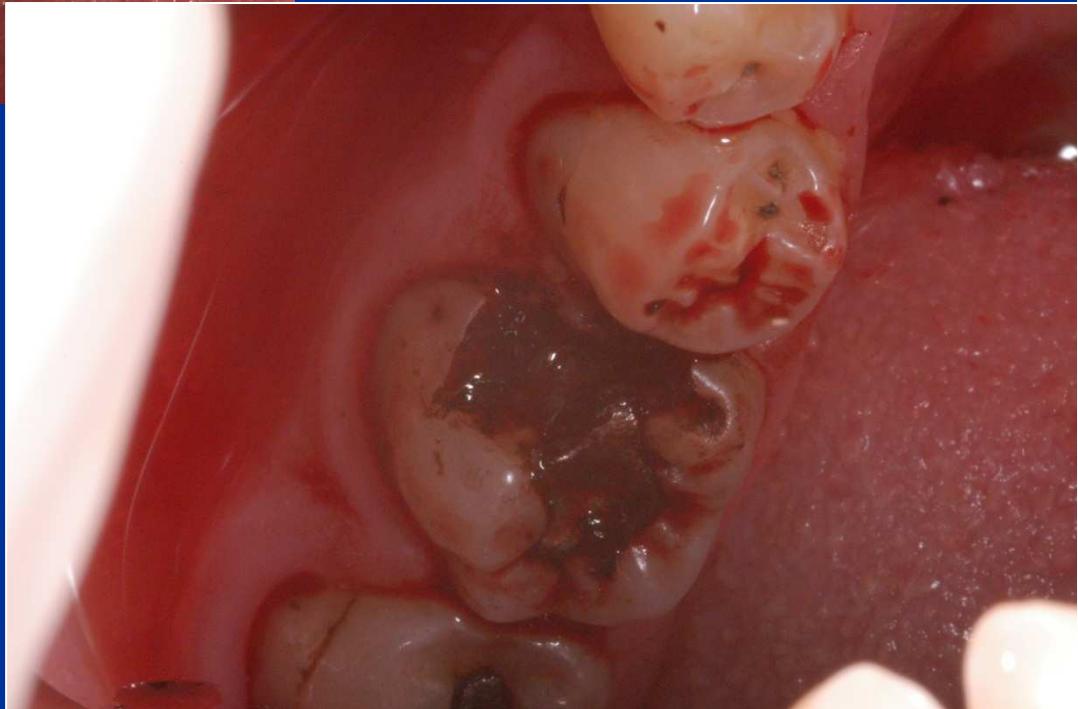

Access to the cavity

lroubal@med.muni.cz

- Skalpel
- Kauter
- Laser
- Temporary filling

Cavosurface margin

Proximal box:

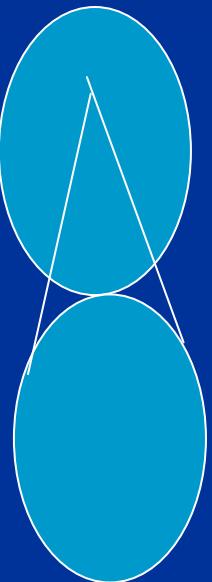

Axial wedges

Under the free gingiva

Occlusal

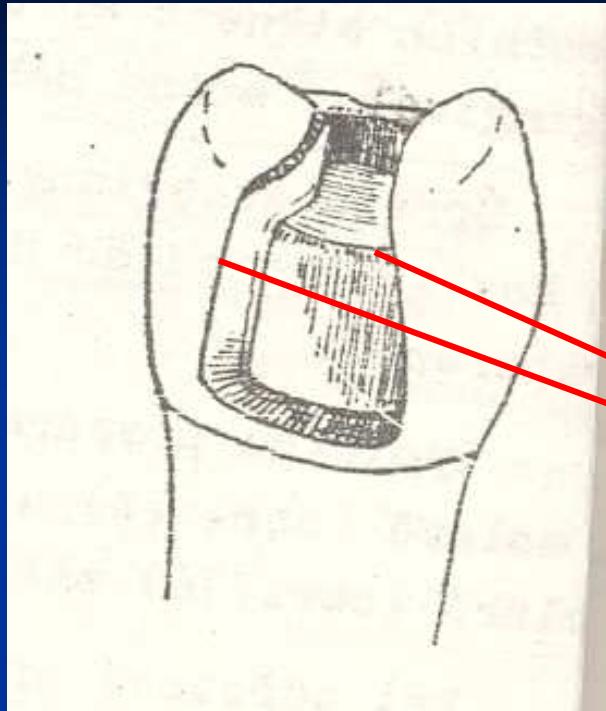

Class I. cavity preparation

American rule

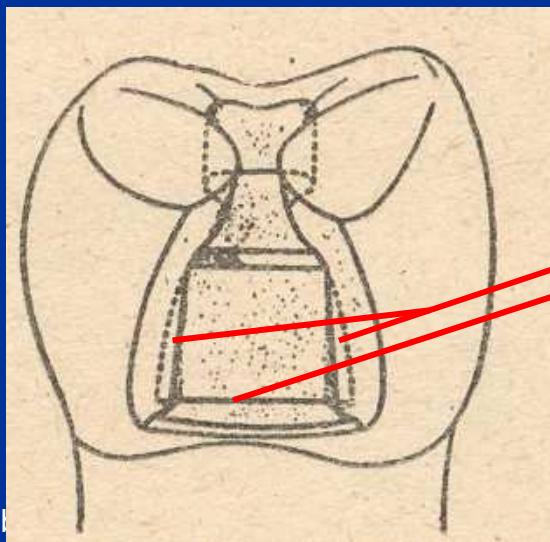

Retention

- Occlusal cavity – auxilliary cavity on occlusal surface
- Undercuts
- Grooves

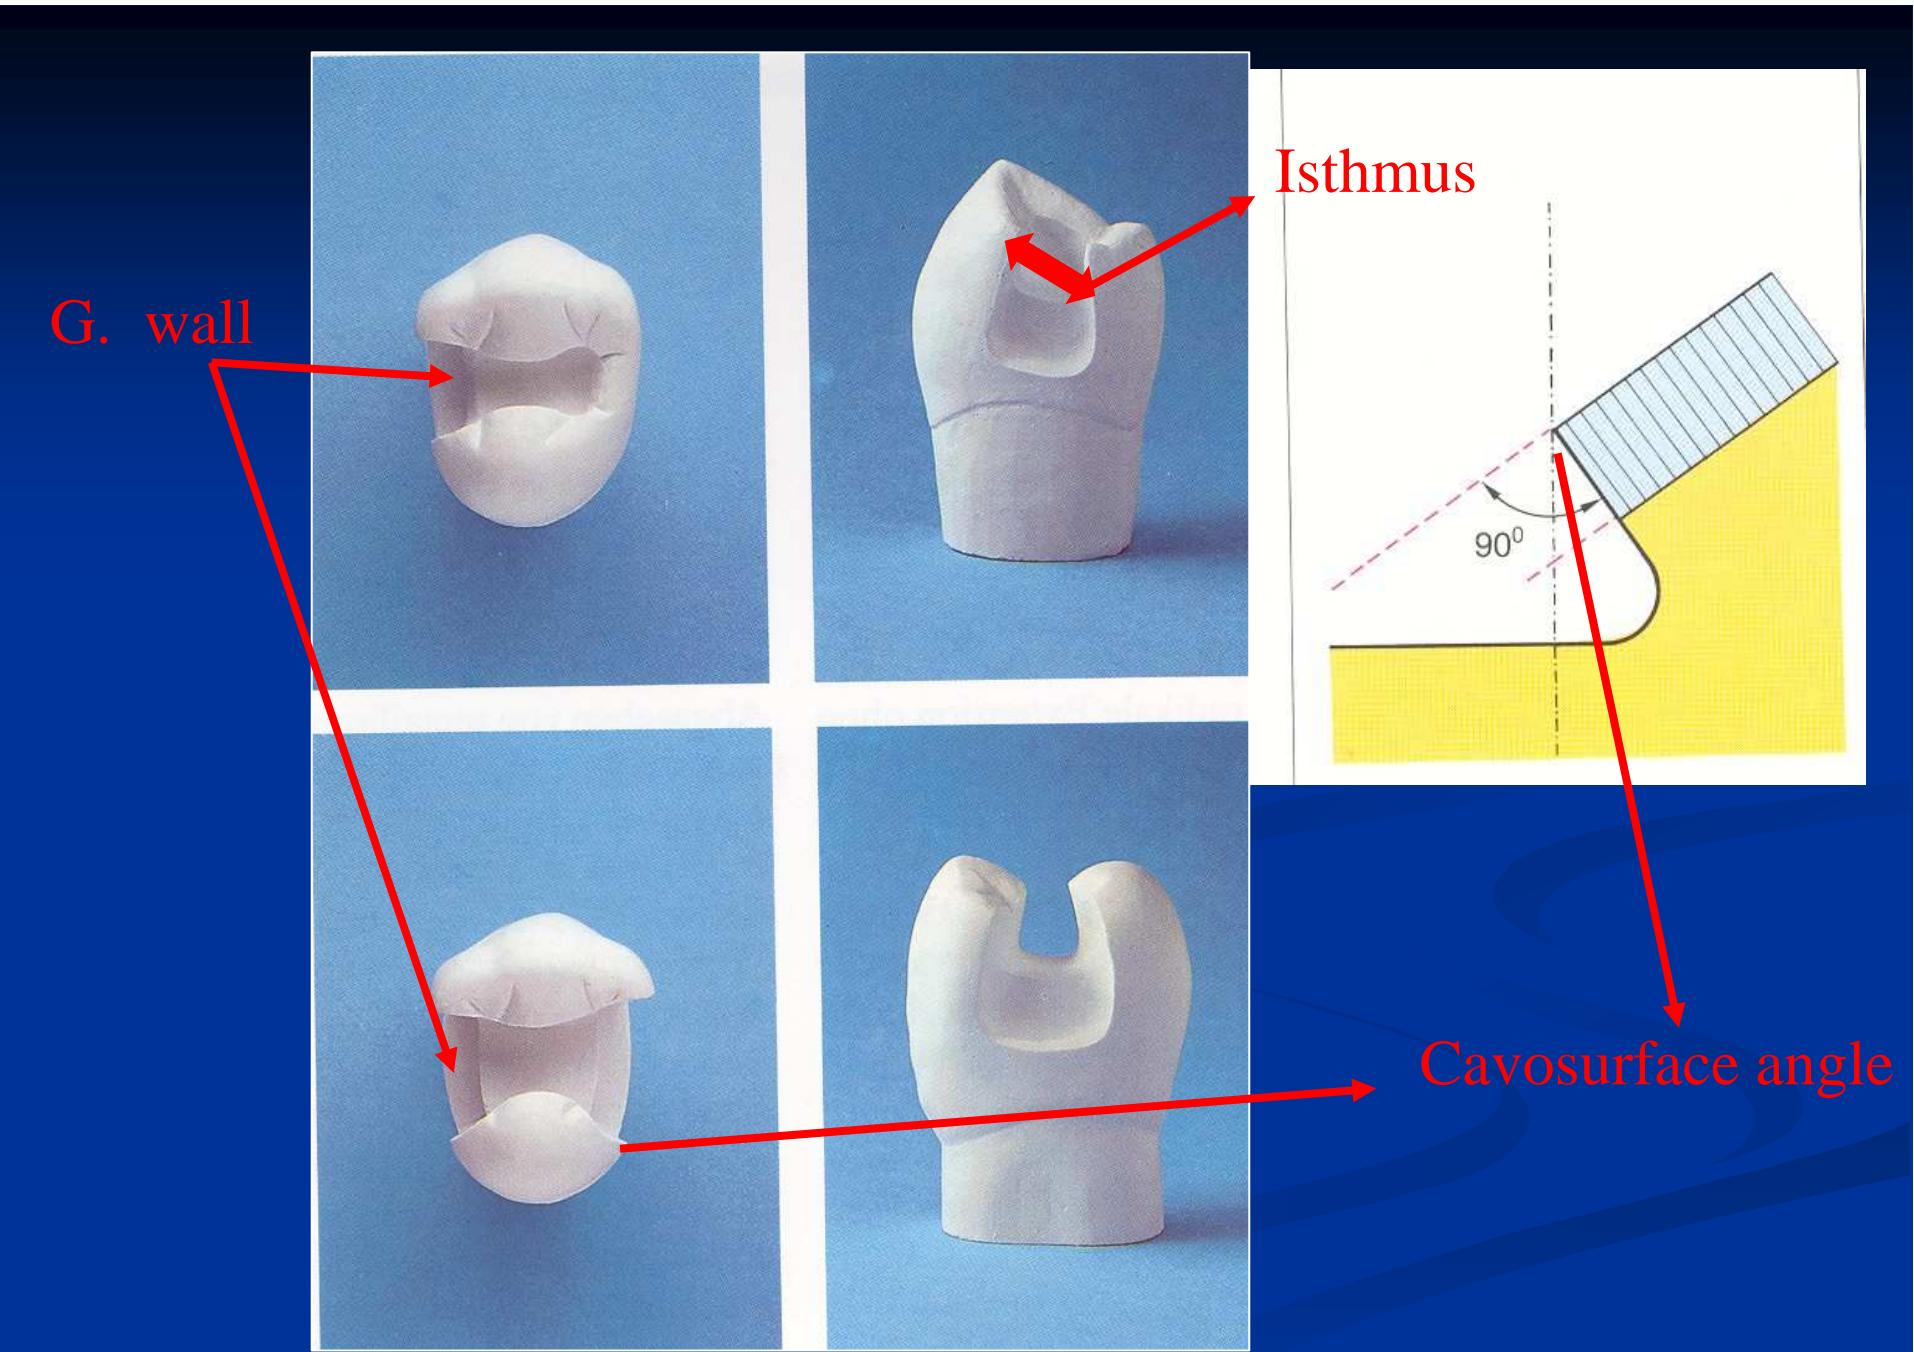

Axial walls
are divergent
in the gingival direction

Vertical and horizontal
grooves

Resistance

- No undermined enamel
- No sharp wedges
- Isthmus is $1/3 - 1/4$ intercuspal distance
- Angle between axial and gingival wall: 90° , or 85°
- Width of gingival wall is 1 mm at least
- Thickness of the filling 2 – 4 mm (4mm cusp replacing)

Excavation of carious dentin

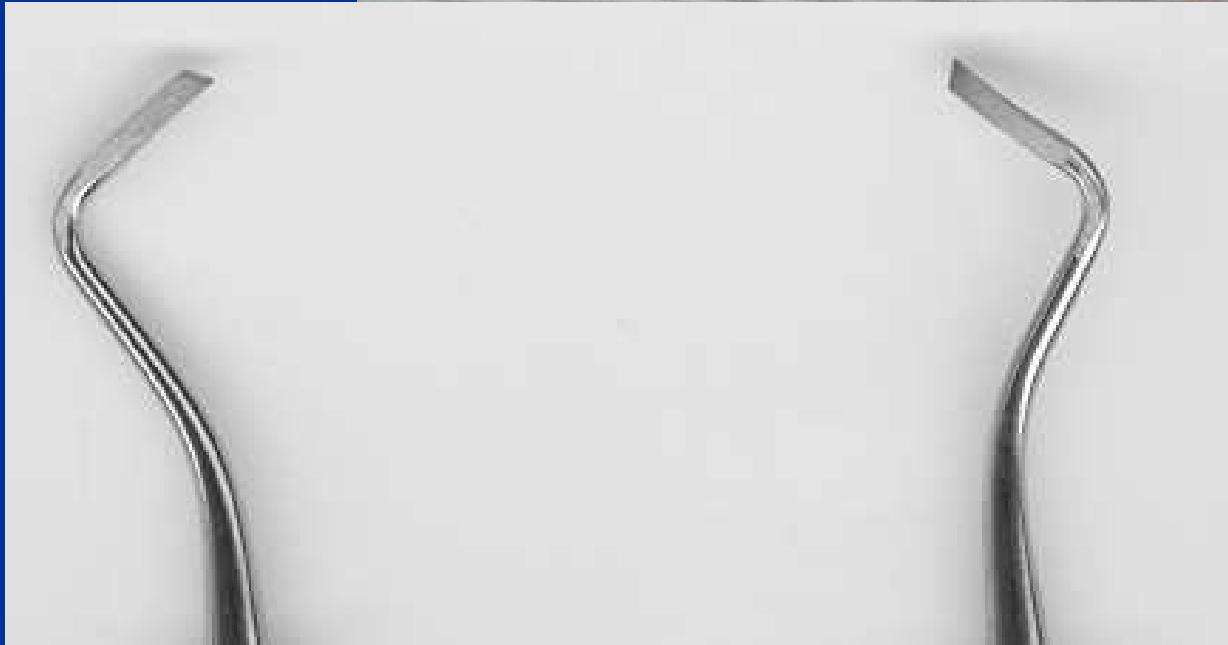

Round bur (ball) or excavator

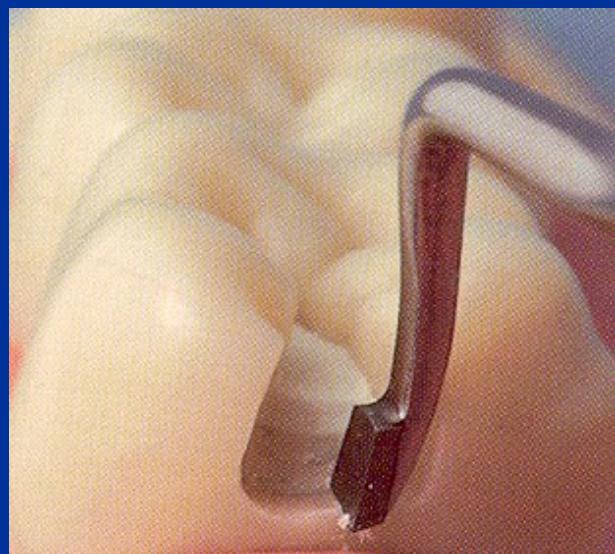

(Caries Detector, Kuraray,
Japonsko; Caries Marker,
VOCO, Německo)

Finishing of cavity walls

- Red coded diamond bur
- Chisel on the gingival wall (if in enamel)

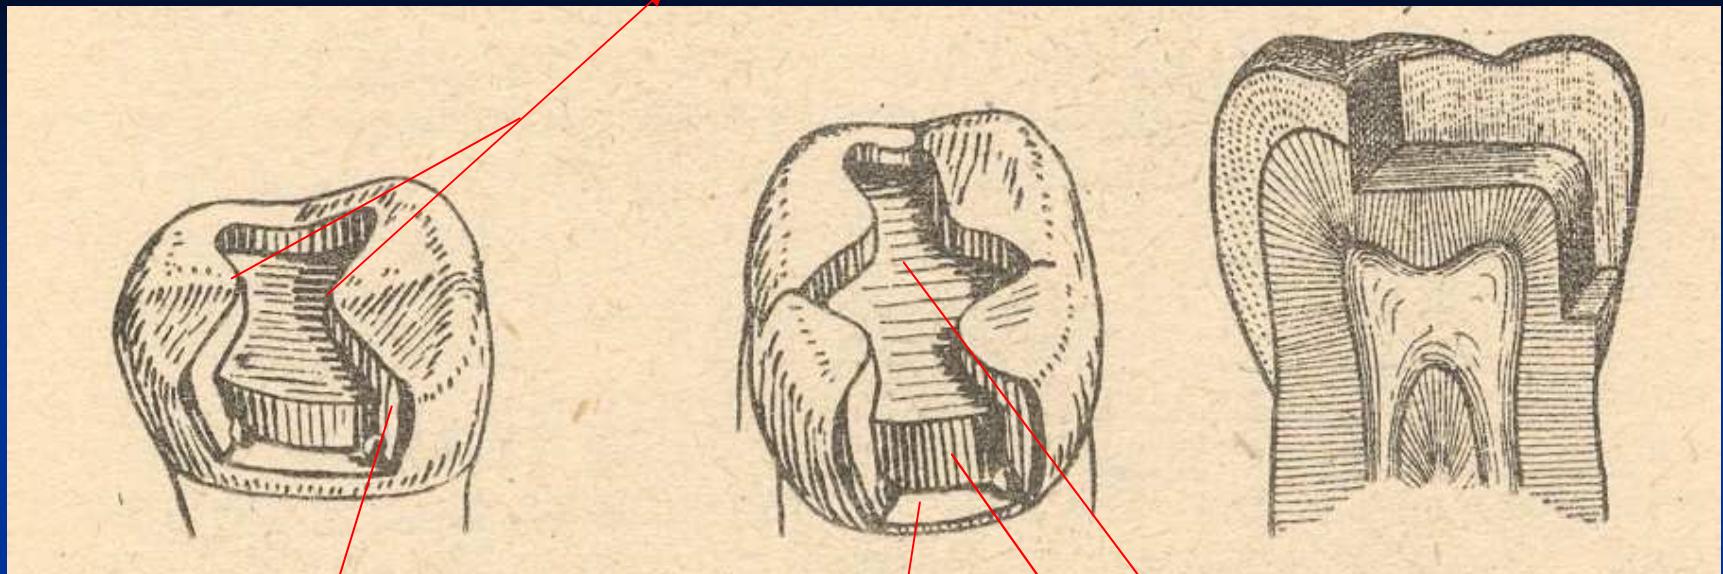

Cavity control

- Goog light, miror

Isthmus

Axial wall

Gingival wall

Pulpal wall

Matrix placement

- Matrix primarily is used when a proximal surface is to be restored

The objectives:

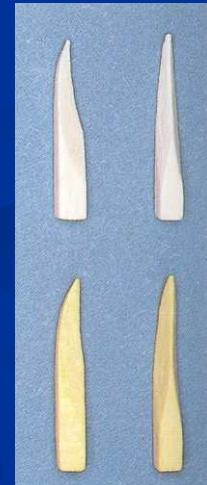

- Provide proper contact
- Provide proper contour
- Confine the restorative material
- Reduce the amount of excess material

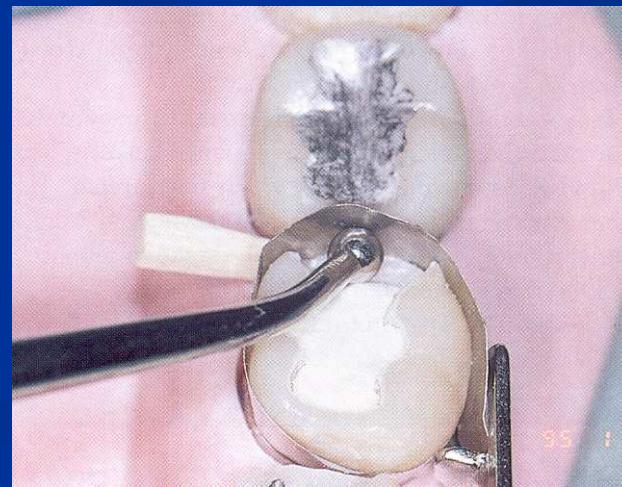

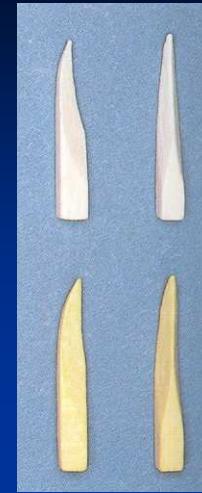

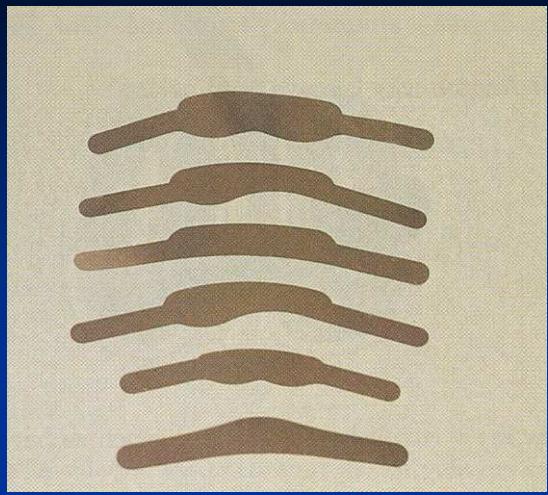

Matrices – matrix band, matrix retainer

- Ivory I retainer Ivory 1
- Hawe Neos retainer Ivory 8
- Tofelmire matix and retainer

Wedges

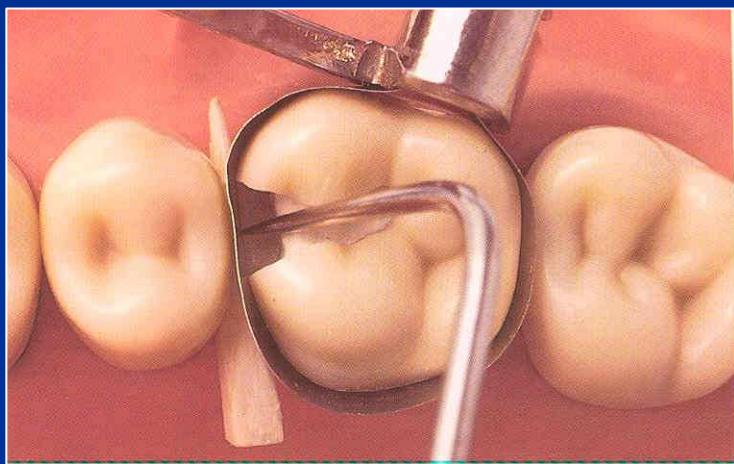

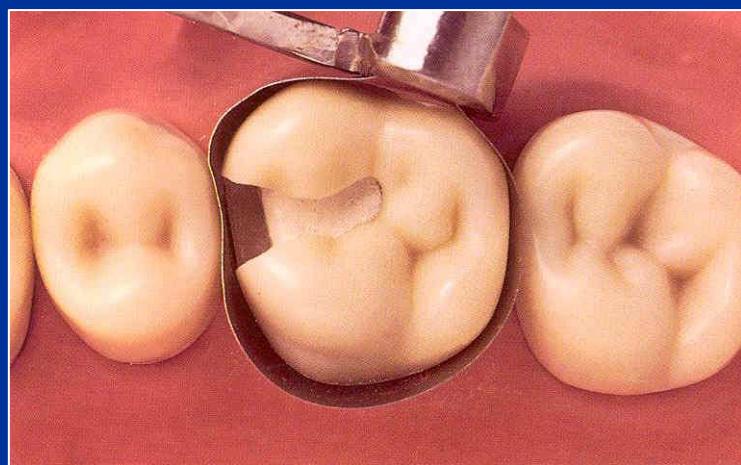

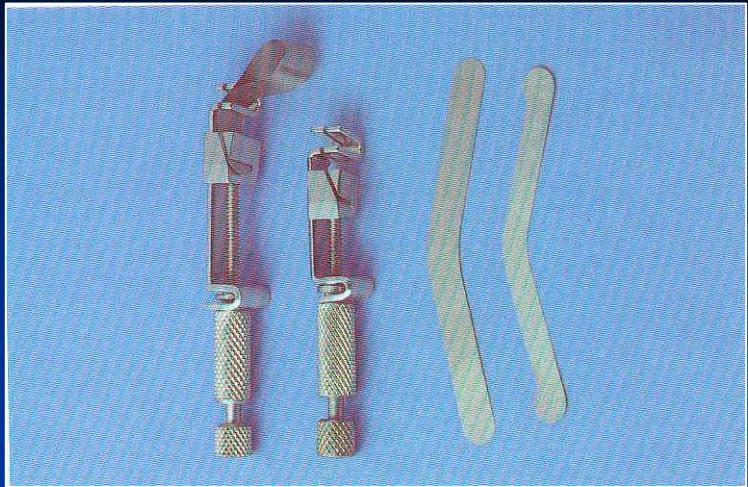

- Wooden wedges
 - tighten the matrix band
 - do the compression of the gingiva
 - separate the teeth

Wedging

- Slip the matrix band over the tooth (apical to the gingival margin – 0,5, - 1 mm)
- Tighten the matrix, check it with probe
- Place a wedge
- Turn the retainer $\frac{1}{4}$ counterclockwise
- Contour the band

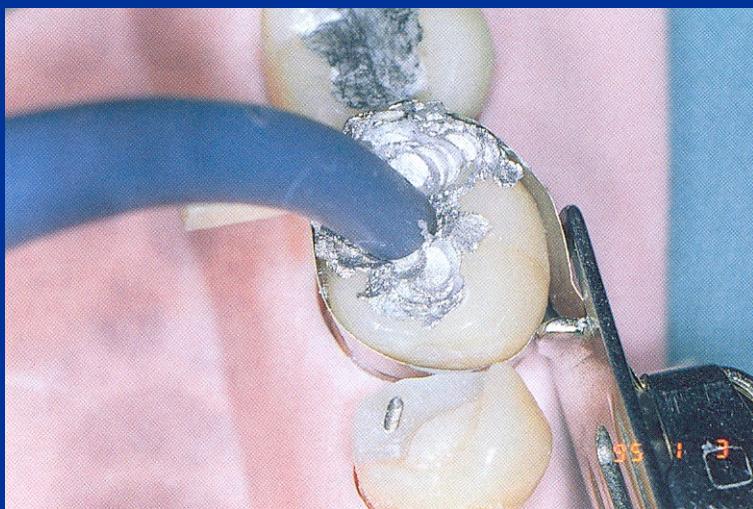

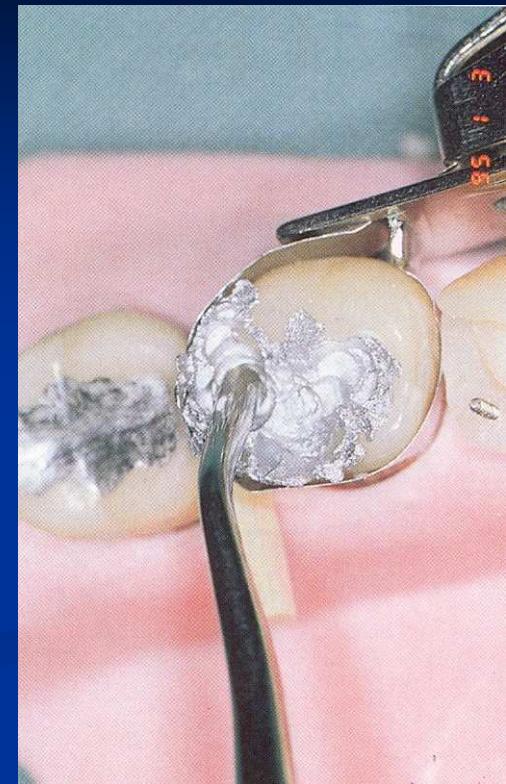

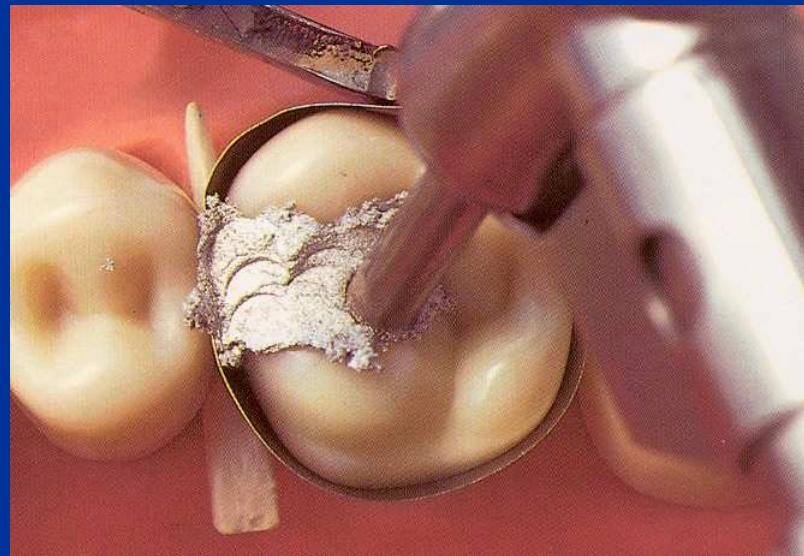

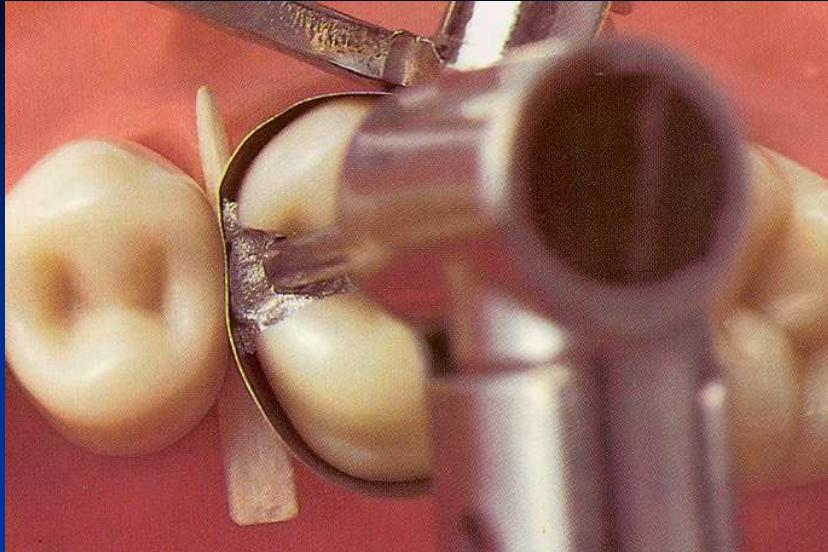

Trituration!

Condensation of amalgam

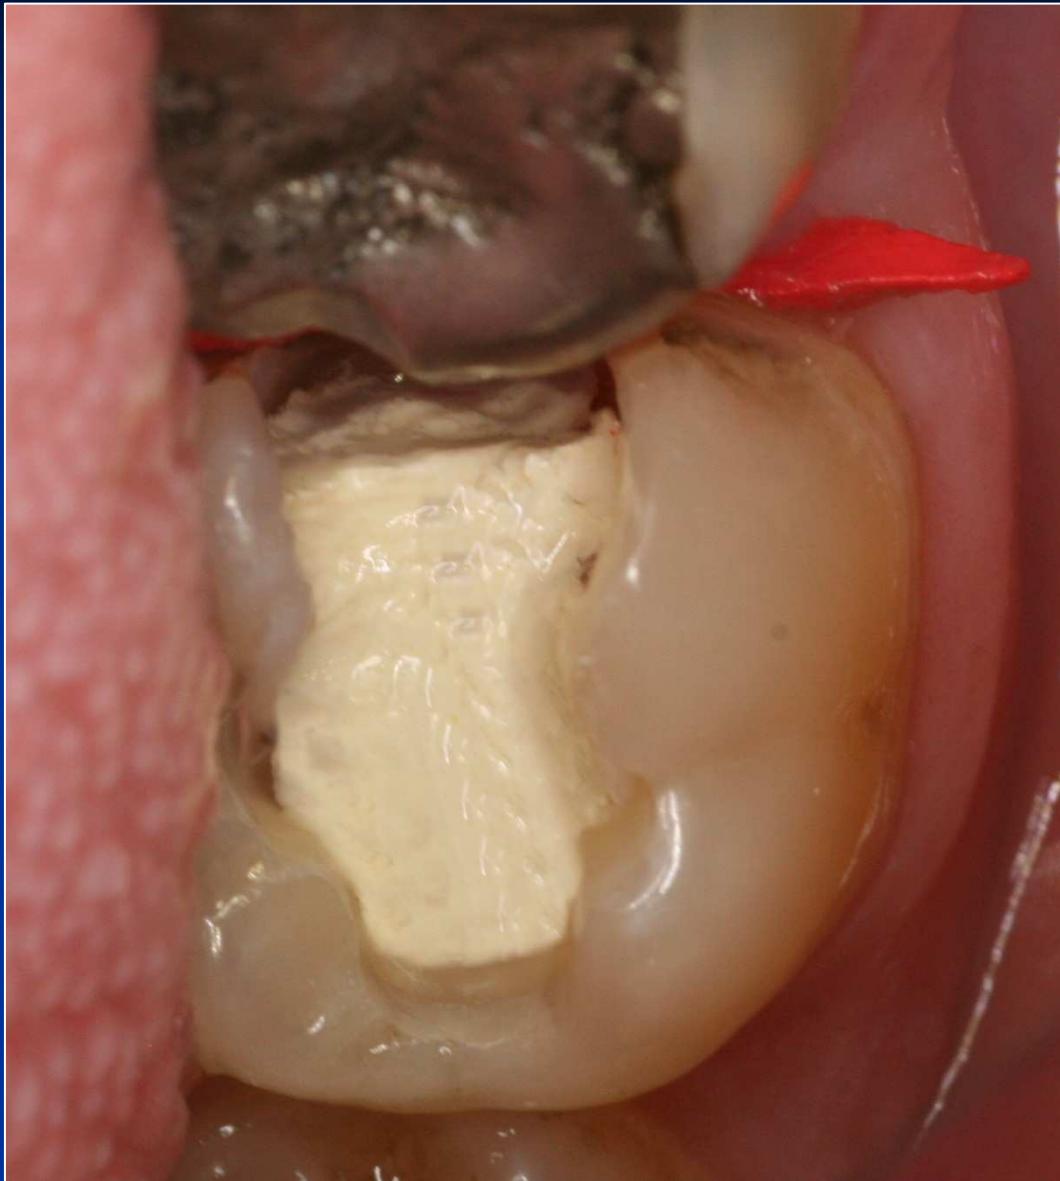

- Condensor – straight front
- Power driven condensation

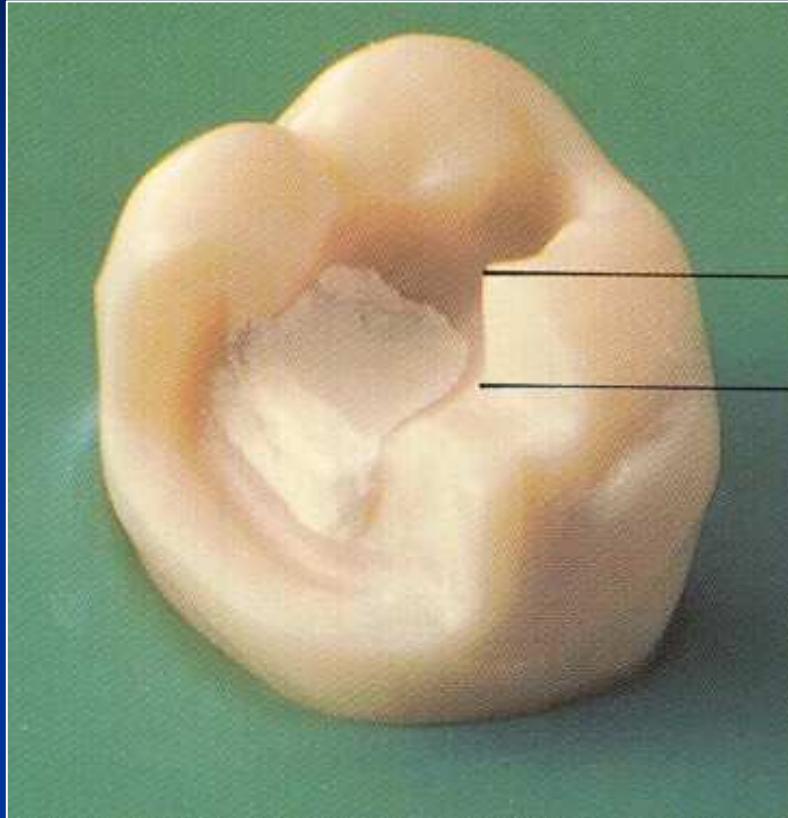

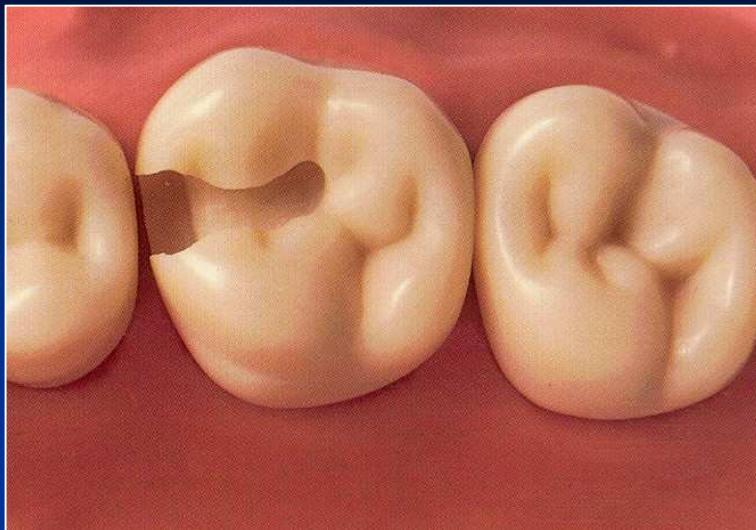

Base

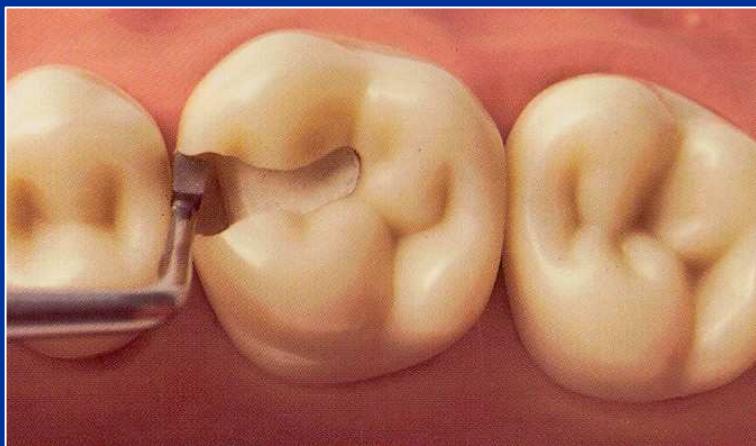

- Zinkoxidphosphate cement

On pulpal walls only!

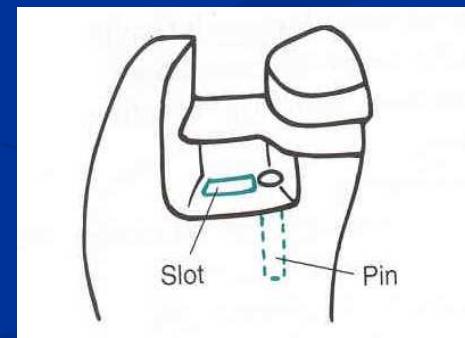

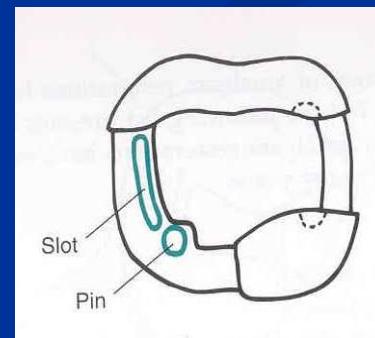

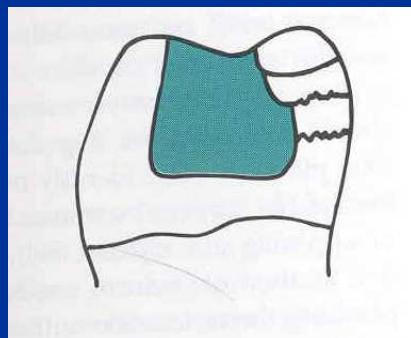

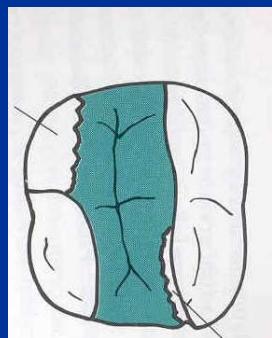

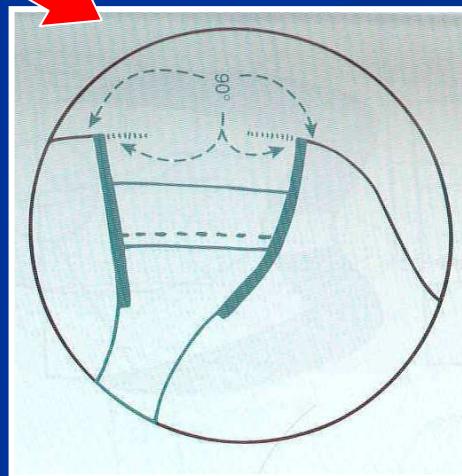

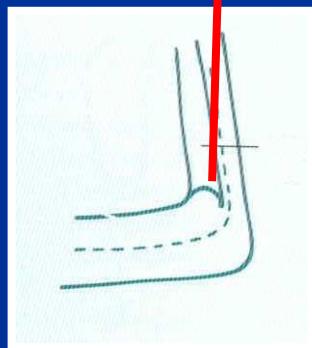

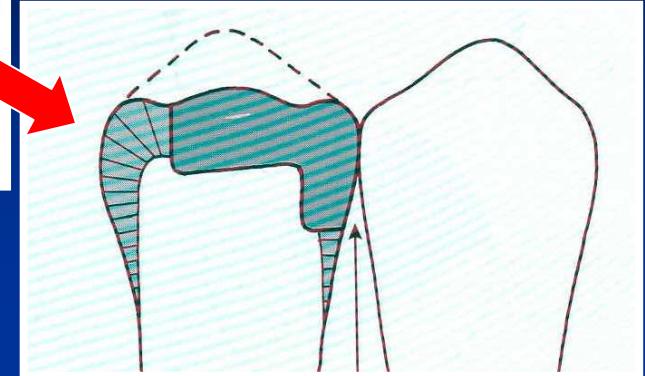

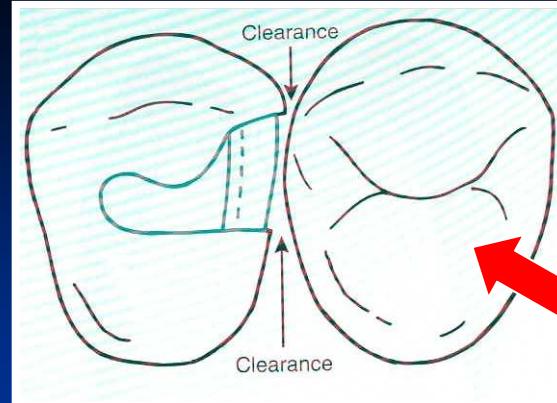

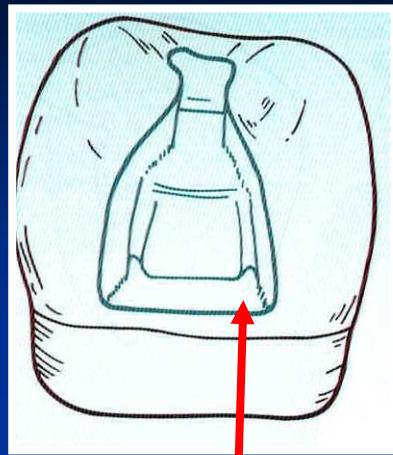

The base must be hardened

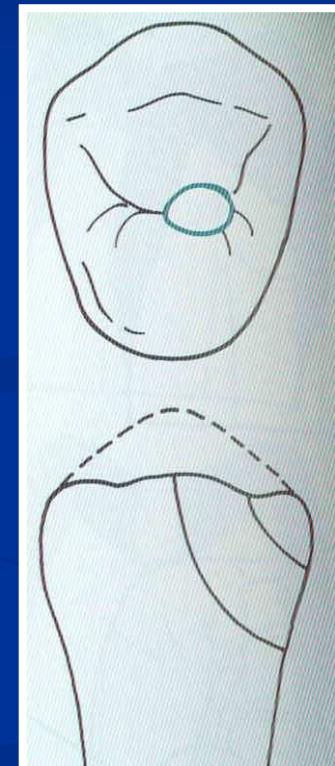

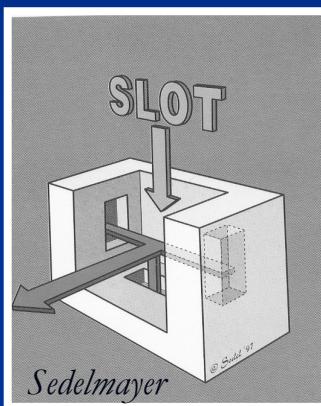

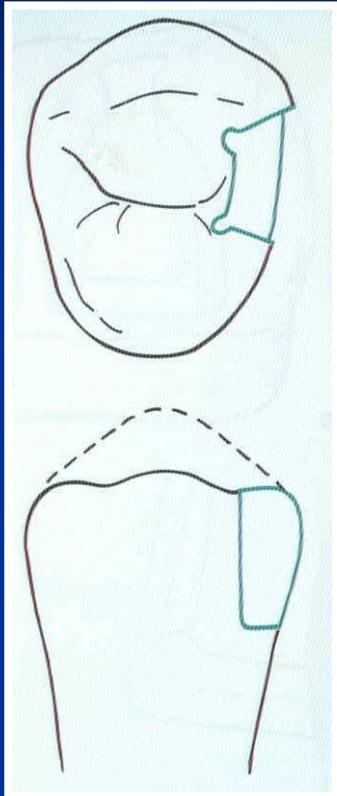

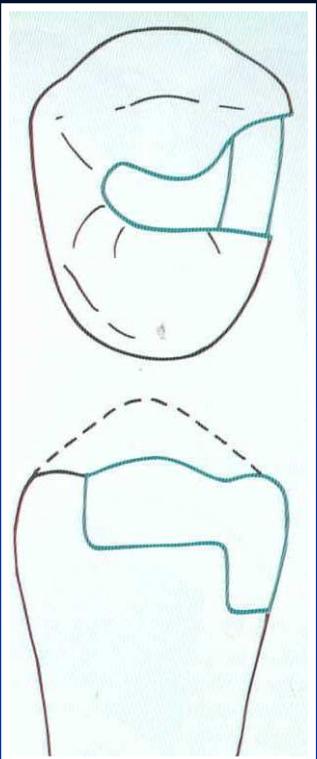

Amalgam

Retention

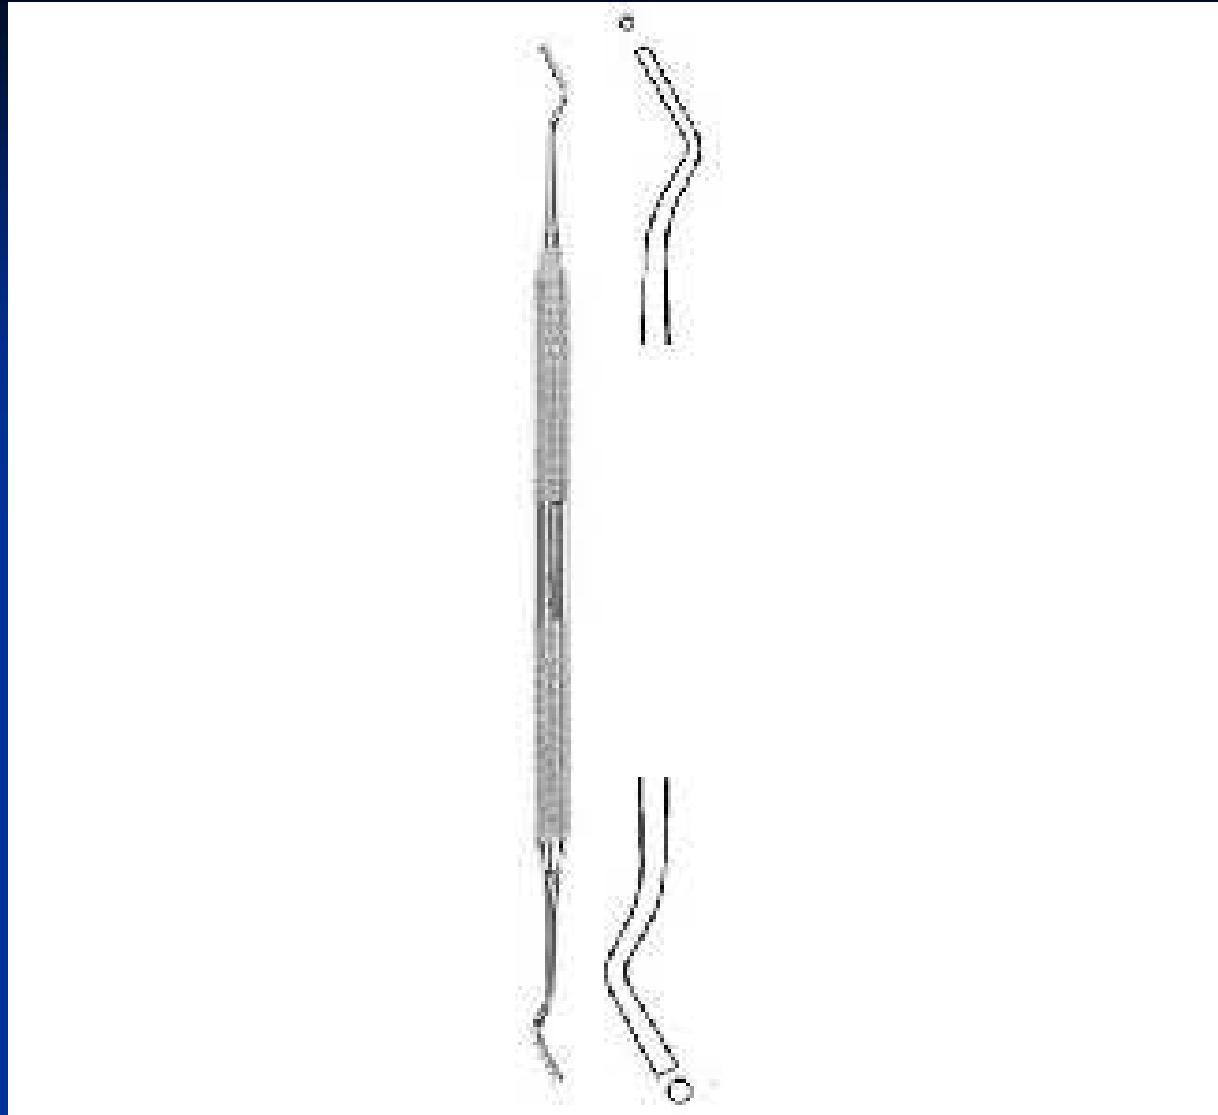

Instruments

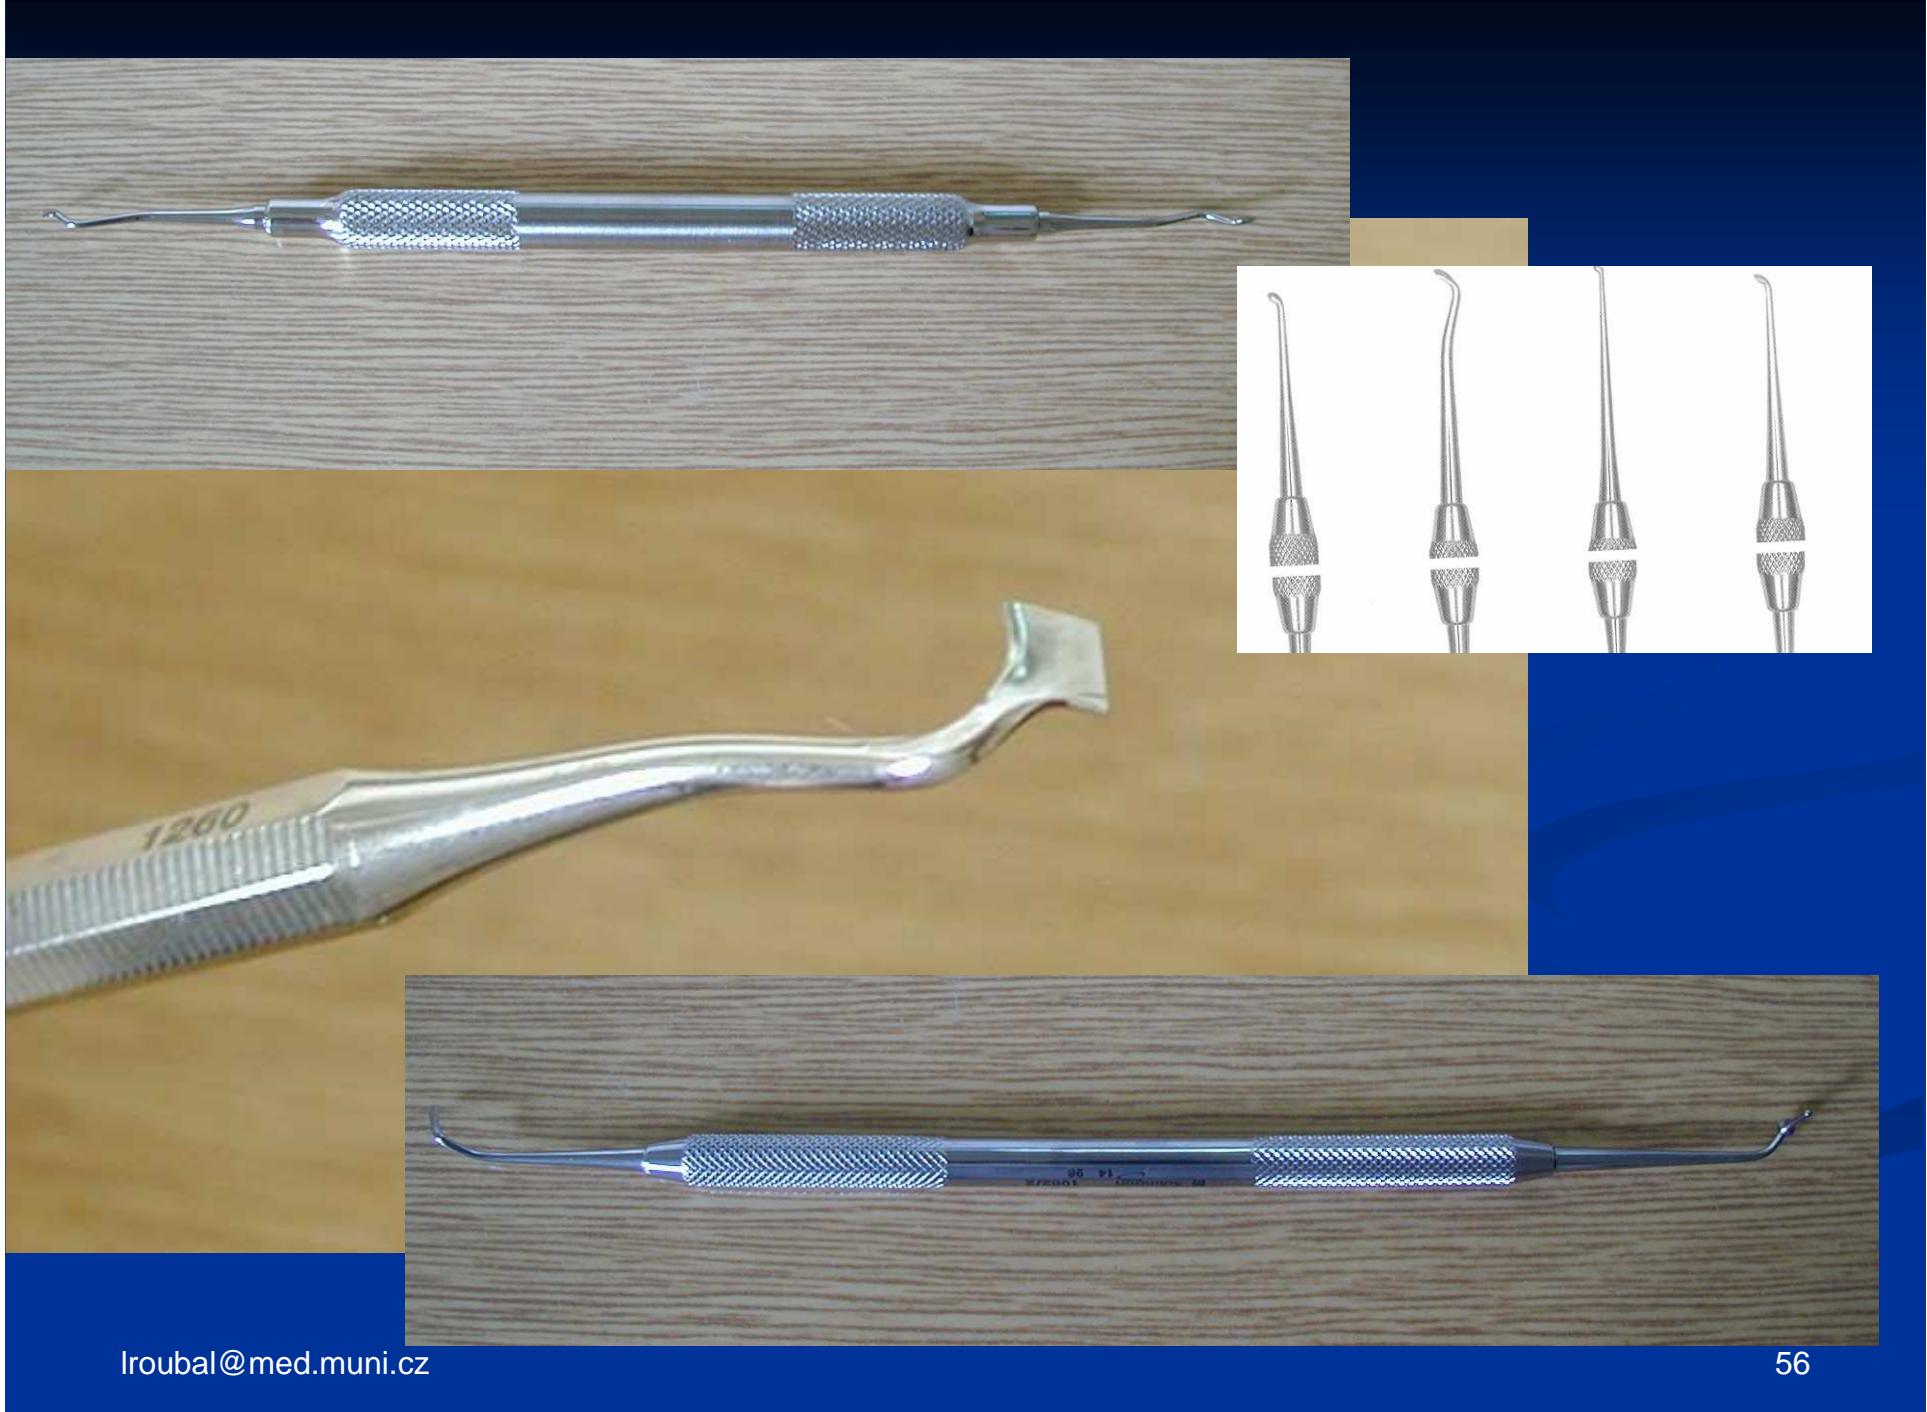

- Preparation
- Filling
- Finishing and polishing
