

Class II. acc. to Black

Defects affecting one or both proximal surfaces of posterior teeth.

Morphology of proximal space

Contact point – area

The space below
(filled of interdental papilla,
the level of the papilla is decreasing
during the time)

The space above (habitually clean place)

Symptoms

- No symptoms
- Increased sensitivity (cold, sweet)
- Retention of food
- Defect (cariious lesion is open – the enamel is broken)
- Bite sensitivity (when cariious lesion is open)

Diagnosis

- Visual changes of tooth structure

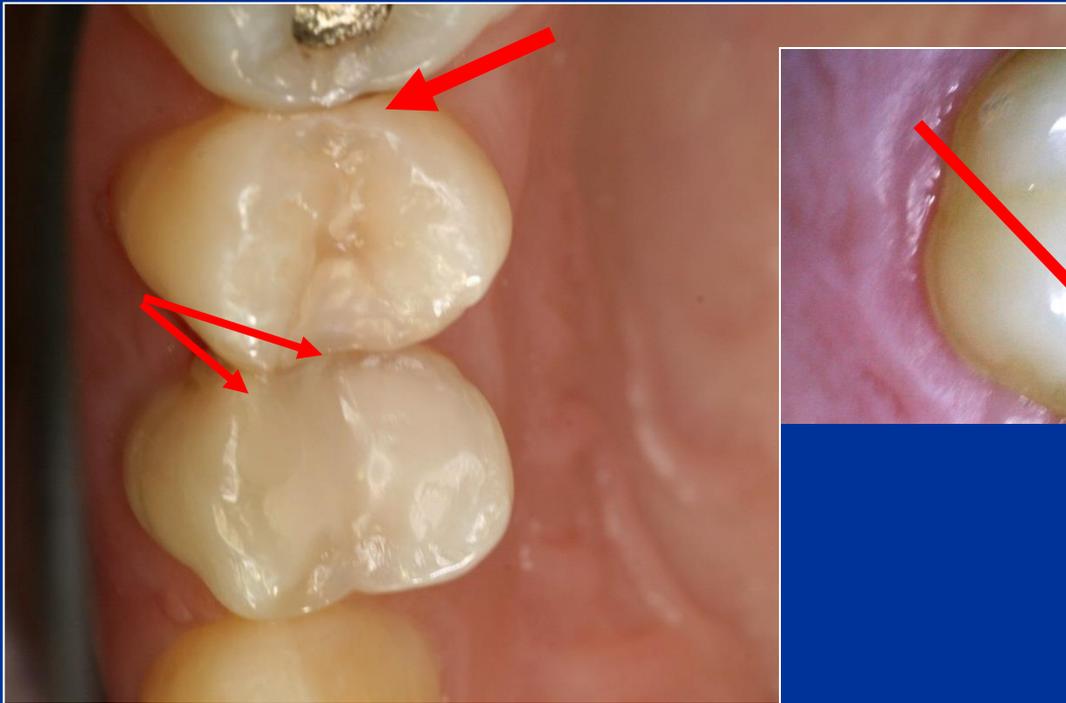

Inspection, good illumination, magnification

- Imaging methods

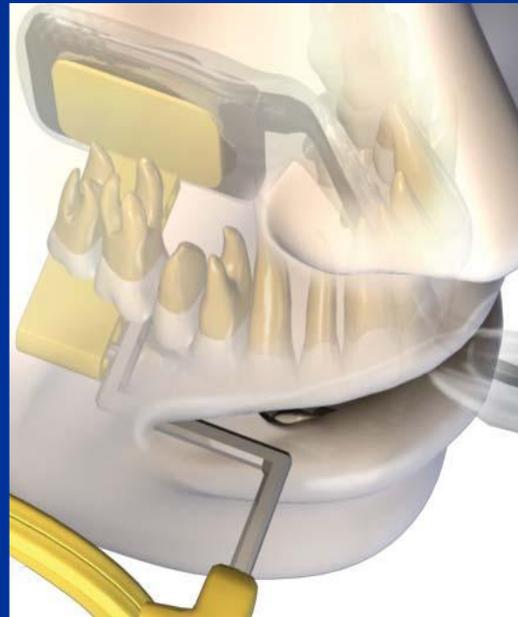

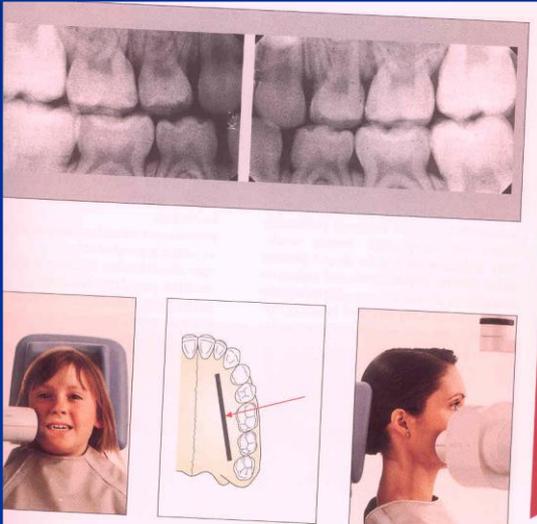

X ray - radiography

Transillumination (DIFOTI)

Radiography

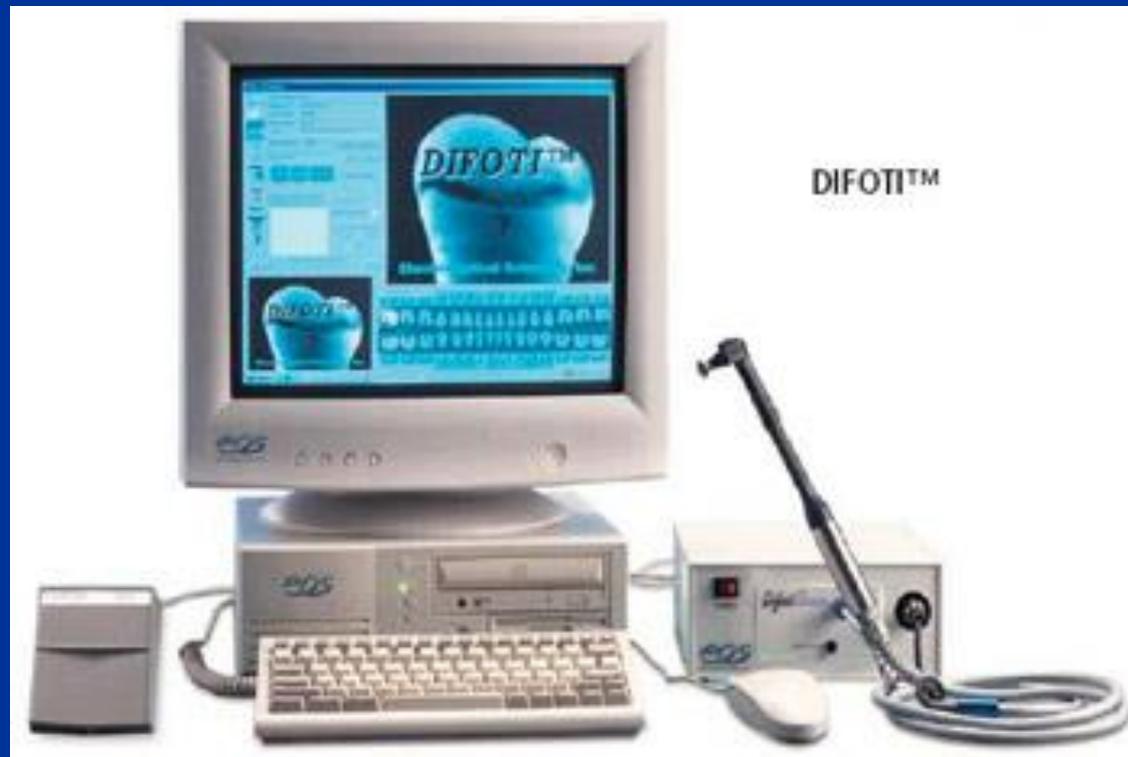

Bite wing

DIFOTI

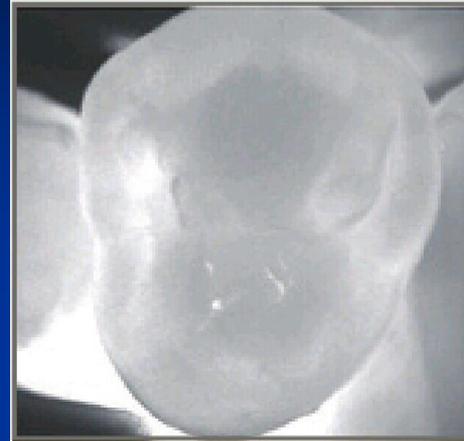

(**D**igital **F**ibre **O**ptic
Trans-**I**llumination)

- Digitální forma FOTI – zdroj bílého světla – kamera s CCD senzorem – počítač – zobrazení jako obrázek

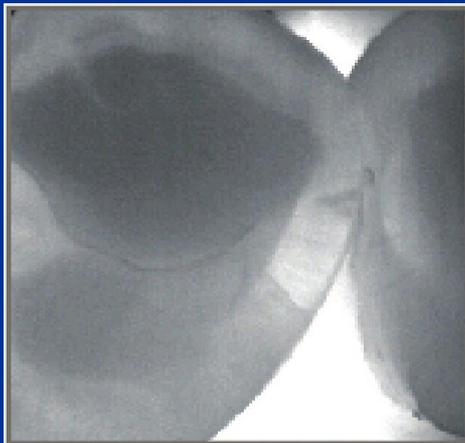

DIAGNOCam-

- 0 – no caries

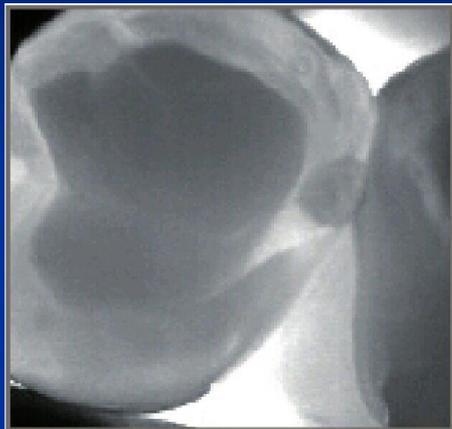

- 1-first visible changes

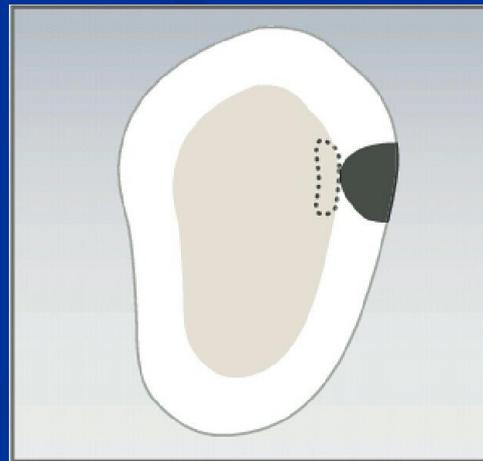

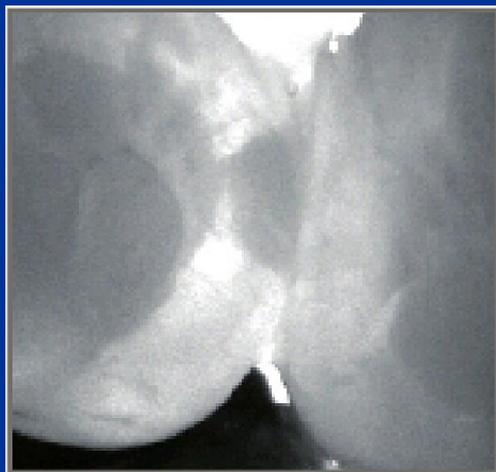

DIAGNOCam

- 2-caries in enamel

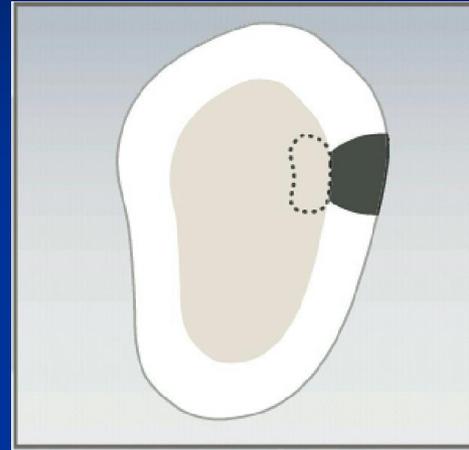

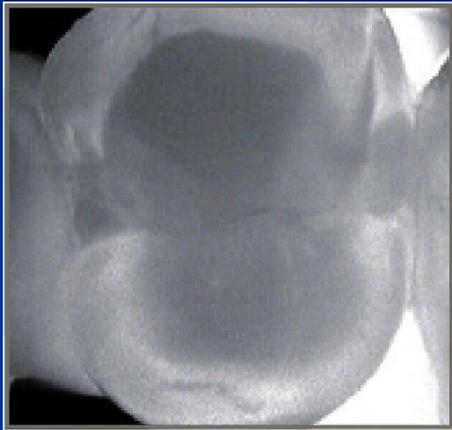

- 3 caries on dentino - enamel junction

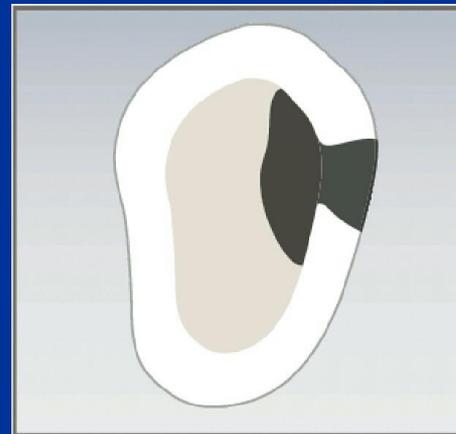

DIAGNOCam

- 4 – caries in dentin next to enamel

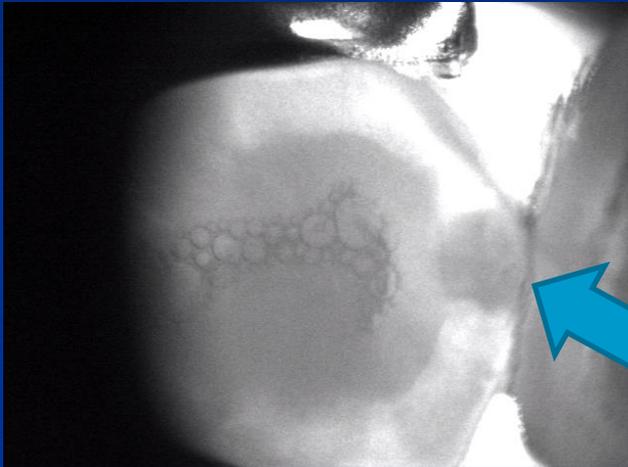

- 5 – large caries in dentin

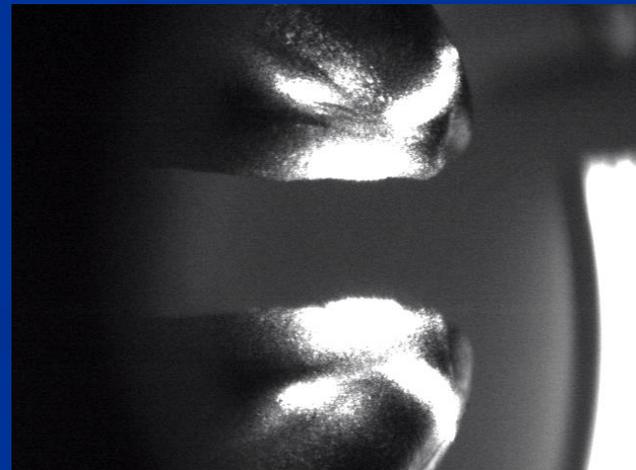

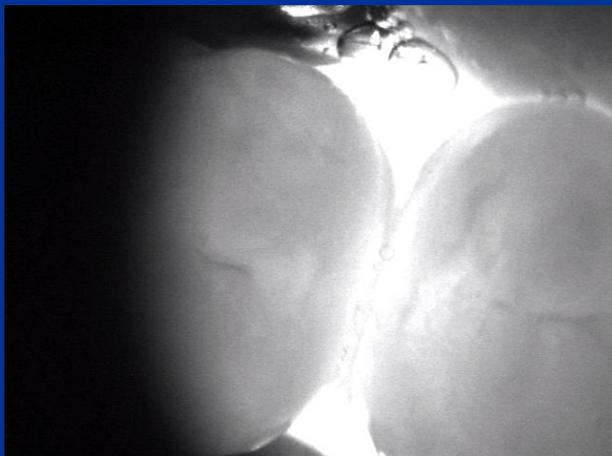

DIAGNOCam

- Nálež kazu

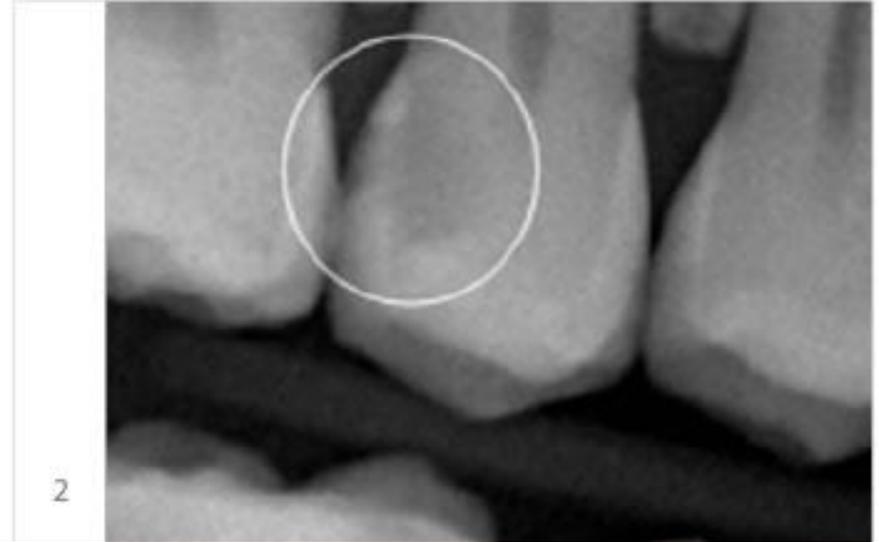

- ???

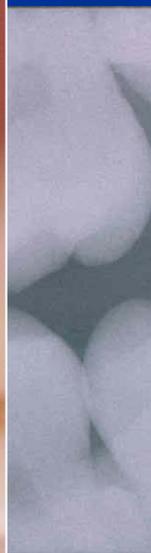

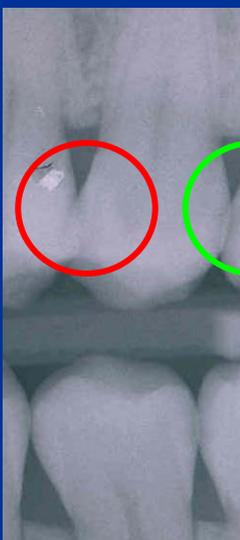

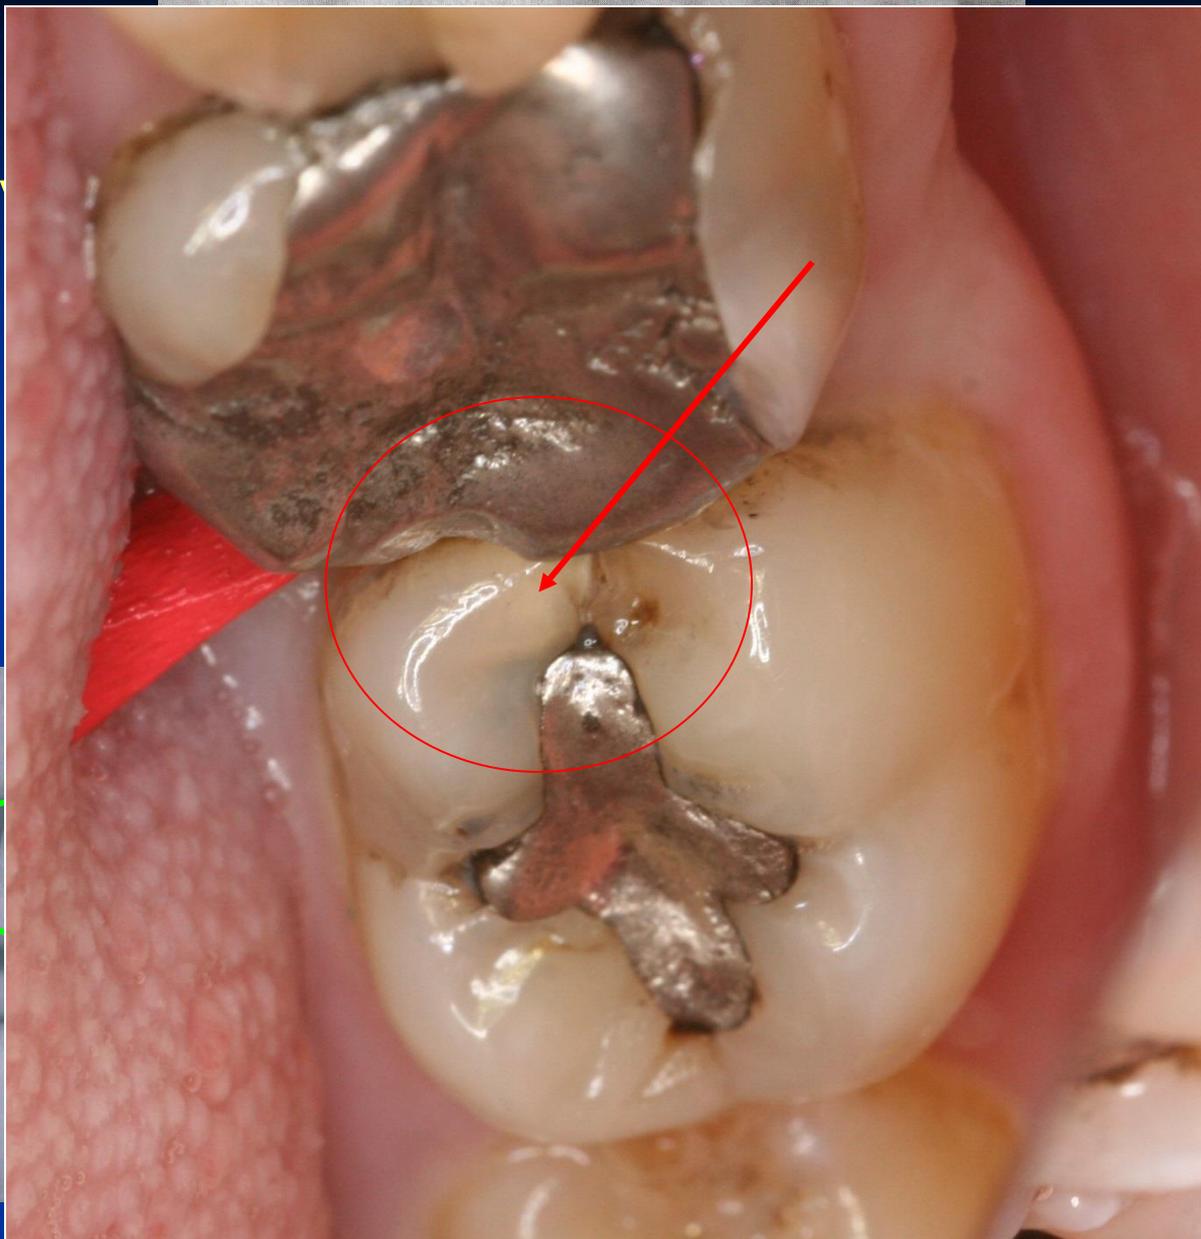

Diagnocam

Bitewing

4 stupňo
grading

KTG vyšetření – Bite wing

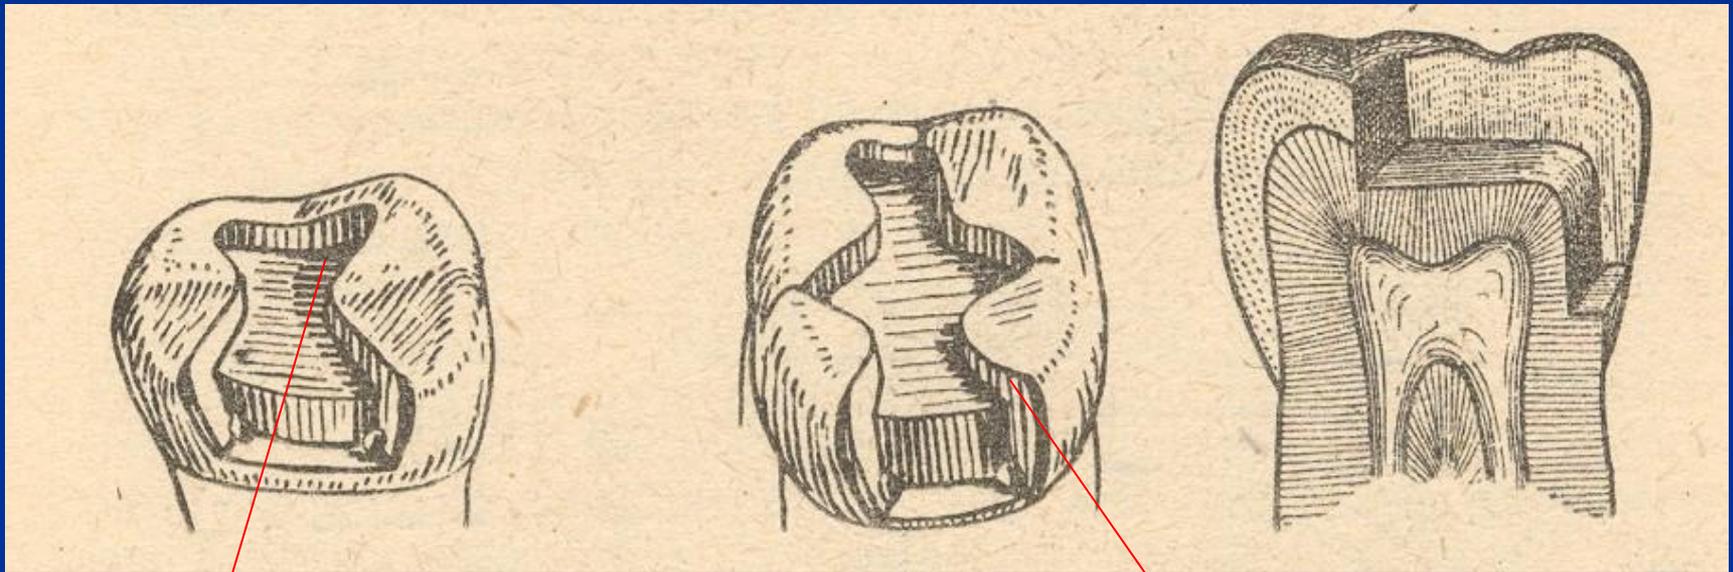

Preparation - amalgam

- Conventional preparation acc. to the Black's rules
- Slot preparation
- Large preparation – cusp(s) involved

Preparation - adhesive materials

- Conventional preparation for composites
- Adhesive slot
- Tunnel preparation

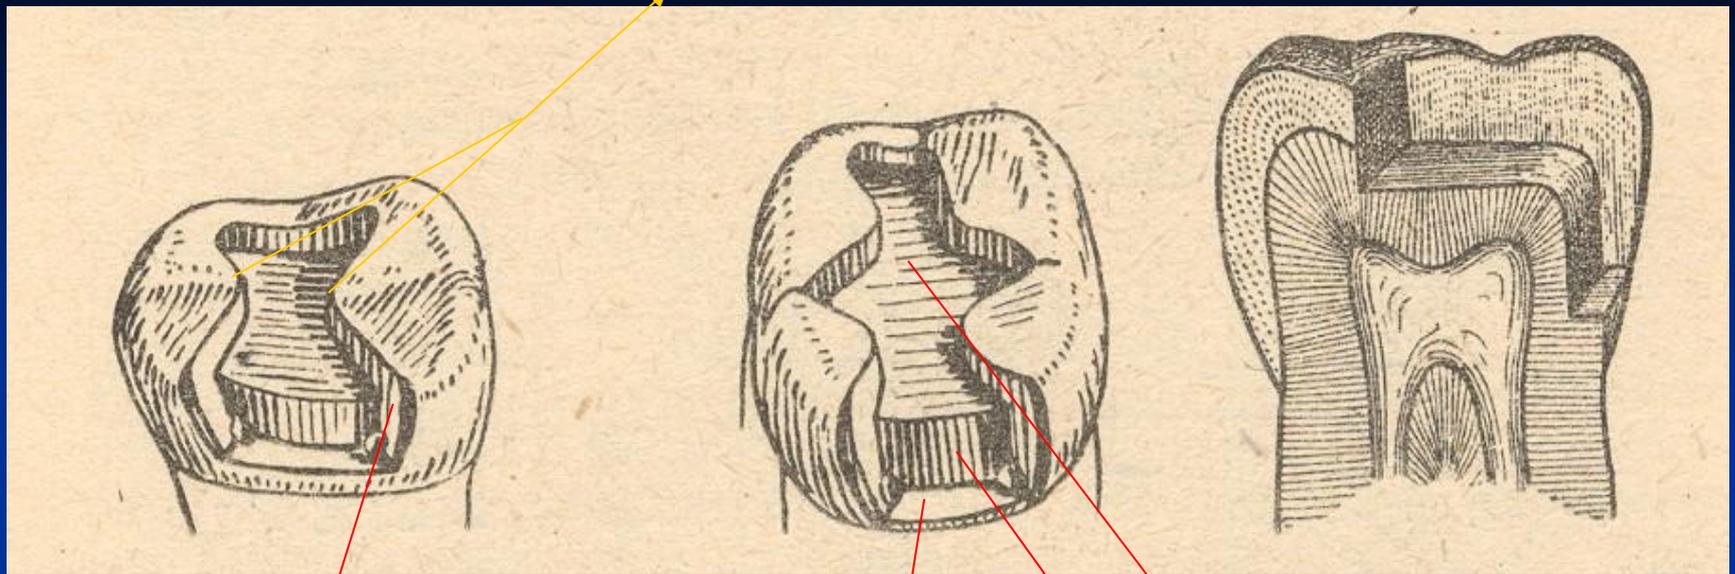

Conventional preparation

Occlusal cavity

Proximal cavity - box

Isthmus

Axial wall

Pulpal walls

Gingival wall

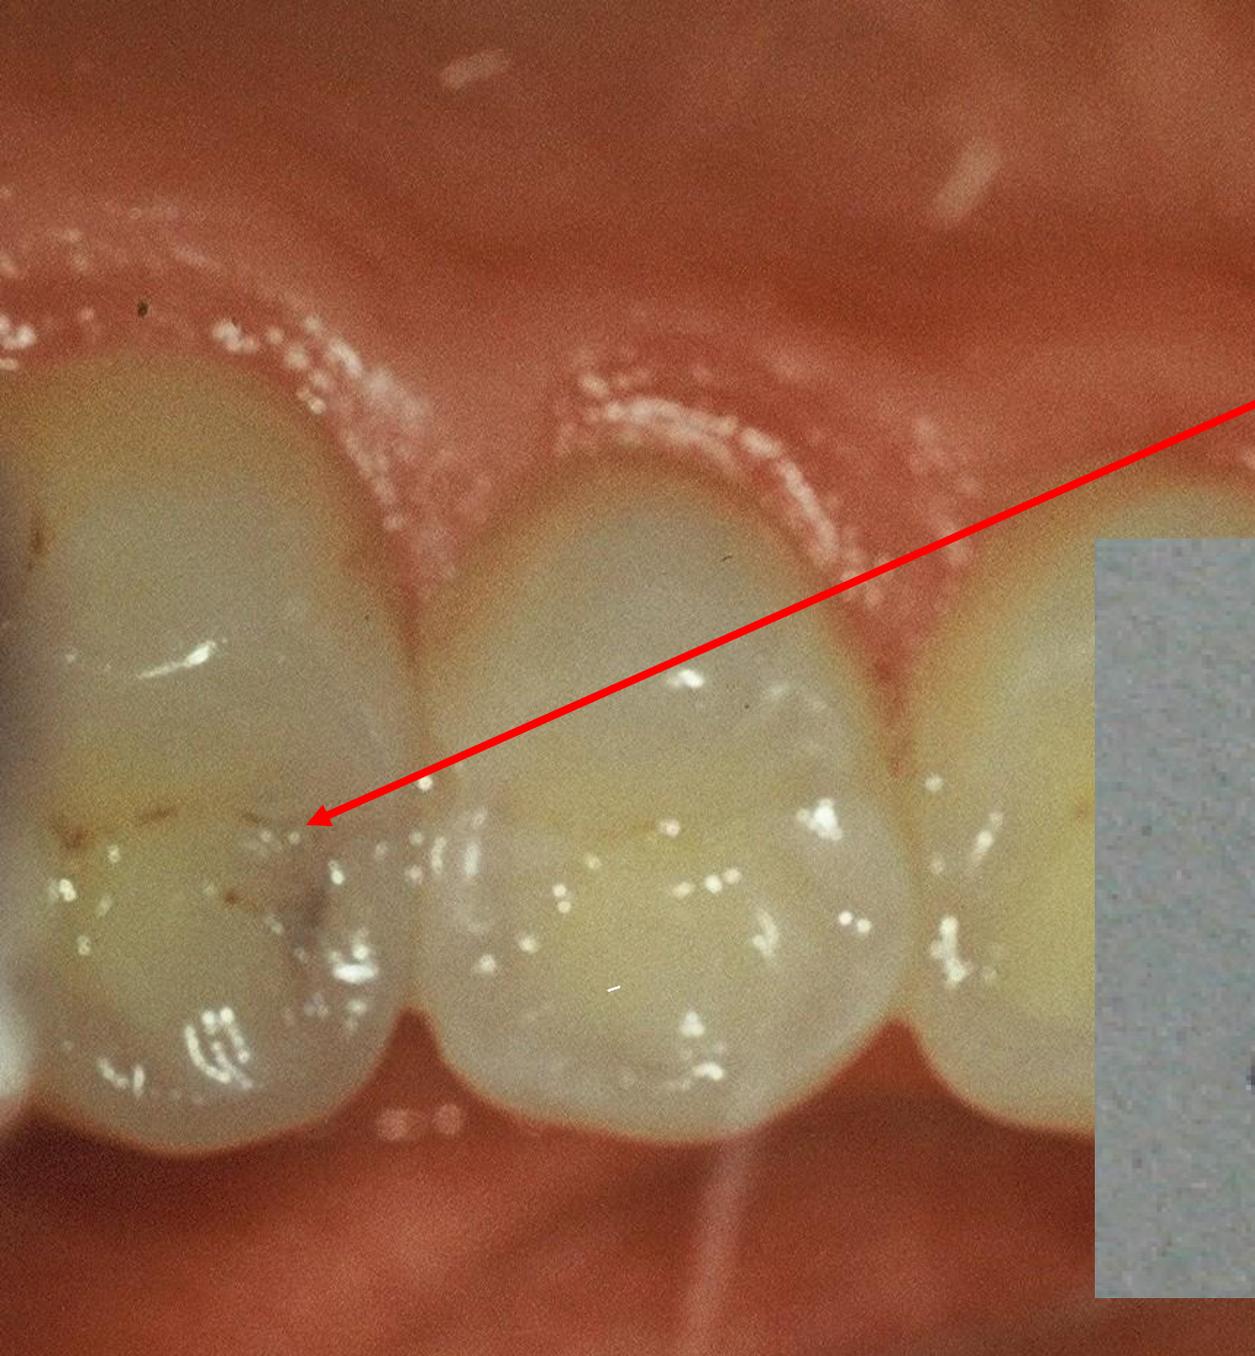

Access to the cavity

From the occlusal surface

Through the undermined enamel

Separation using wooden wedges is useful

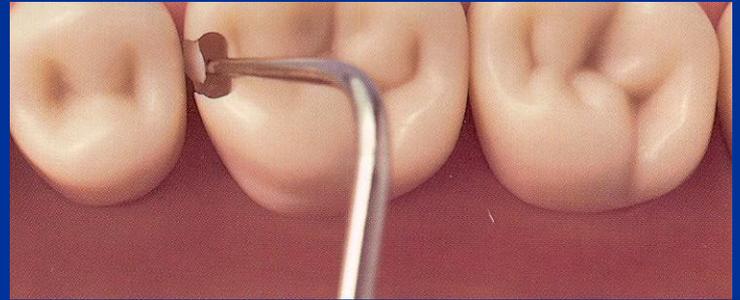

Pre op

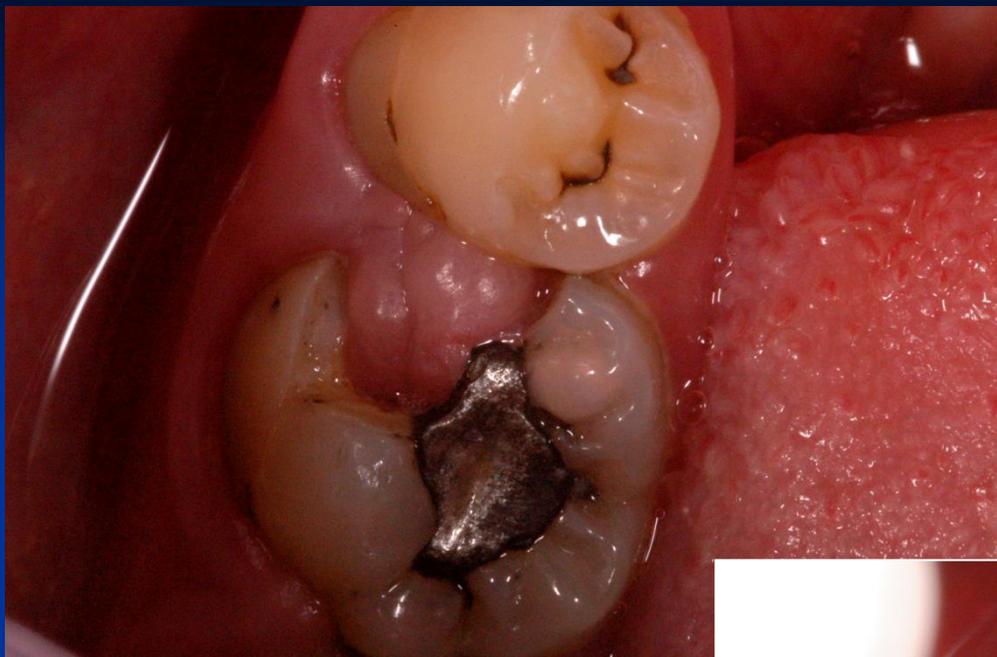

Access to the cavity

lroubal@med.muni.cz

- Skalpel
- Kauter
- Laser
- Temporary filling

Cavosurface margin and extention for prevention

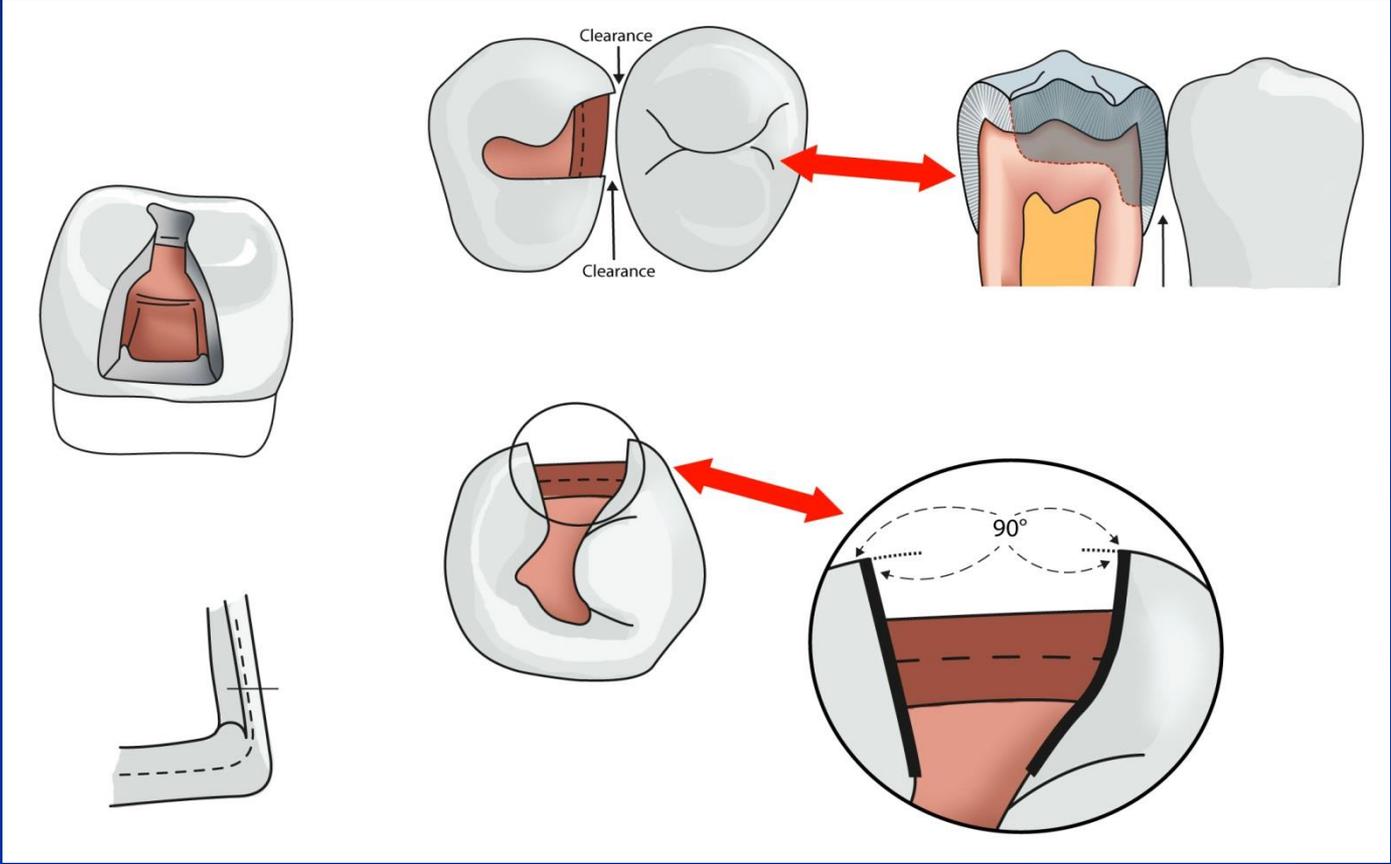

Proximal box:

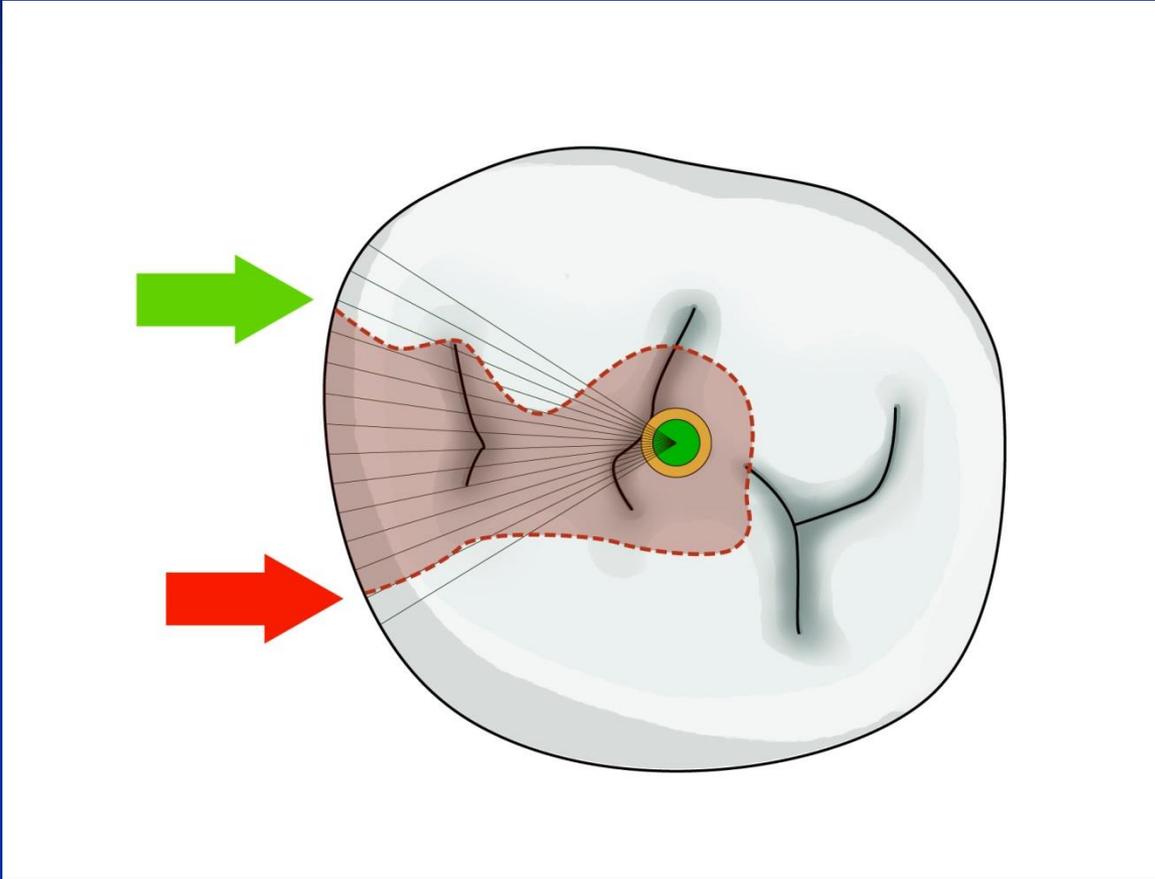

Axial walls

Gingival wall

Occlusally

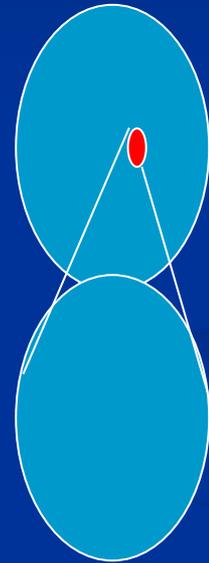

Class I.

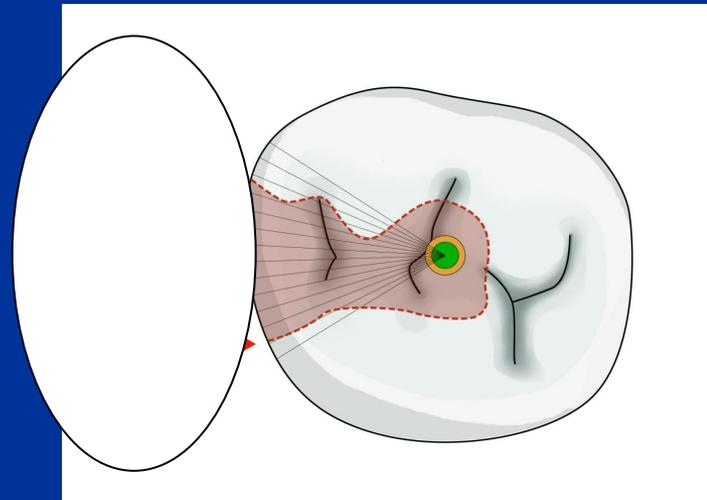

Cavosurface margin – axial walls

American rule obsolete

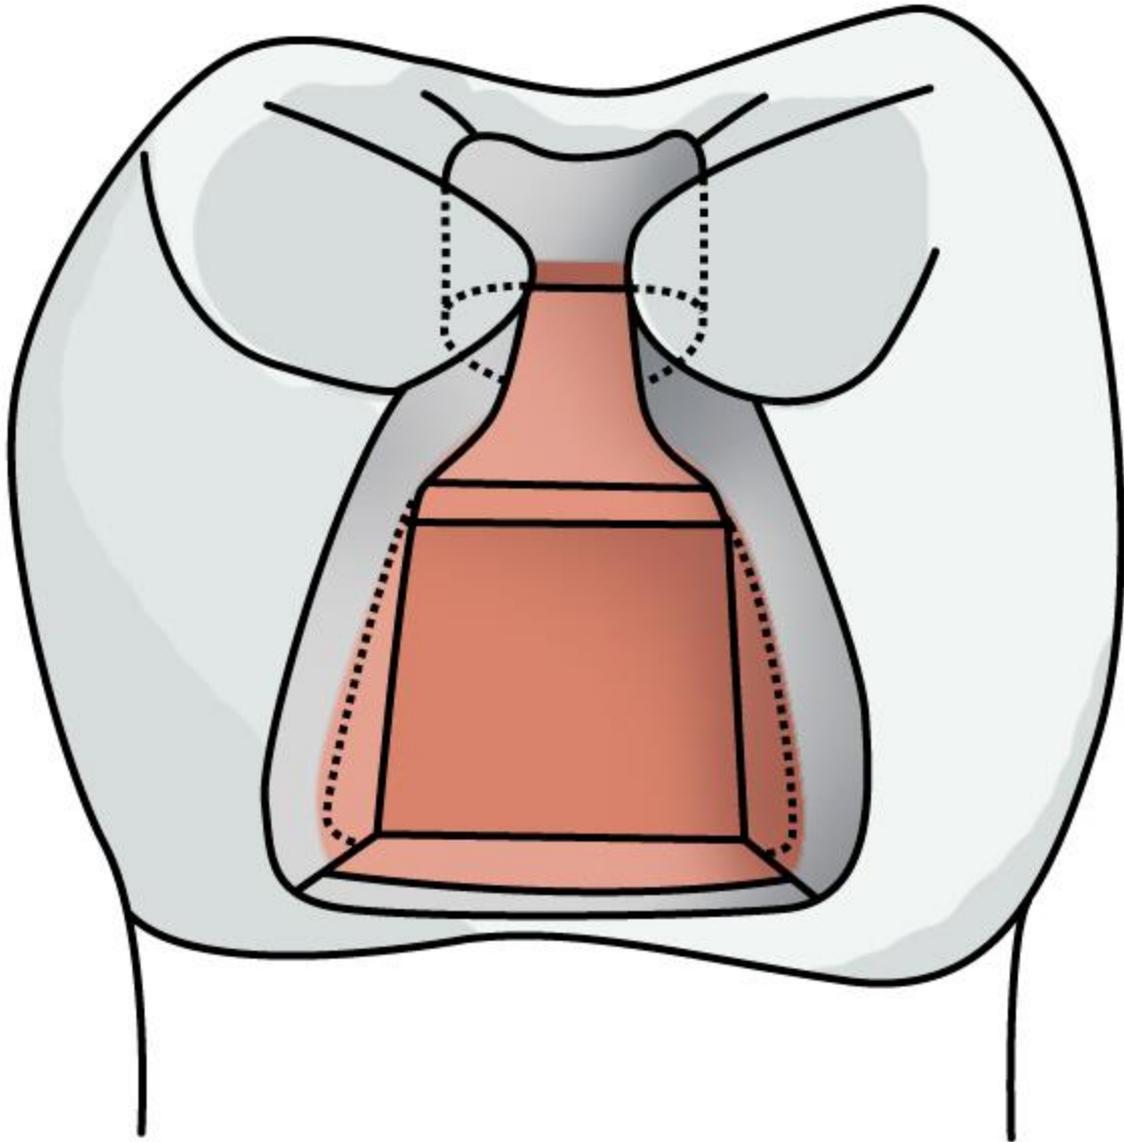

Cavosurface margin – axial walls

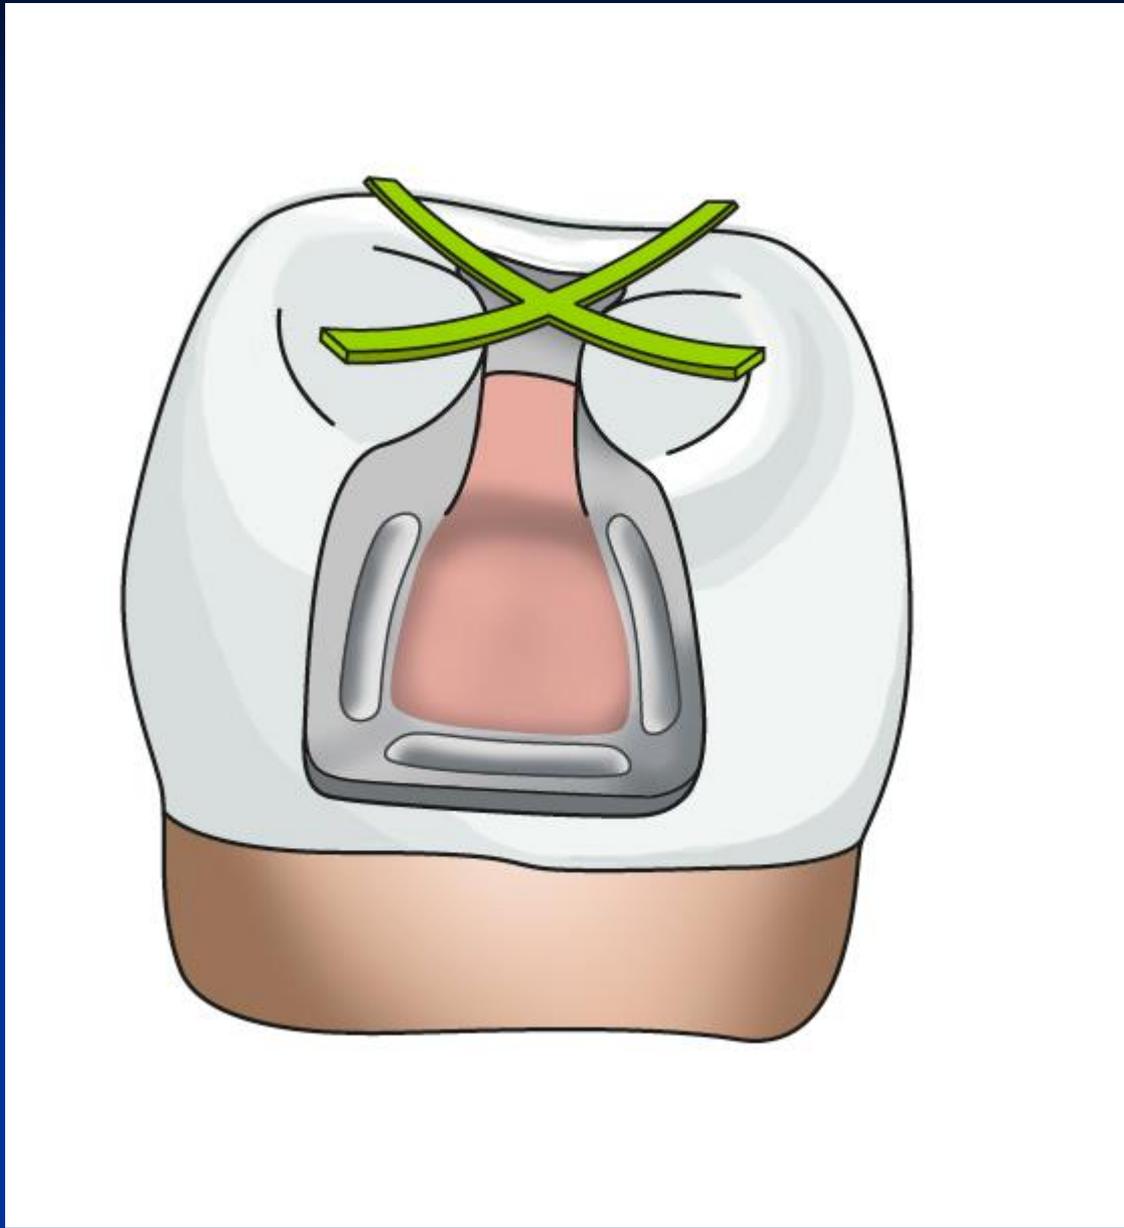

- Check the contact area – the filling must reconstruct the contact area –and be apprx. 0,5 mm over

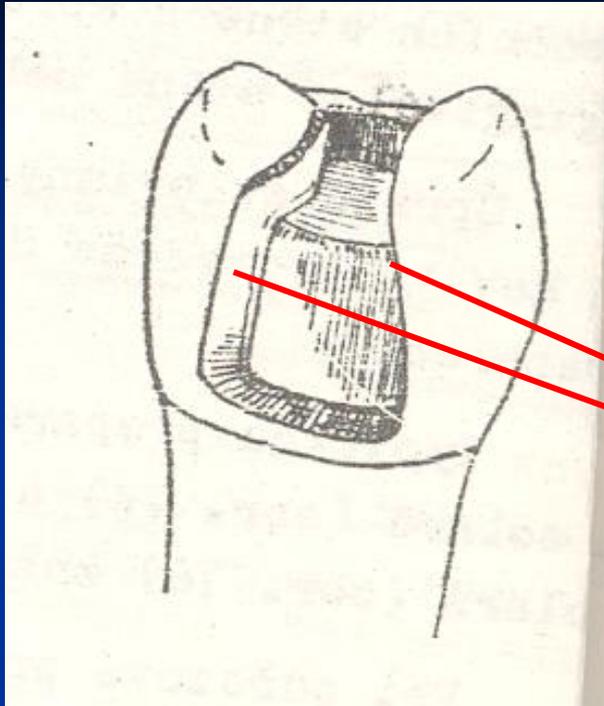

Retention

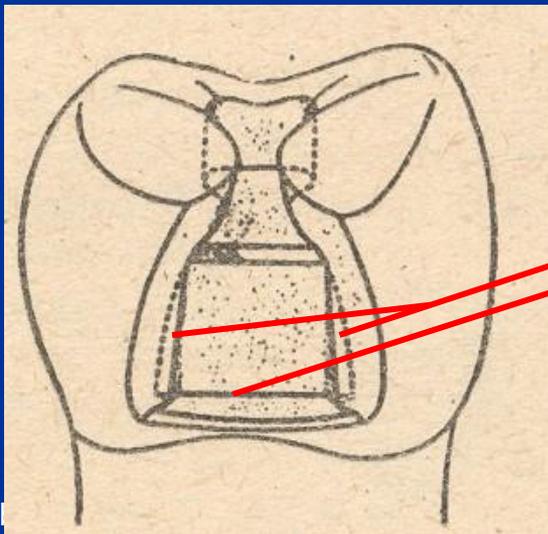

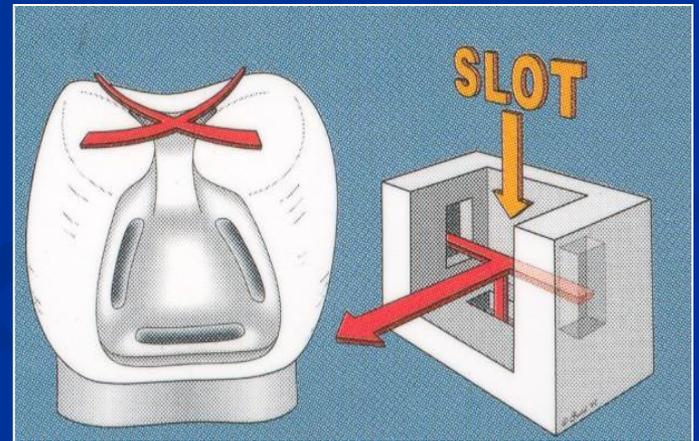

- Occlusal cavity – auxiliary cavity
- Undercuts
- Grooves

Autoretention

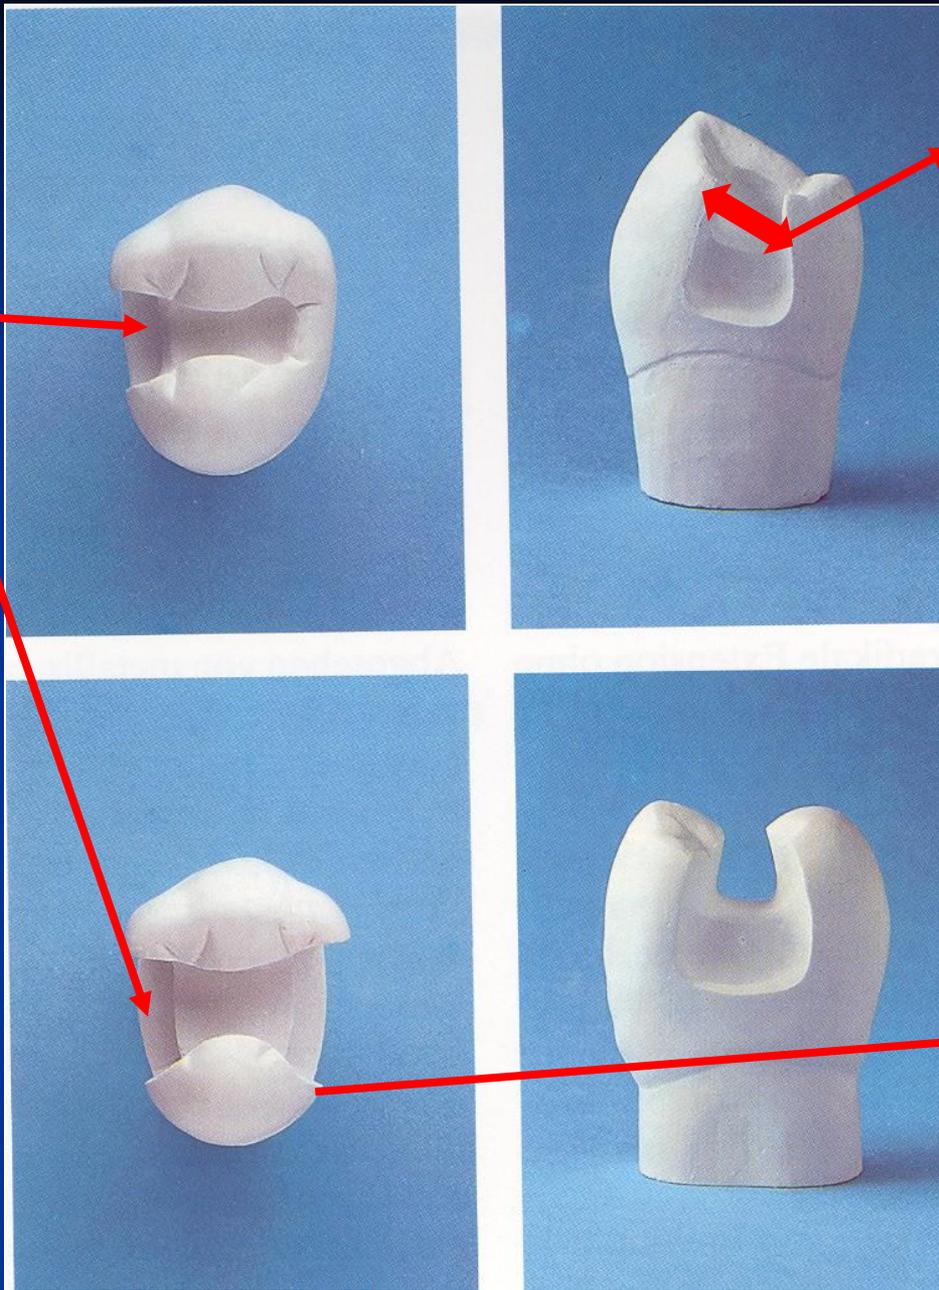

Grooves

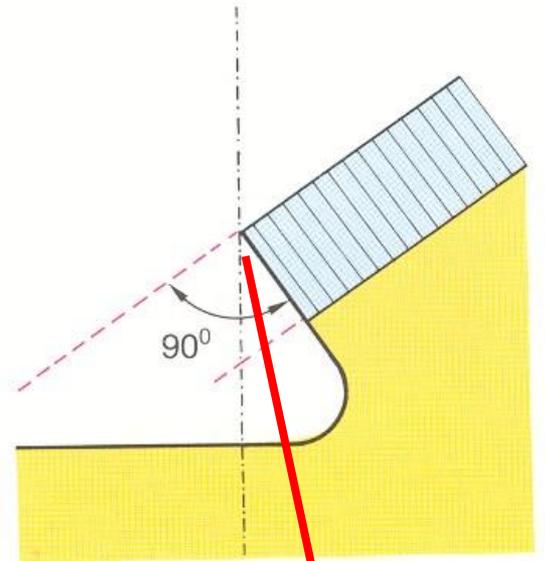

Resistance

- No undermined enamel
- No sharp wedges
- Isthmus is $1/3 - 1/4$ intercuspidal distance
- Angle between axial and gingival wall: 90° , or 85°
- Width of gingival wall is 1 mm at least
- Thickness of the filling 2 – 4 mm (4mm cusp replacing)

G. wall

Isthmus

Cavosurface angle

Excavation of carious dentin

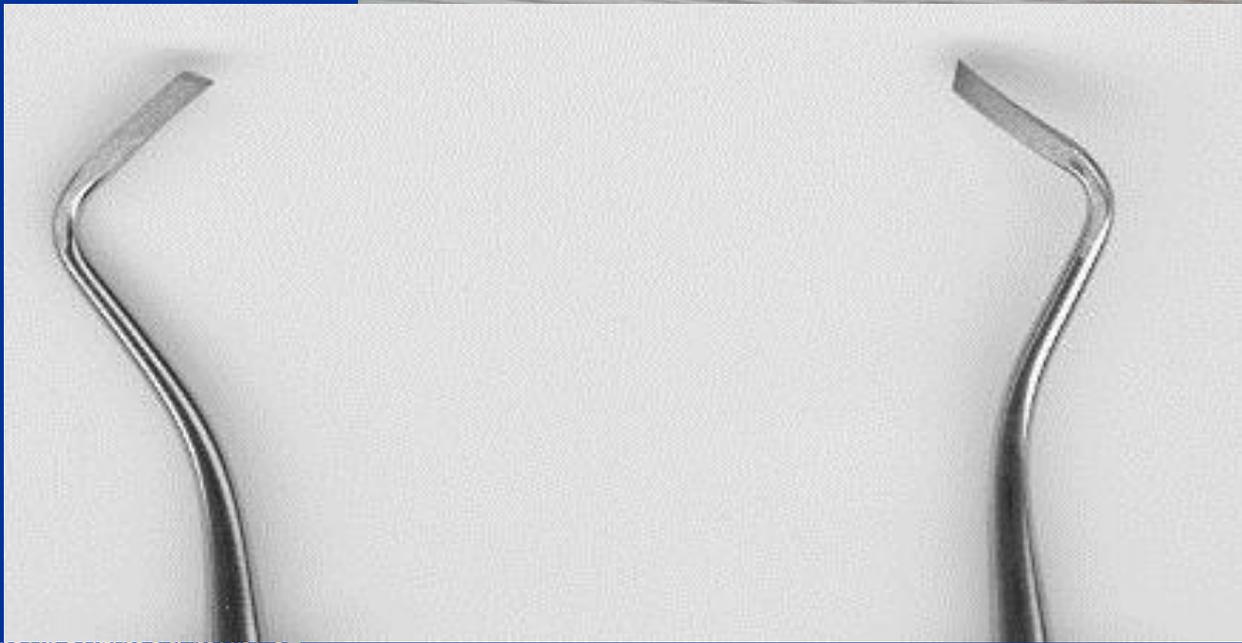

Rounded bur

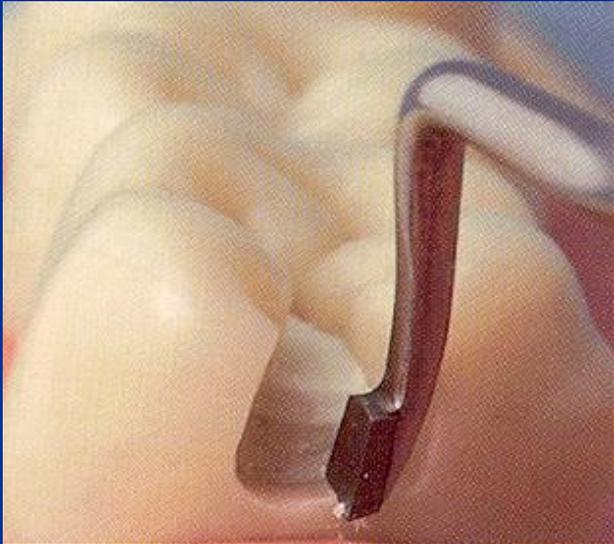

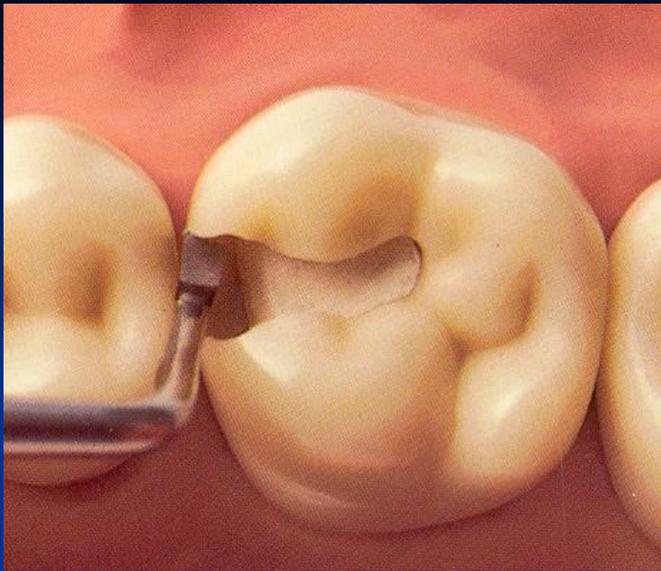

(Caries Detector, Kuraray, Japonsko; Caries Marker, VOCO, Německo)

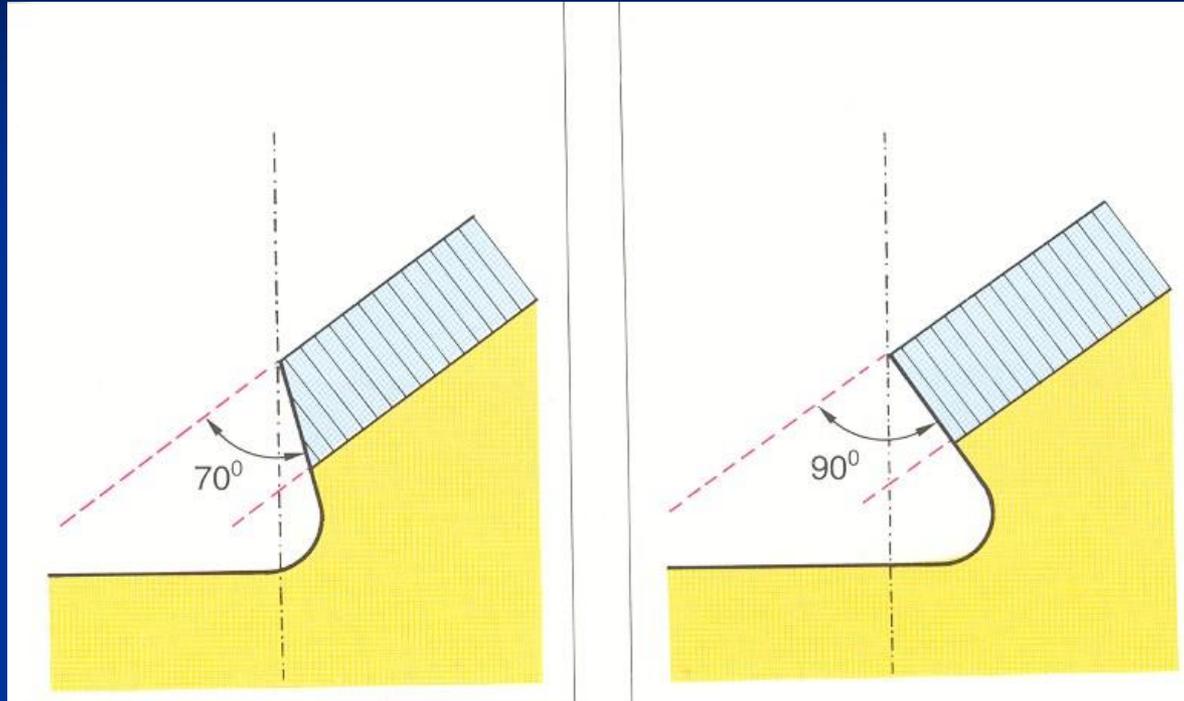

Finishing of cavity walls

- Red coded diamond bur
- Chisel on the gingival wall (if in enamel)

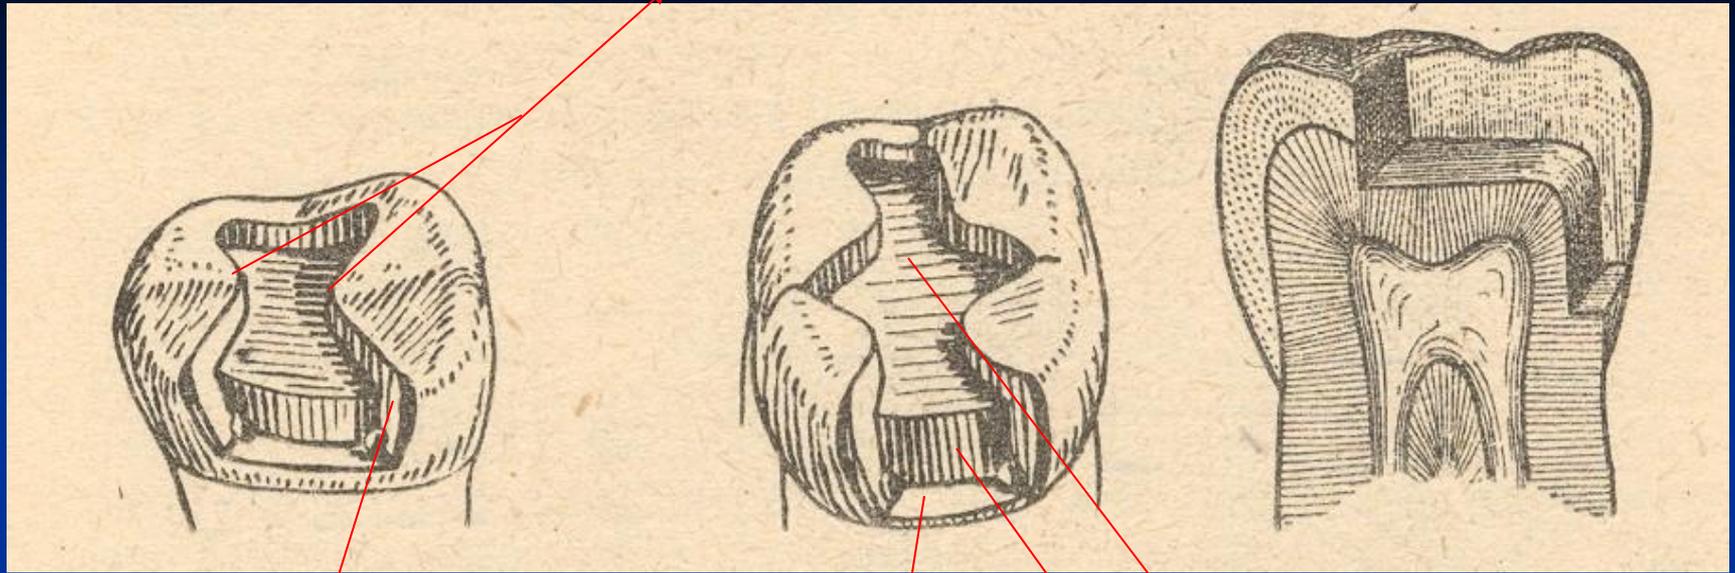

Cavity control

➤ Goog light, miror

Isthmus

Axial wall

Pulpal wall

Gingival wall

Matrix placement

- Matrix primarily is used when a proximal surface is to be restored

The objectives:

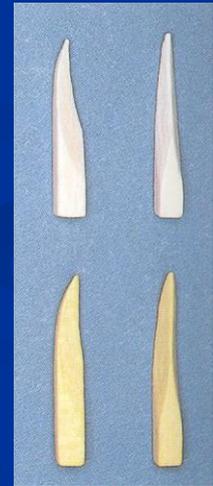

- Provide proper contact
- Provide proper contour
- Confine the restorative material
- Reduce the amount of excess material

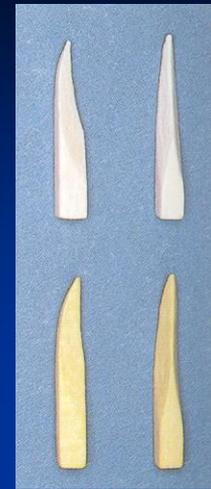

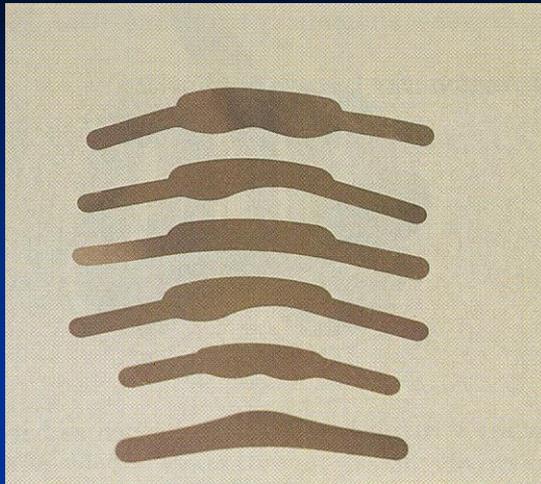

Matrices

- Ivory I retainer Ivory 1
- Hawe Neos retainer Ivory 8
- Tofelmire matix and retainer

Wedges

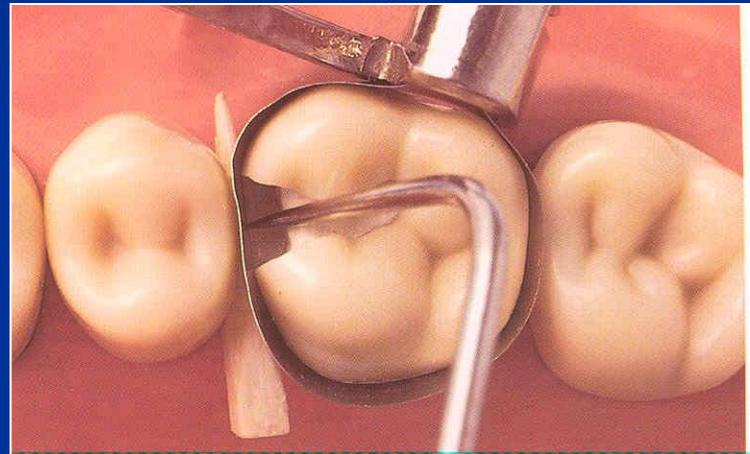

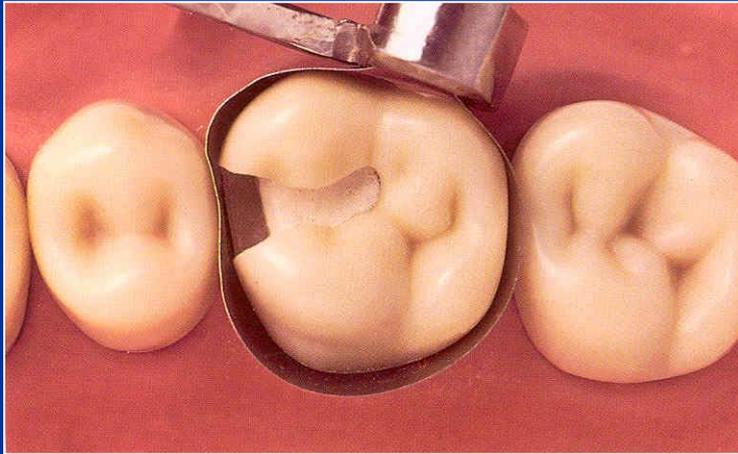

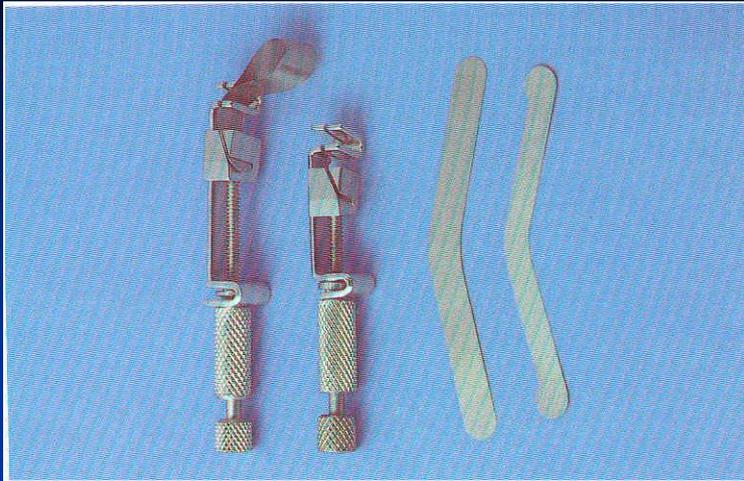

- Wooden wedges
 - tighten the matrix band
 - compress the gingiva
 - separate the teeth

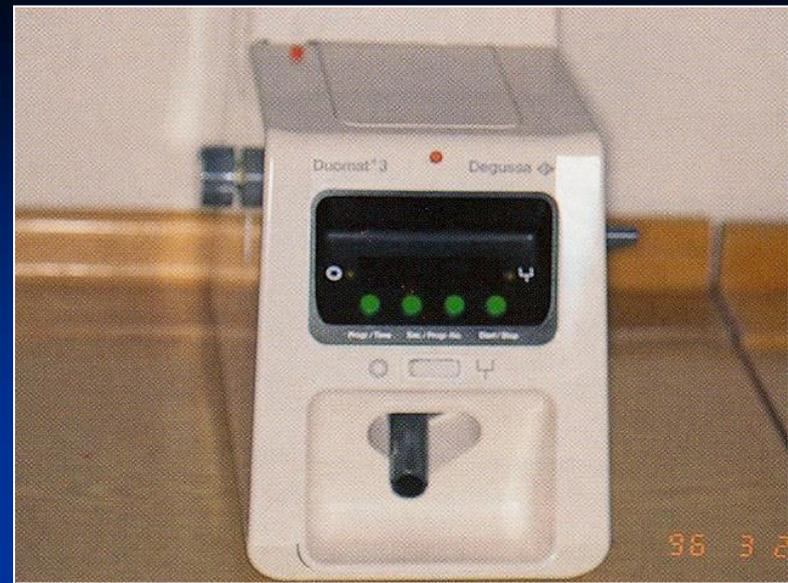

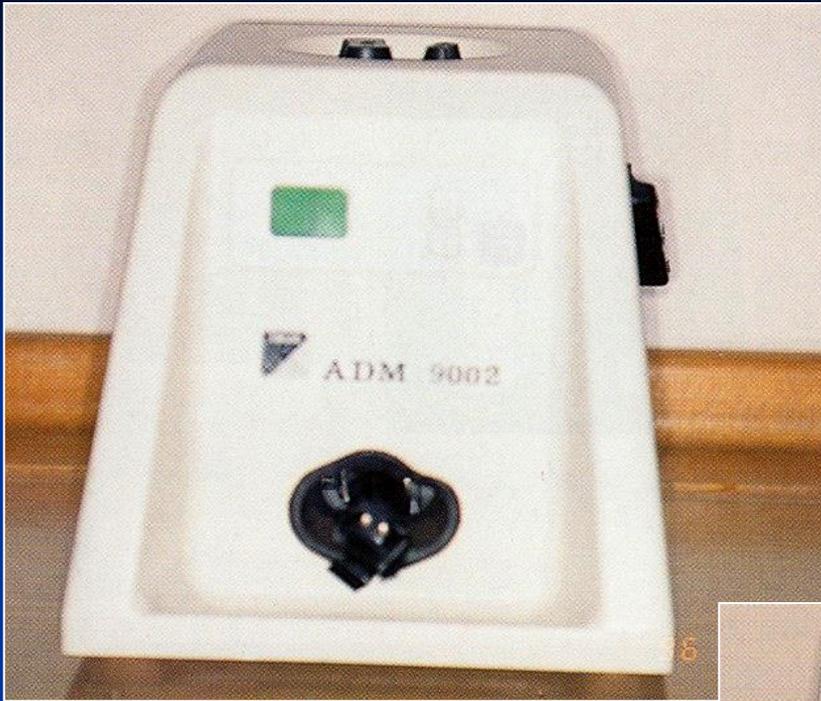

Wedging

- Slip the matrix band over the tooth (apical to the gingiva margin – 0,5, - 1 mm)
- Tighten the matrix, check it with probe
- Place a wedge
- Turn the retainer $\frac{1}{4}$ counterclockwise
- Contour the band

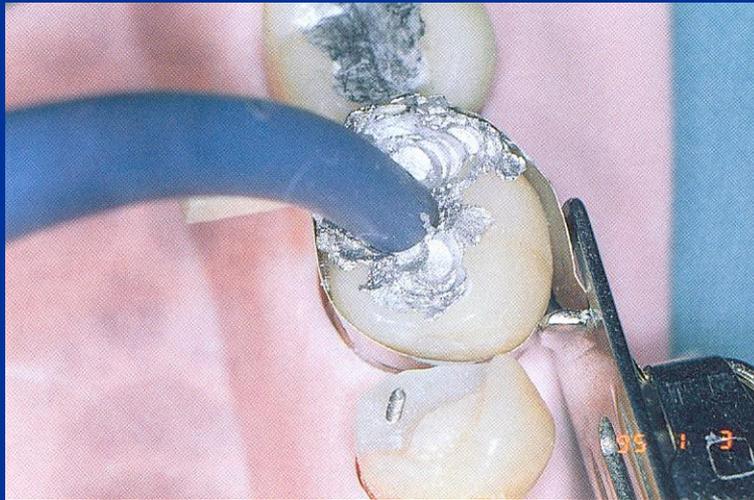

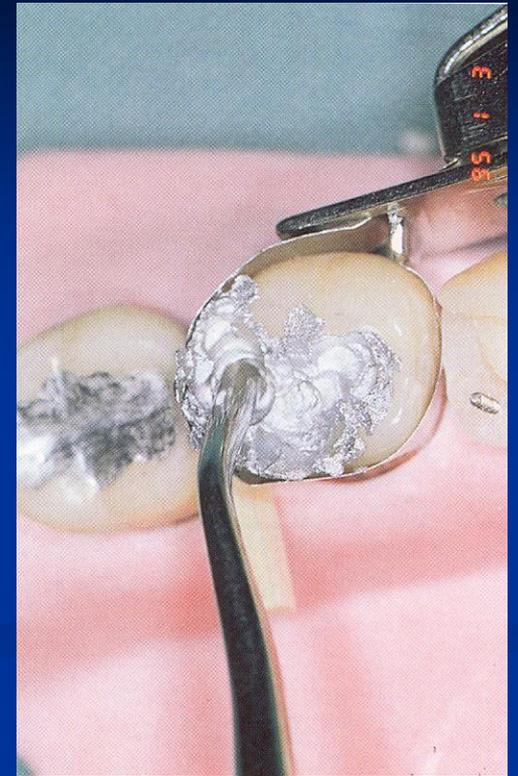

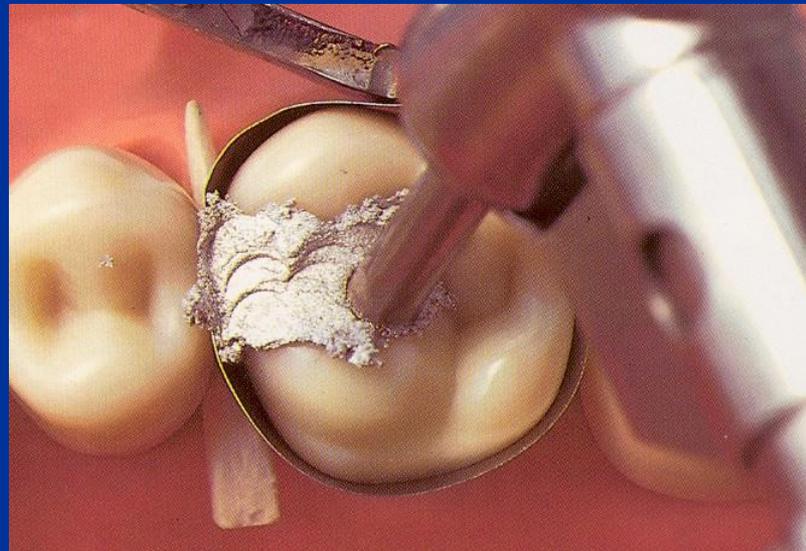

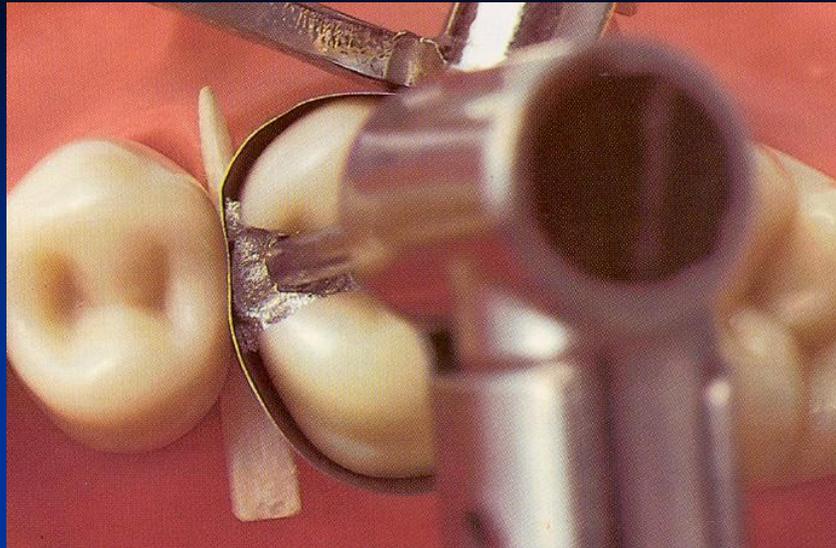

Trituration!

Condensation of amalgam

- Condensor – stamen is the best one
- Power driven condensation

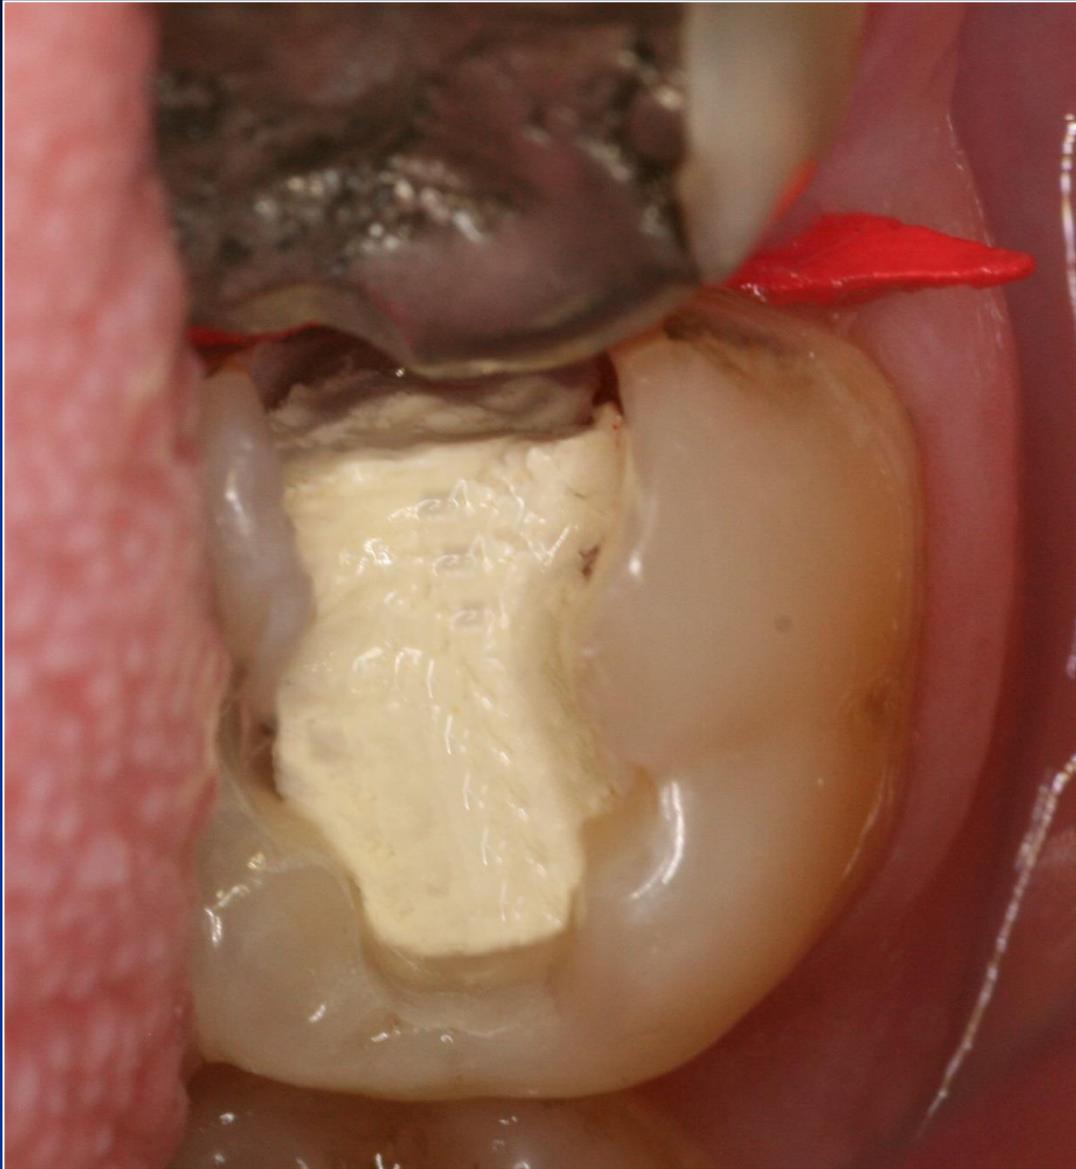

How big the stamen should be??

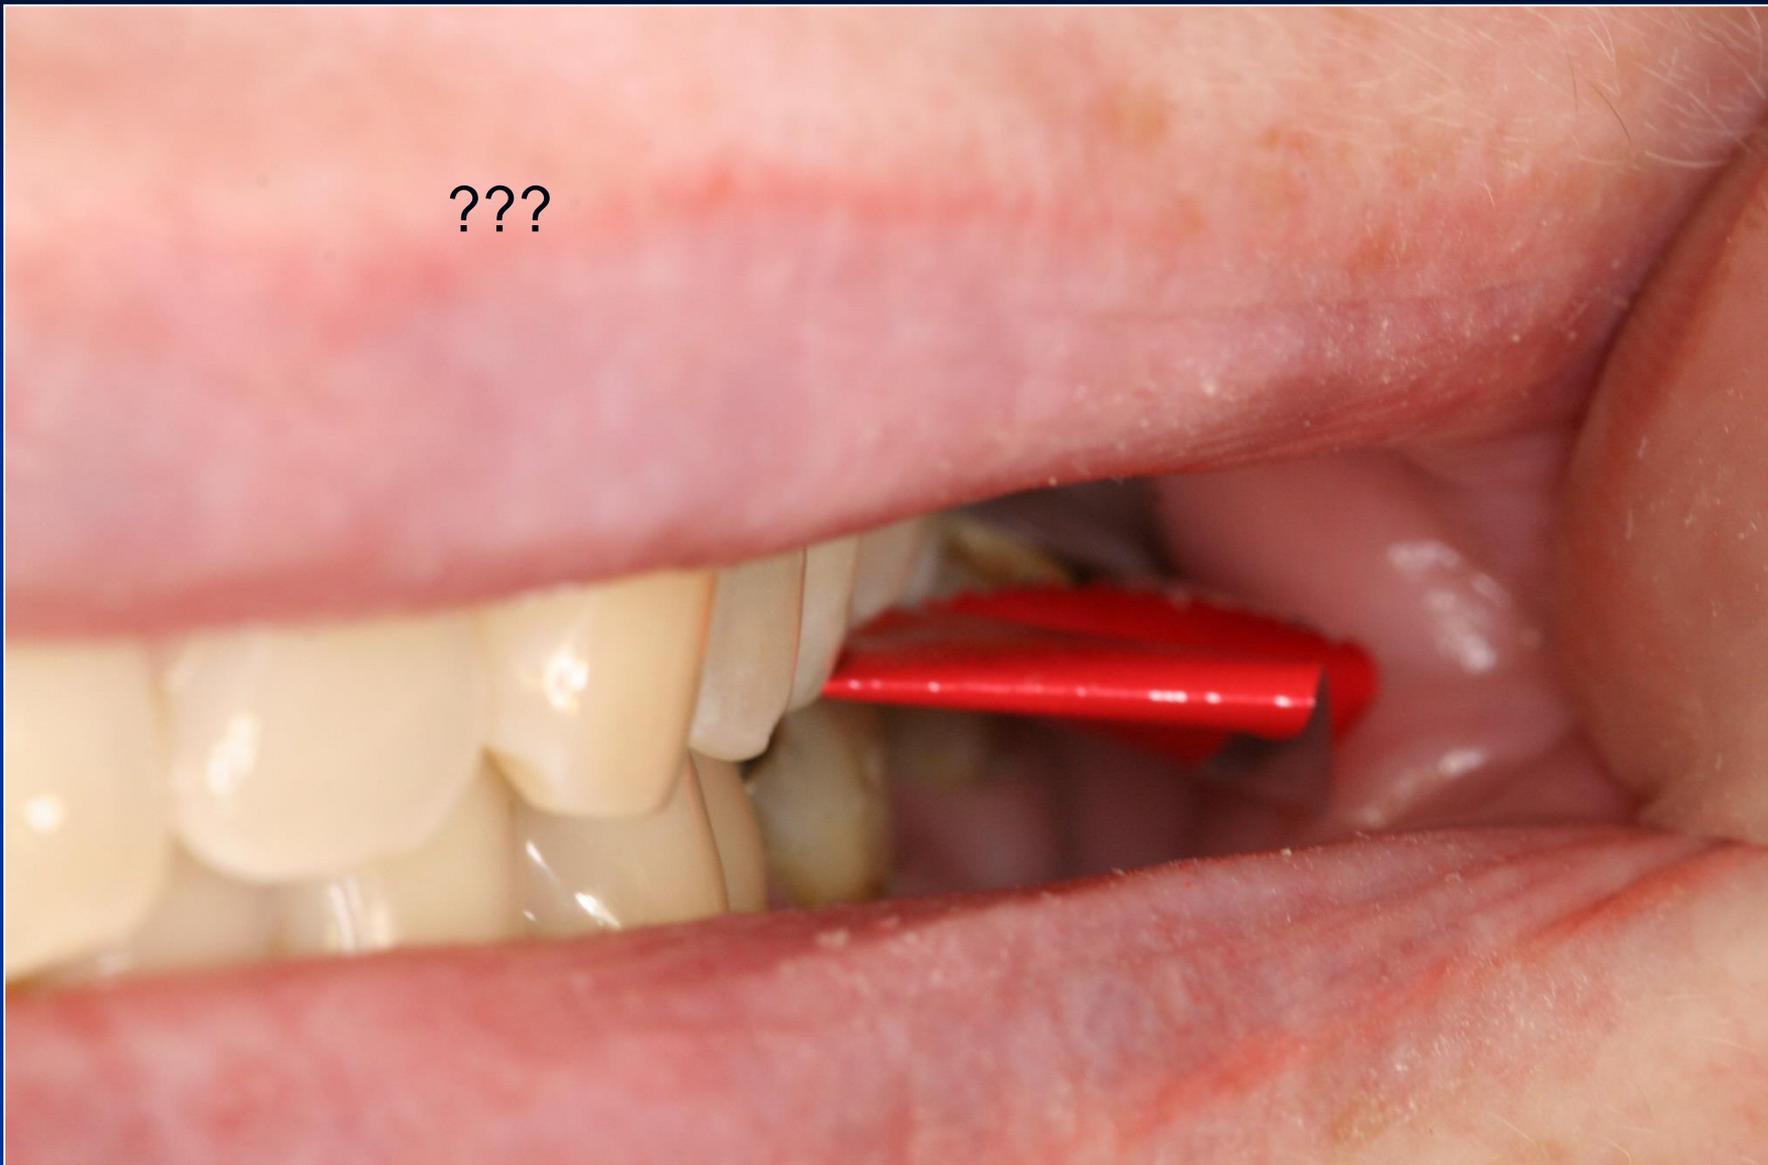

???

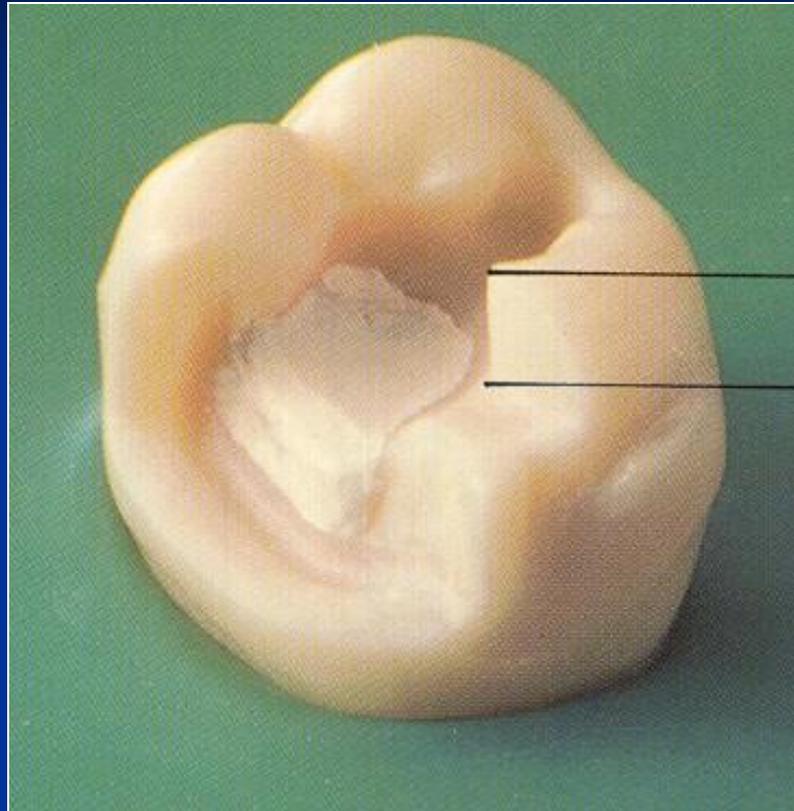

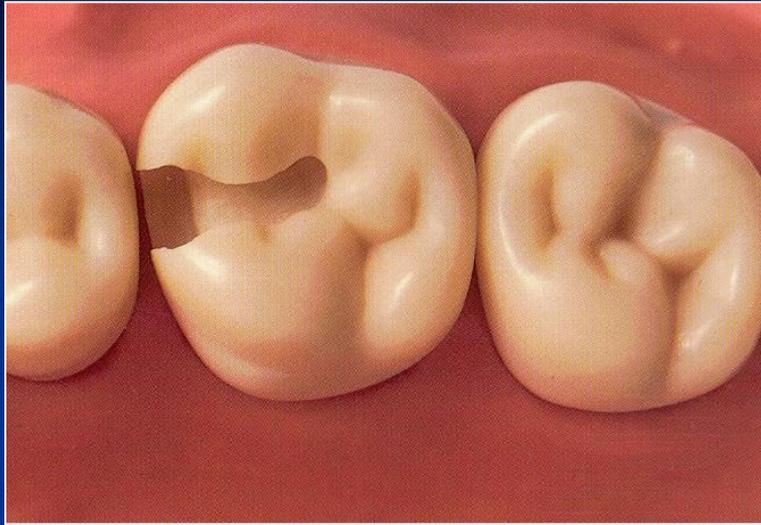

Base

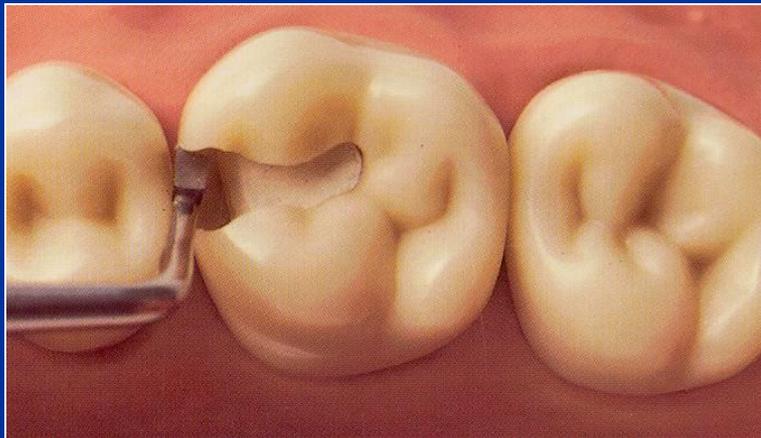

- Zinkoxidphosphate cement
- Zinkoxidkarboxylate cement
- Glass ionomer cement
- Zinkoxideugenol

On pulpal walls only!

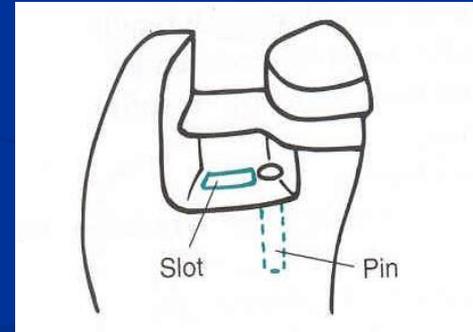

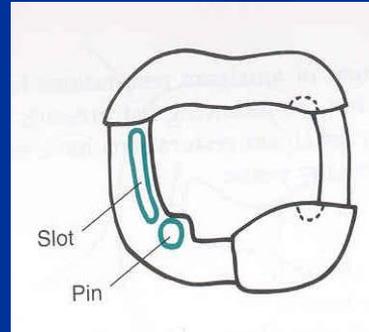

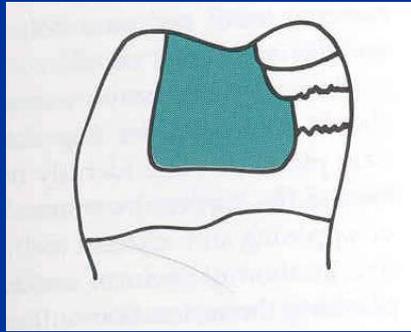

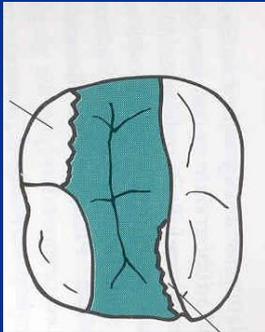

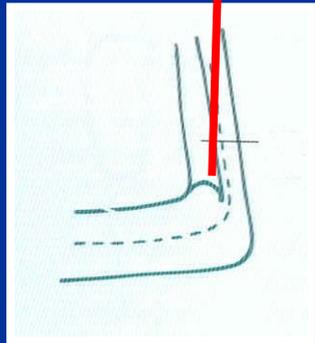

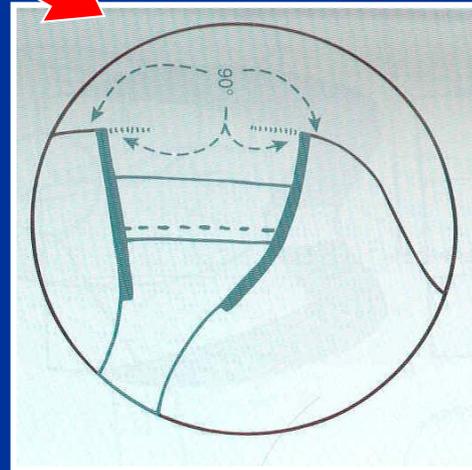

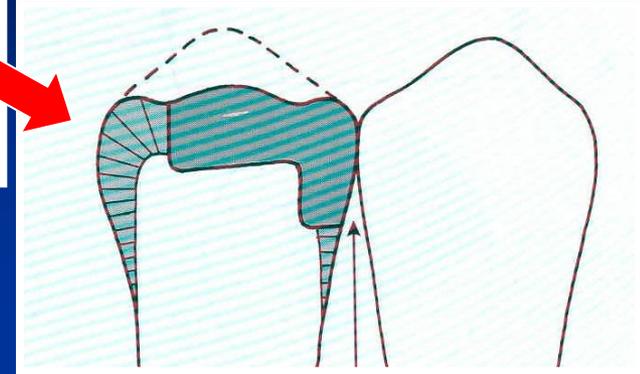

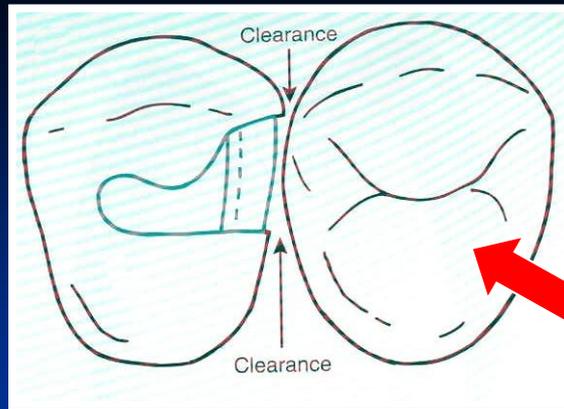

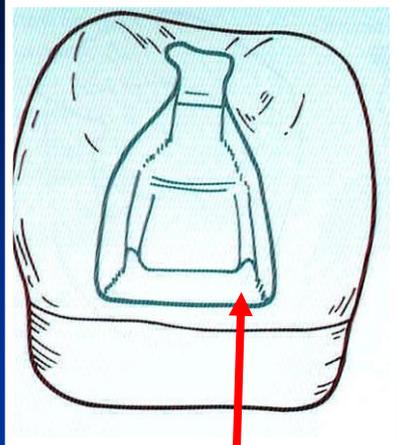

The base must be hardened

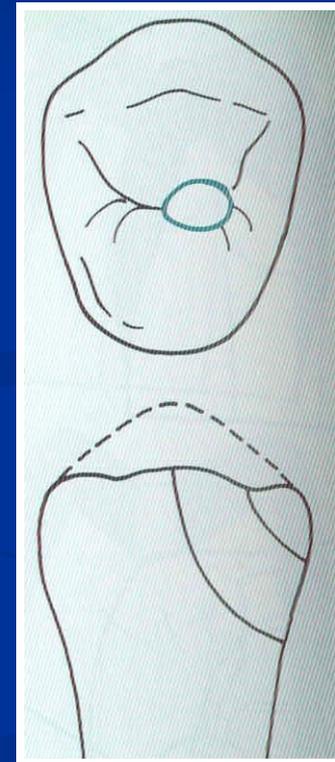

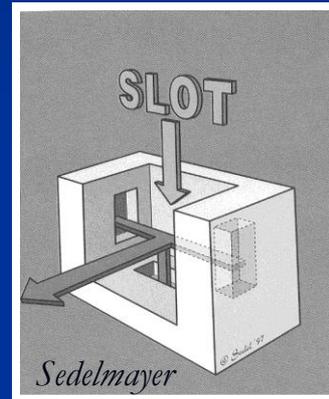

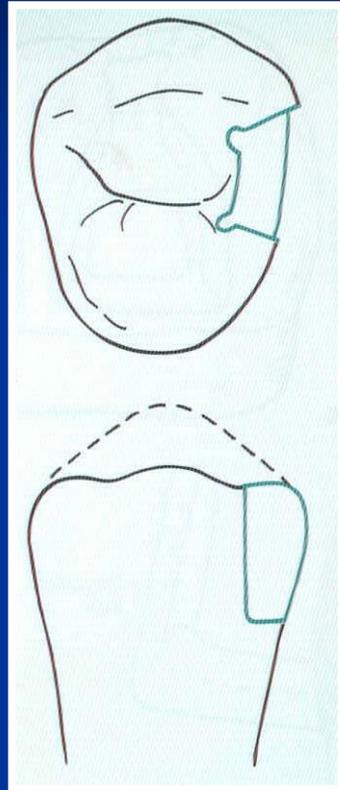

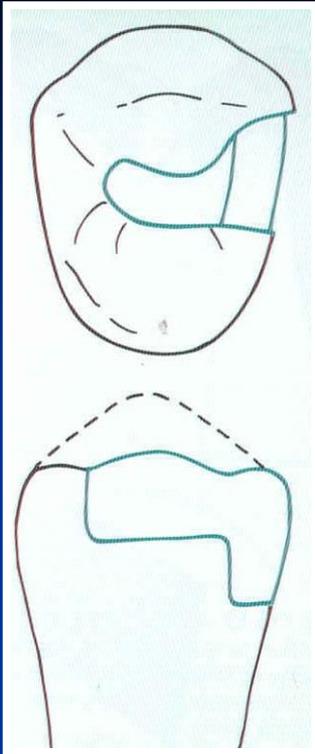

Amalgam

Retention

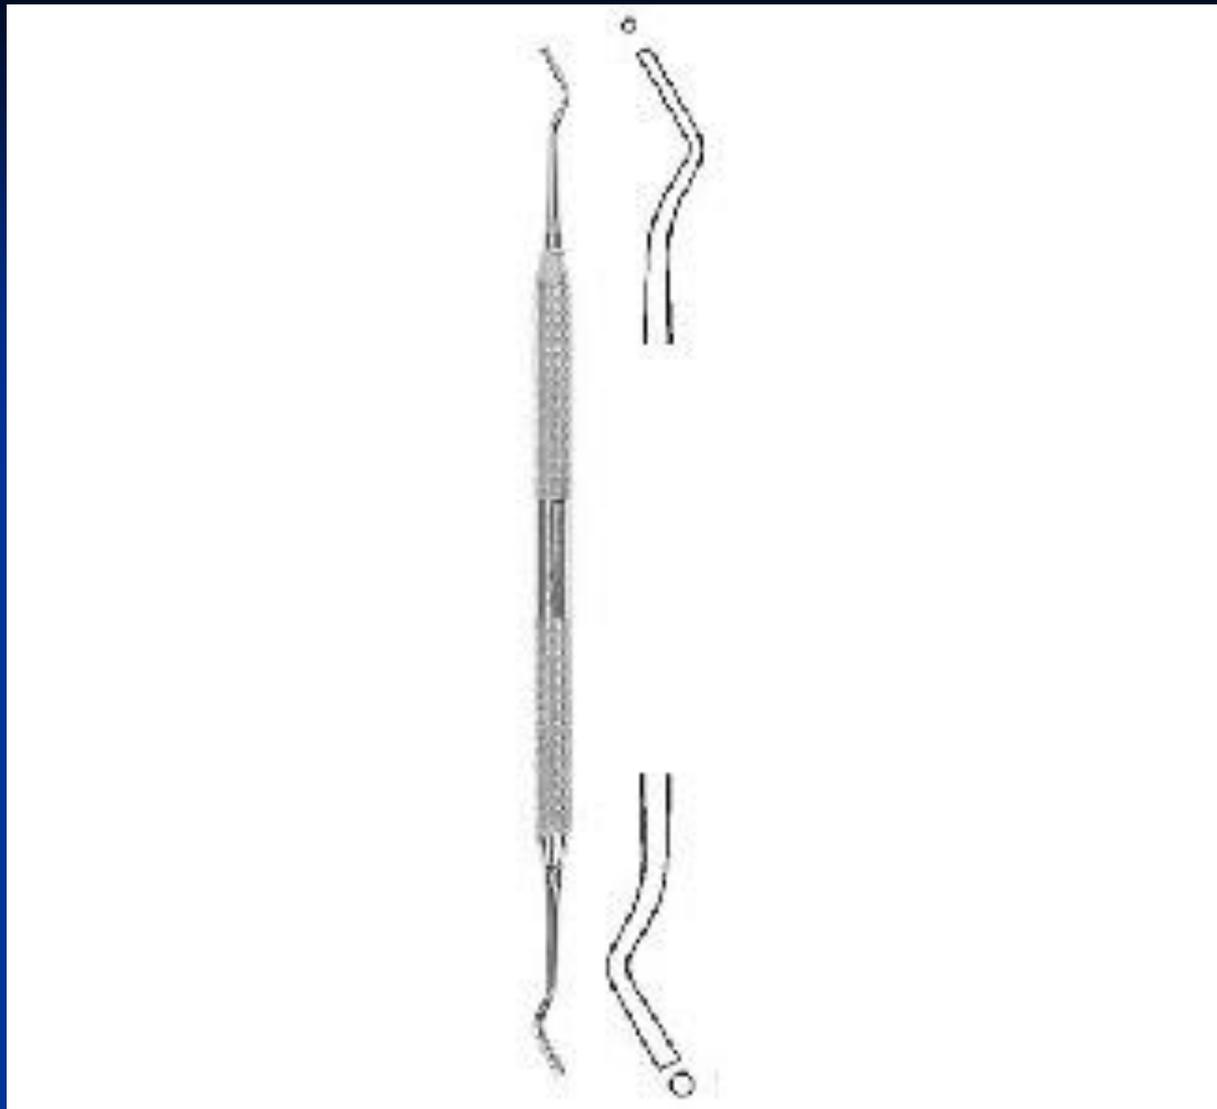

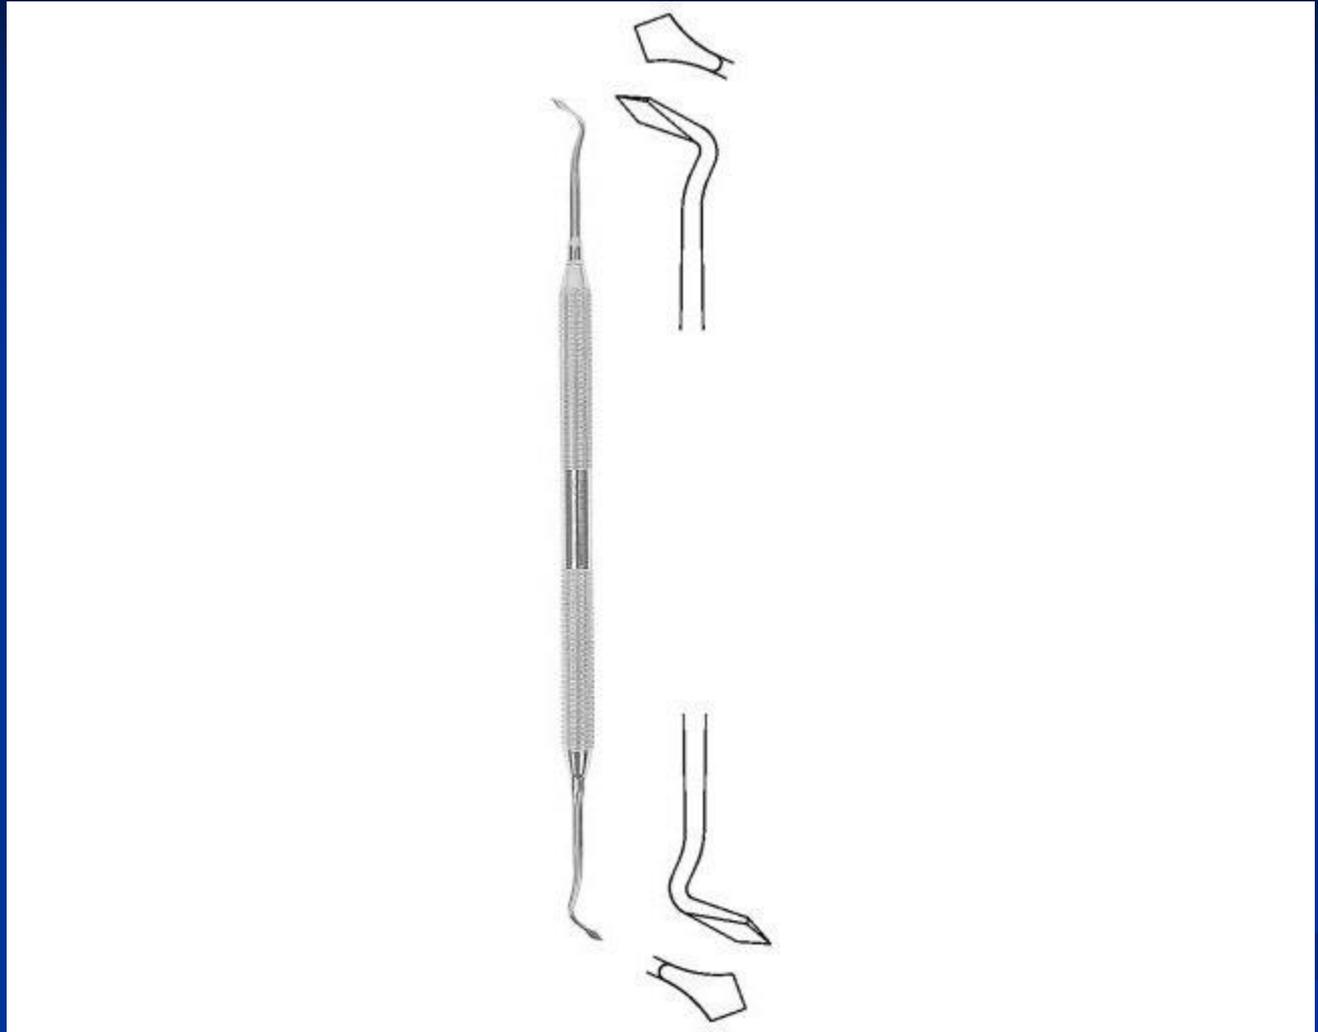

Instruments

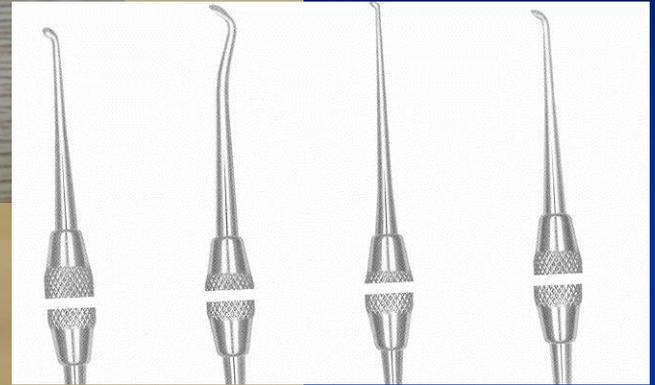

- Preparation
- Filling
- Finishing and polishing
