

# Functional morphology of kidneys Clearance

Assoc. Prof. MUDr. Markéta Bébarová, Ph.D.

*Department of Physiology*

*Faculty of Medicine, Masaryk University*

**This presentation includes only the most important terms and facts. Its content by itself is not a sufficient source of information required to pass the Physiology exam.**

# Renal Functions

- Excretion of Waste Products and Toxins
- Control of Volume and Composition of Body Fluids, Osmolality
- Regulation of Acid-Base Balance
- Regulation of Blood Pressure
- Secretion, Metabolism and Excretion of Hormones
- Glukoneogenesis

# Structure of Kidney

**(a) Frontal section illustrating major blood vessels**

© 2013 Pearson Education, Inc.

**(b) Path of blood flow through renal blood vessels**

- collecting duct

Collecting duct

*Ganong's Review of Medical Physiology, 23<sup>rd</sup> edition*

# Urine Formation

- 1) Glomerular filtration
- 2) Tubular reabsorption
- 3) Tubular secretion
- 4) Urine excretion

*Guyton & Hall. Textbook of Medical Physiology*

# Urine Formation

*Guyton & Hall. Textbook of Medical Physiology*

- creatinine
- other waste products
- electrolytes
- amino acids
- glucose
- PAH
- toxins
- organic base and acids

# Urine Formation

*Guyton & Hall. Textbook of Medical Physiology*

- creatinine
- other waste products

Substance	Concentration in		
	Urine (U)	Plasma (P)	U/P Ratio
Glucose (mg/dL)	0	100	0
Na <sup>+</sup> (mEq/L)	90	140	0.6
Urea (mg/dL)	900	15	60
Creatinine (mg/dL)	150	1	150

- PAH
- toxins
- organic base and acids

# Urine Formation - Glomerular Filtration

GFR = 125 ml/min = 180 l/day

FF = 0.2

20% of plasma filtered!

Guyton & Hall. Textbook of Medical Physiology

Ganong's Review of Medical Physiology, 23<sup>rd</sup> edition

# Urine Formation - Glomerular Filtration

Glomerular filtration rate (GFR) depends on:

- 1) Capillary filtration coefficient  $K_f$   
(permeability and area of glomerular membrane; mesangial cells)
- 2) Balance of hydrostatic and colloid osmotic forces

$$\text{GFR} = K_f \cdot \text{net filtration pressure}$$

# Urine Formation - Glomerular Filtration

Glomerular filtration rate (GFR) depends on:

- 1) Capillary filtration coefficient  $K_f$   
(permeability and area of glomerular membrane; mesangial cells)
- 2) Balance of hydrostatic and colloid osmotic forces

$$\text{GFR} = K_f \cdot \text{net filtration pressure}$$

# Urine Formation - Glomerular Filtration

$$\text{GFR} = K_f \cdot \text{net filtration pressure}$$

*Ganong's Review of Medical Physiology, 23<sup>rd</sup> edition*

*Guyton & Hall. Textbook of Medical Physiology*

Under physiological conditions:

$$\text{net filtration pressure} = P_G + \pi_B - P_B - \pi_G = 60 + 0 - 18 - 32 = 10 \text{ mmHg}$$

$$\text{GFR} = K_f \cdot (P_G + \pi_B - P_B - \pi_G)$$

# Urine Formation - Glomerular Filtration

## *Vas afferens, vas efferens*

- input and output of high-pressure glomerular capillary net

- glomerular blood flow = 
$$\frac{P_{v.a.} - P_{v.e.}}{R_{v.a.} + R_{v.e.} + \cancel{R_{g.k.}}}$$

- **↑ resistance** of *vas aff.* or *vas eff.* → **↓ renal blood flow**  
(if the arterial pressure is stable)
- **control the glomerular filtration pressure:**

constriction of *vas aff.* → ↓ glomerular pressure → ↓ filtration

constriction of *vas eff.* → ↑ glomerular pressure → ↑ filtration

# Urine Formation – Tubular Processes

*Guyton & Hall. Textbook of Medical Physiology*

# Urine Formation – Tubular Processes

## *Active Transport Mechanisms*

- 1) Primary active transport
- 2) Secondary active transport
- 3) Pinocytosis  
(big molecules, e.g. proteins, namely in the proximal tubule)

# Urine Formation – Tubular Processes

## *Active Transport Mechanisms*

### 1) Primary active transport

*Guyton & Hall. Textbook of Medical Physiology*

# Urine Formation – Tubular Processes

## *Active Transport Mechanisms*

### 1) Primary active transport

- $\text{Na}^+/\text{K}^+$  ATPase
- $\text{H}^+$  ATPase
- $\text{H}^+/\text{K}^+$  ATPase
- $\text{Ca}^{2+}$  ATPase

# Urine Formation – Tubular Processes

## *Active Transport Mechanisms*

### 2) Secondary active transport

*Guyton & Hall. Textbook of Medical Physiology*

# Urine Formation – Tubular Processes

## *Active Transport Mechanisms*

Substances using active transport show the so called **transport maximum** (given by saturation of the transporter).

for example **glucose**  
*transport maximum:*  
*~320 mg/min*

*Guyton & Hall. Textbook of Medical Physiology*

# Urine Formation – Tubular Processes

## *Active Transport Mechanisms*

Substances using active transport show the so called **transport maximum** (given by saturation of the transporter).

### reabsorption

Substance	Transport Maximum
Glucose	375 mg/min
Phosphate	0.10 mM/min
Sulfate	0.06 mM/min
Amino acids	1.5 mM/min
Urate	15 mg/min
Lactate	75 mg/min
Plasma protein	30 mg/min

### secretion

Substance	Transport Maximum
Creatinine	16 mg/min
Para-aminohippuric acid	80 mg/min

# Urine Formation – Tubular Processes

## *Active Transport Mechanisms*

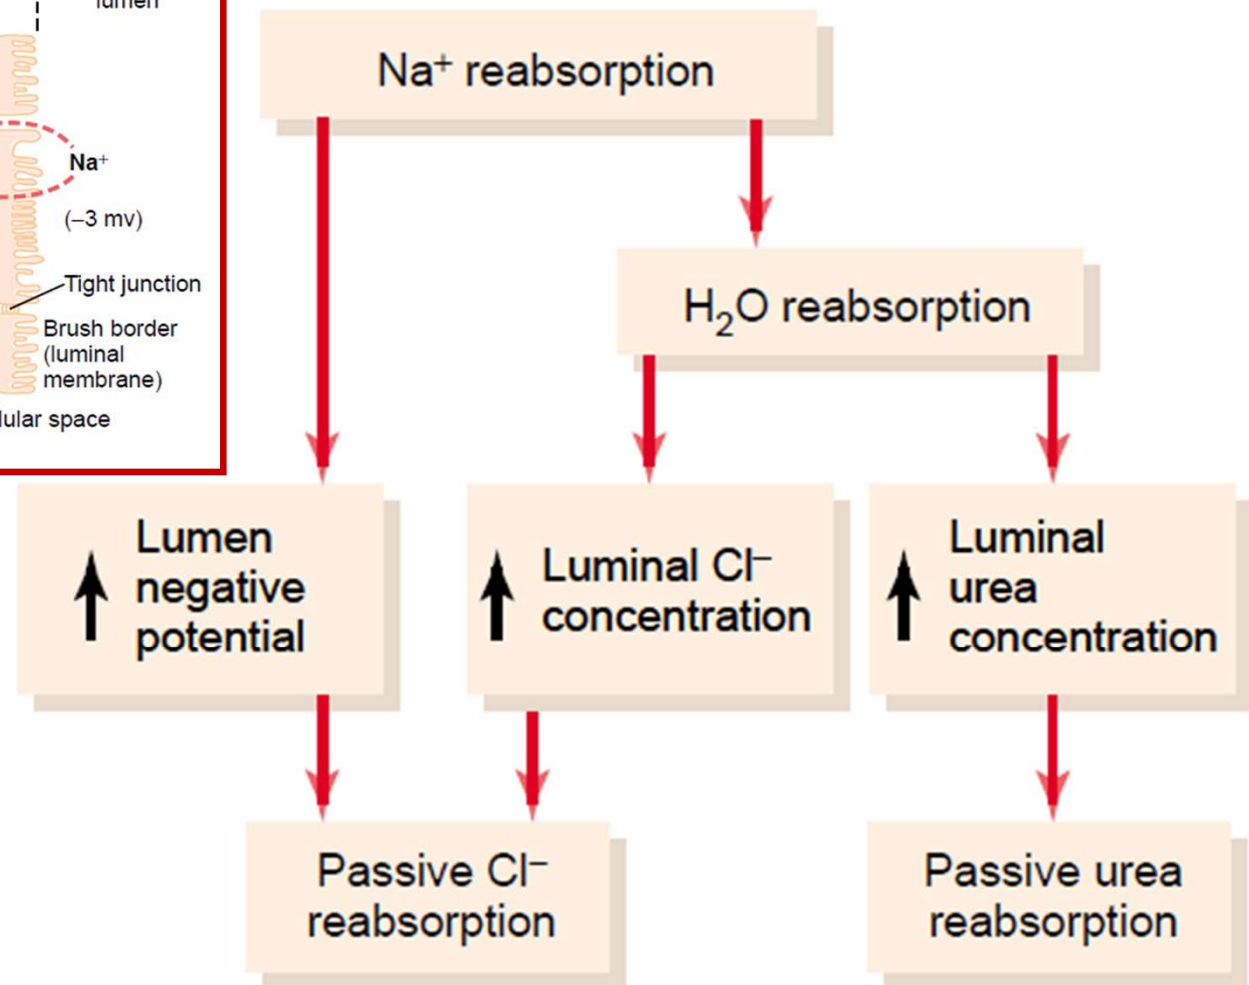

- 1) Primary active transport
- 2) Secondary active transport
- 3) Pinocytosis  
(big molecules, e.g. proteins, namely in the proximal tubule)

## *Passive Transport Mechanisms*

- 1) Reabsorption of  $\text{H}_2\text{O}$  by osmosis
  - in the proximal tubule (highly permeable for  $\text{H}_2\text{O}$ )
  - active reabsorption of solutes  $\rightarrow$  lumen-intersticium concentration gradient  $\rightarrow$   $\text{H}_2\text{O}$  osmosis into intersticium
- 2) Reabsorption of solutes by diffusion
  - $\text{Cl}^-$  ( $\text{Na}^+$  into intersticium, reabsorption of  $\text{H}_2\text{O}$  by osmosis)
  - urea (reabsorption of  $\text{H}_2\text{O}$  by osmosis)

# Urine Formation – Tubular Processes

*Guyton & Hall. Textbook of Medical Physiology*

# Urine Formation – Tubular Processes

*Guyton & Hall. Textbook of Medical Physiology*

# Urine Formation – Tubular Processes

## *Physical Forces in Peritubular Capillaries and in Renal Interstitium*

- tubular reabsorption is controlled by hydrostatic and colloid osmotic forces (similarly to GFR)

$$\text{GFR} = K_f \cdot \text{net filtration pressure}$$

$$\text{TRR} = K_f \cdot \text{net reabsorptive force}$$

# Urine Formation – Tubular Processes

## *Physical Forces in Peritubular Capillaries and in Renal Intersticium*

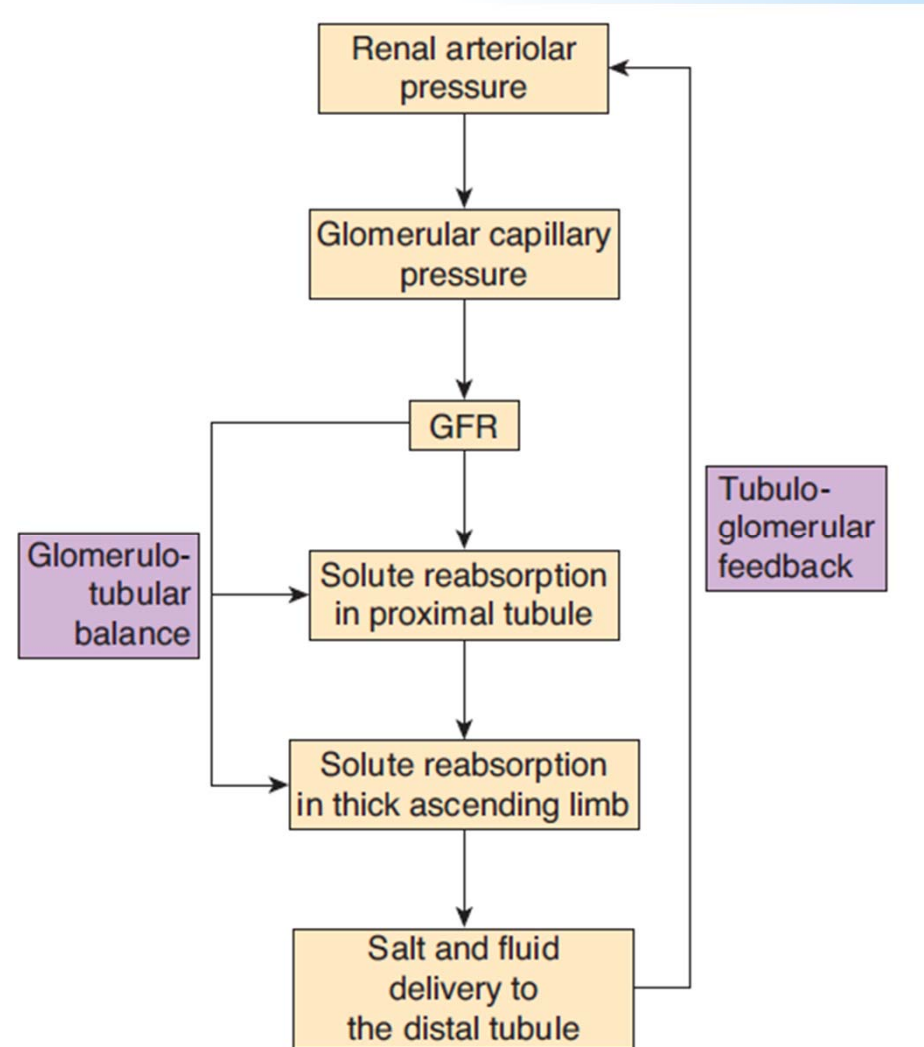

Guyton & Hall.  
Textbook of  
Medical Physiology

# Urine Formation – Tubular Processes

**Tubuloglomerular feedback**

**Glomerulotubular balance**

*Ganong's Review of Medical Physiology, 23<sup>rd</sup> edition*

# Urine Formation – Tubular Processes

## *Proximal Tubule*

- 1) complete reabsorption of substances playing key roles for the organism (glucose, amino acids)
- 2) partial reabsorption of substances important for the organism (ions –  $\text{Na}^+$ ,  $\text{K}^+$ ,  $\text{Cl}^-$ , *etc.*)
- 3) reabsorption of water
- 4) secretion of  $\text{H}^+$
- 5) reabsorption of  $\text{HCO}_3^-$

### **Result:**

isoosmotic fluid,  
notably decreased  
volume

# Urine Formation – Tubular Processes

## *Loop of Henle*

- 1) **thin descending part** - passive reabsorption of water (osmosis)
- 2) **thick ascending part** - active reabsorption of ions ( $\text{Na}^+/\text{K}^+/\text{2Cl}^-$  symport), secretion of  $\text{H}^+$ , reabsorption of  $\text{HCO}_3^-$

counter-current multiplier

**Result:** hypotonic fluid, volume further decreased

# Urine Formation – Tubular Processes

## *Loop of Henle*

- 1) **thin descending part** - passive reabsorption of water (osmosis)
- 2) **thick ascending part** - active reabsorption of ions ( $\text{Na}^+/\text{K}^+/\text{2Cl}^-$  symport), secretion of  $\text{H}^+$ , reabsorption of  $\text{HCO}_3^-$

# Urine Formation – Tubular Processes

## *Distal tubule*

- 1) juxtaglomerular apparatus
- 2) active reabsorption of solutes **similar to the thick ascending loop of Henle**, also no permeability for urea and water – the so called dilution segment (dilutes the tubular fluid)

**Result:** hypotonic fluid

# Urine Formation – Tubular Processes

## *Collecting duct (+ end of distal tubule)*

- 1) **principal cells** – reabsorption of  $\text{Na}^+$  and water (ADH), secretion of  $\text{K}^+$

# Urine Formation – Tubular Processes

## *Collecting duct (+ end of distal tubule)*

- 1) **principal cells** – reabsorption of  $\text{Na}^+$  and water (ADH), secretion of  $\text{K}^+$
- 2) **intercalated cells** – secretion of  $\text{H}^+$ , reabsorption of  $\text{HCO}_3^-$  and  $\text{K}^+$

# Urine Formation – Tubular Processes

## *Collecting duct – medullar part*

- 1) reabsorption of  $\text{Na}^+$  and  $\text{Cl}^-$ , water (ADH), urea
- 2) secretion of  $\text{H}^+$ , reabsorption of  $\text{HCO}_3^-$

# Urine Formation – Tubular Processes

pronounced secretion in comparison with H<sub>2</sub>O

pronounced reabsorption in comparison with H<sub>2</sub>O

Guyton & Hall. Textbook of Medical Physiology

# Renal Clearance

= the volume of plasma that is cleared of the substance by kidneys per unit time

Using *clearance*, we can quantify the excretion ability of kidneys, the velocity of renal blood flow and even basic functions of kidneys (GFR, tubular reabsorption and secretion).

$$C_S \cdot P_S = V \cdot U_S \longrightarrow C_S = \frac{V \cdot U_S}{P_S}$$

[ml/min]

# Renal Clearance

## Determination of renal plasma flow velocity (RPF)

Clearance of a substance that is fully cleared from plasma in glomerulotubular apparatus.

PAH (paraaminohippuric acid) cleared by 90%

$$RPF = \frac{5.85 \times 1 \text{ mg/min}}{0.01 \text{ mg/ml}} = 585 \text{ ml/min}$$

*Guyton & Hall. Textbook of Medical Physiology*

Correction to the extraction ratio of PAH ( $E_{PAH}$ ):

$$E_{PAH} = \frac{P_{PAH} - V_{PAH}}{P_{PAH}} = 0.9 \longrightarrow RPF = \frac{585 \text{ ml/min}}{0.9} = 650 \text{ ml/min}$$

# Renal Clearance

## *Determination of glomerular filtration rate (GFR)*

Clearance of a substance that is fully filtered in the glomerulus and is not reabsorbed/secreted in tubules.

Inulin

Creatinine

*Guyton & Hall. Textbook of Medical Physiology*

# Renal Clearance

## *Calculation of Filtration Fraction (FF)*

FF is the fraction of plasma filtered through the glomerular membrane.

$$FF = \frac{GFR}{RPF} = \frac{125 \text{ ml/min}}{650 \text{ ml/min}} = 0.19 \rightarrow \sim 20\% \text{ of plasma is filtered in the glomerulus}$$

## *Calculation of Tubular Reabsorption/Secretion*

A.  $GFR \cdot P_s > V \cdot U_s$  substance reabsorbed

B.  $GFR \cdot P_s < V \cdot U_s$  substance secreted
