Total hip arthroplasty

Z. Rozkydal

Hip joint

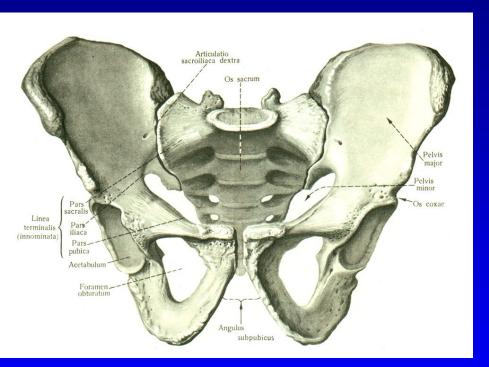

Enarthrosis

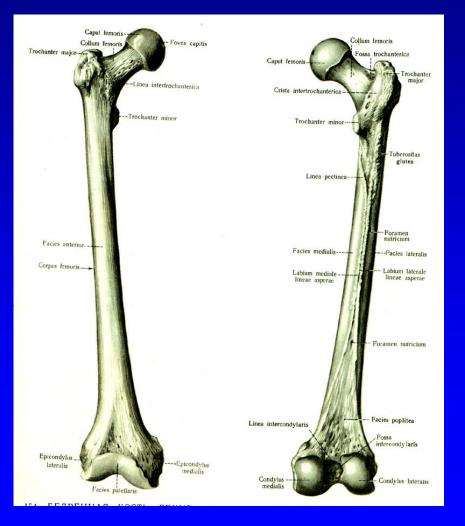

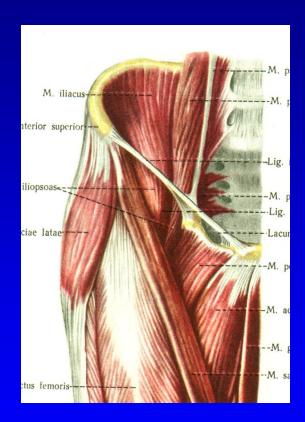

Pelvis

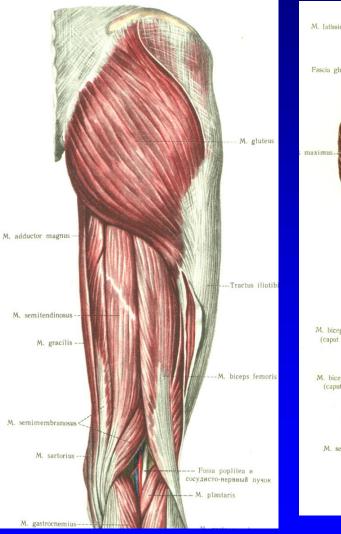

Femur

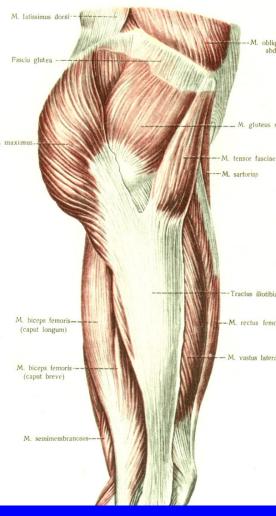

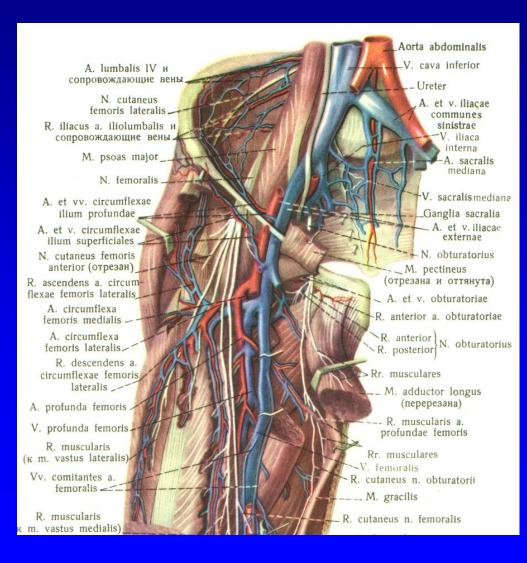

Muscles

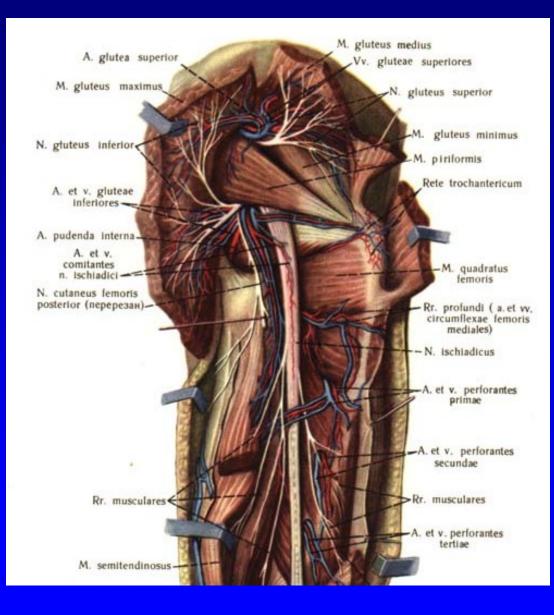

Femoral nerve

Sciatic nerve

Indication for THA

Painful condition

 + unsuccesful conservative treatment

Dyscomfort

Indications

Primary osteoarthrosis

Secondary osteoarthrosis: congenital, posttraumatic, after infection

Revmatoid arthritis Psoriatic arthropathy

Avascular necrosis of the femoral head

Primary osteoarthritis

Historie

Sir John Charnley Low friction arthroplasty Acrylic dental cement

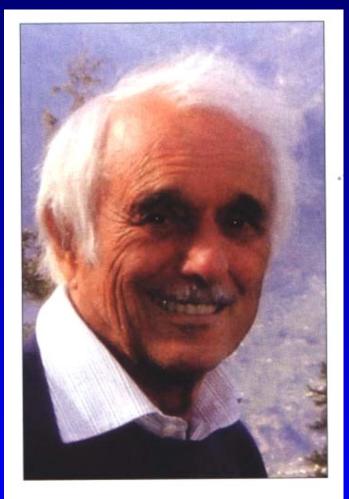

Polymethylmetacrylate – bone cement

Low friction arthroplasty

1962

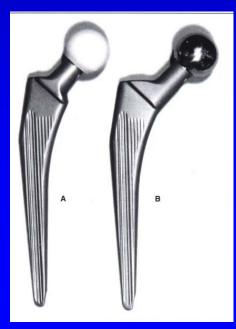

Prof. M. E. Müller

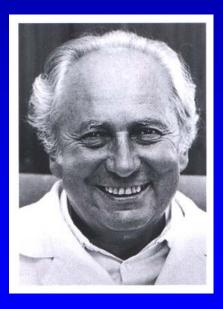

1964 -1965 Setzholzprothese

1966 Banana - shaped

1977 Geradschaftprothese

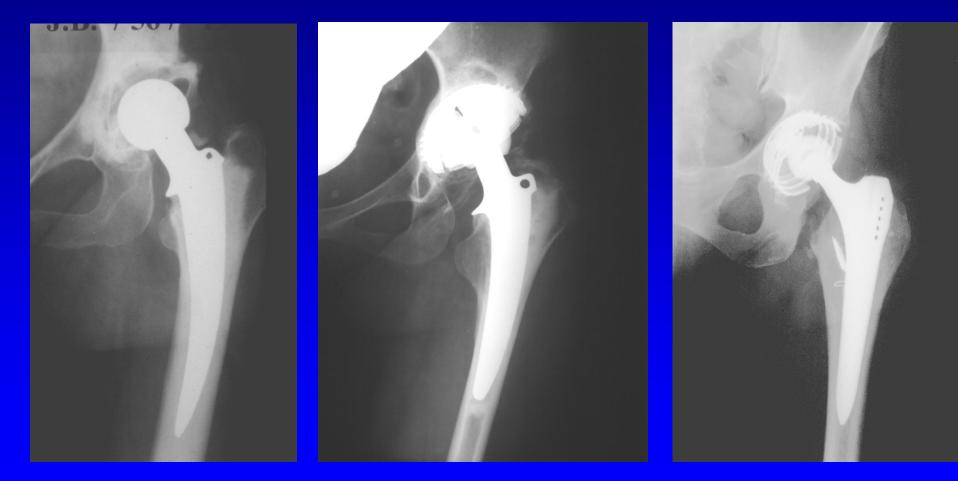

Stems Poldi- Čech

Prof. MUDR.Oldřich Čech, DrSc.

Fixation in the bone Types of THA

Hybrid

Uncemented

Primary THA

Polyethylene cup

Head Neck

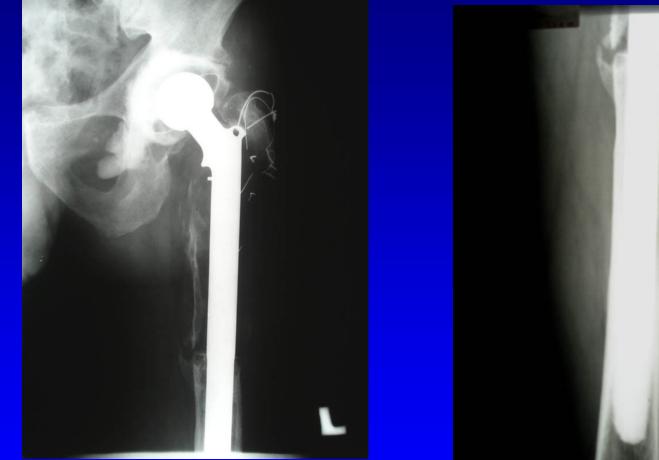

Stem

Revision THA

For tumors

Femoral head prosthesis Thompson

Steel

 Cobalt - chromiummolybdenum alloys

Titanium alloys

Polyethylen

• UHMWPE :

ultra- high- molecularweight- polyethylen

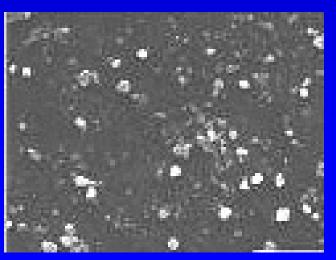

Polyethylen

- Linear wear 0,1 0,2 mm / year
- Volumetric wear 0,3 10 mg / year
- Cold flow plastic deformation
- Abrasion and delamination
- Oxidative degradation
- Modern trends: highly crosslinked polyethylen
- with vitamin E

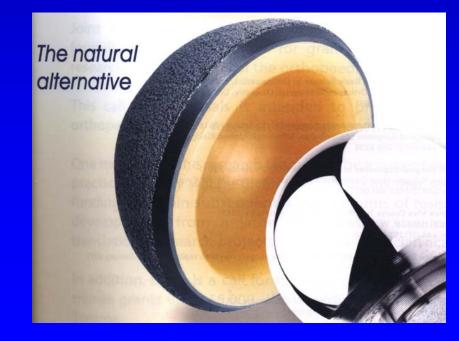

XPE- highly-cross-linked polyethylen + vitamin E

Antioxidant

Increases mechanical properties of PE

Ceramic

- Corundum or Zirconium AL₂O₃
- Smooth surface
- Less wear: 0,005 0,15 mm / year

Ceramic

Smoother surface

Less ammount of wear of particles Particles are bioinert

Wear of head/PE cup under 0,15 mm/ year

Wear of ceramic head/ceramic insert under 0,002 mm/ year

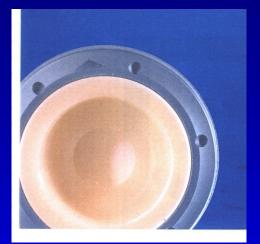

Contact : head - cup

- Metal- polyethylen
- Ceramic- polyethylen
- Ceramic -ceramic

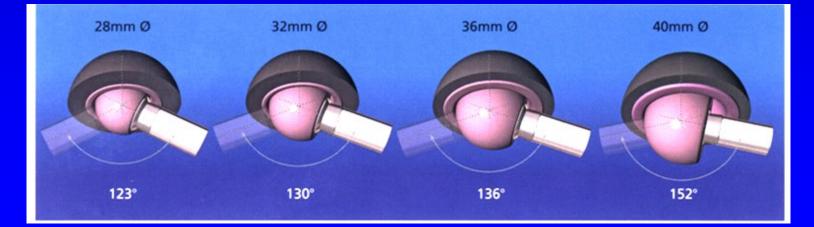

Diameter of the head

22, 28, 32, 36, 38, 40 mm

Advantage of 36 mm head:

Higher stability Greater range of motion Less impingement neck- edge of the cup

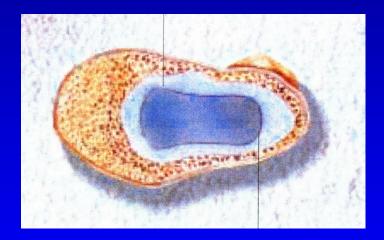

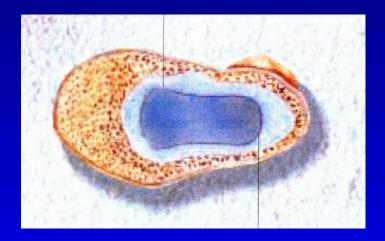

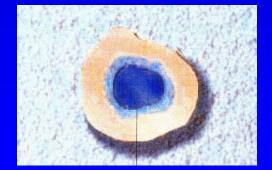

Bone cement

- Polymethylmetacrylate
- Powder polymer, fluid monomer
- Exothermic reaction 83-100 C
- Hardening in 10 min.
- Adverse effects: hypotension, coagulation of proteins, cytotoxicity

Cemented THA

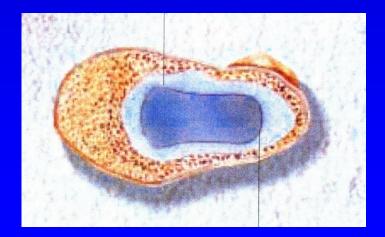

Cementing technique

- Interdigitation into bone trabeculae
- Regular layer: under the cup 3 mm around the stem 2-7 mm

Acetabular component

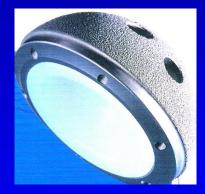

• Cemented: polyethylen

Noncemented: metal- backed

with PE insert

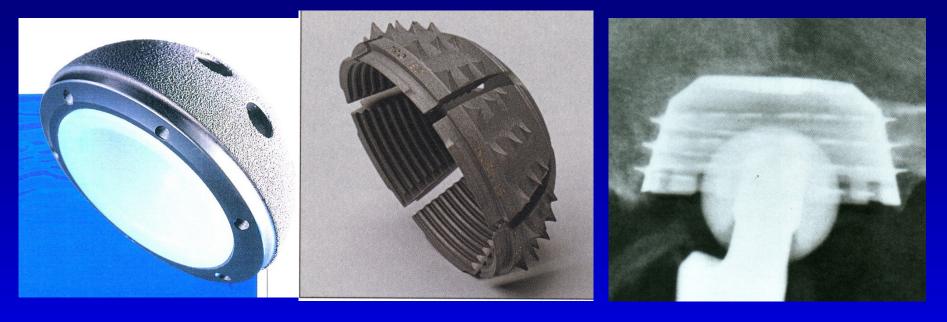

with ceramic insert

Uncemented cup

Press - fit

Expansion

Threaded

Primary fixation: mechanical anchorage in the bone

Uncemented cup

Secondary fixation: osteointegration of the implant on the surface of bone

Surface of cementless implant

Macroporosity

Microporosity

Pores on the surface 5 µm - 600 µm

Pores above 800 µm- fibrous tissue

Adhesive surfaces: Trabecular Metal Trabecular Titan Pores 300 µm High initial stabilty

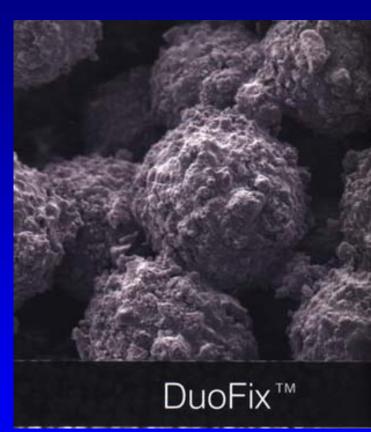

Hydroxyapatite surface

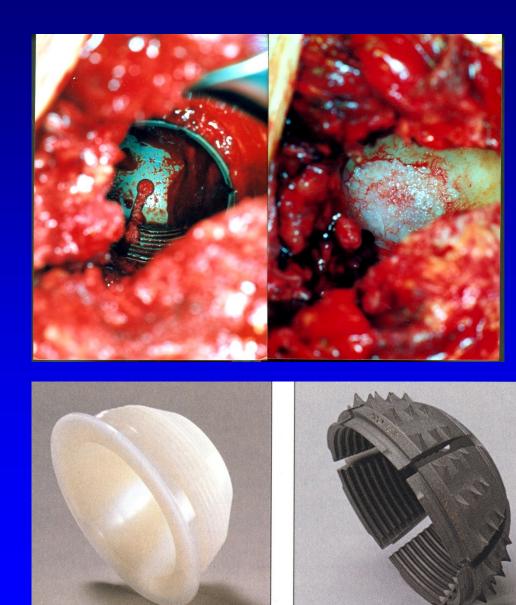

Bioactive

Osteoconductive

Chemical bonds bone- hydroxyapatite

Expansion cup- CLS

Bicon – Zweyműller cup

Femoral component

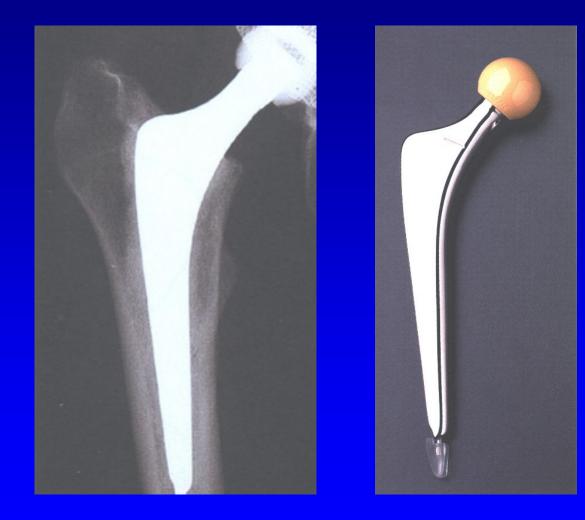

- High polished surface for cementing fixation
- Porous surface for cementless fixation

Cemented

Cementless

Morscher, Spotorno MS – 30 stem cemented

Uncemented stems

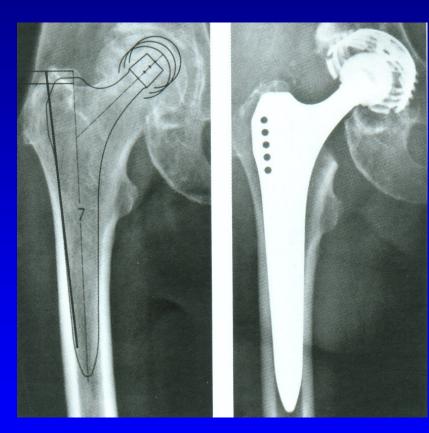

Proximal fixed

Distal fixed

Uncemented stem

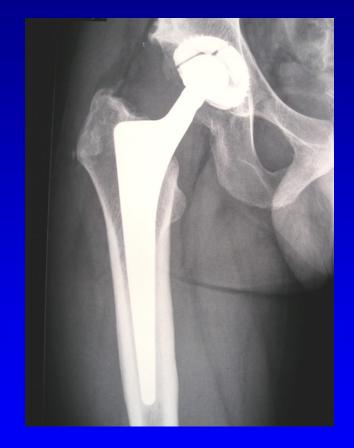

- Primary fixation:
- Mechanical anchorage in the bone
- Secondary fixation of the implant on the bone surface

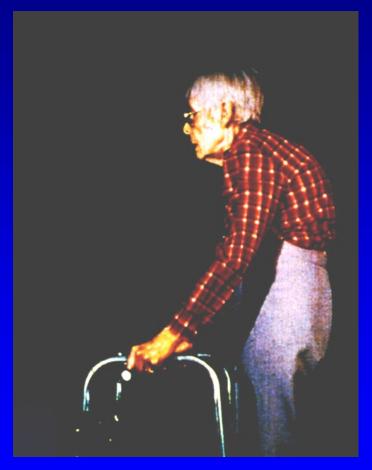

Prerequisity for good result

Choise of the patient **Preop.** examination **Prevention of infection** Choise of the implant **Operative technique** Postop. management Activity of the patient **Regular follow- up Prevetion of infection** Prevention of aseptic loosening

Contraindication

- Active infection of the hip
- Infection in the body
- General condition not good
- Neurogenic arthropathy
- Extreme low bone quality
- No cooperation of the patient
- Relative: age over 80 y. elevated ESR

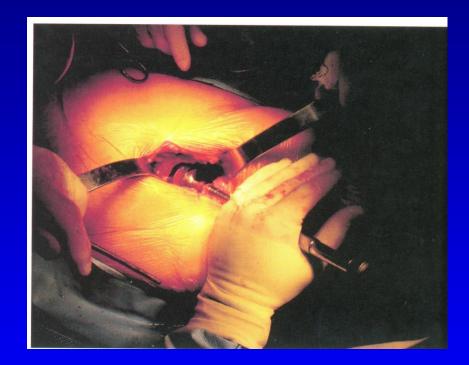

Approaches

MIS- mini invasive surgery

Physiotherapy

- 1. In bed
- 2. Sitting, drainage ex
- 3. 5. walking
- 6. + stairs
- 7-21 in physiotherapy dpt.3 months- spa resort

Full weight bearing. Cemented THA after one month Uncemented after 12 weeks

Fast track physiotherapy, discharge 3-4 days, home care

Operative technique

Femur – brush pulsatile lavage sealing of medular cavity prox.- dist. drainage of the femur

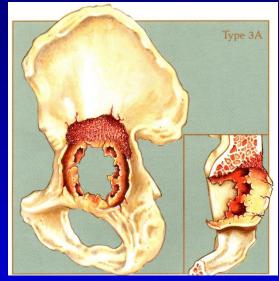

Vacuum mixing of bone cement

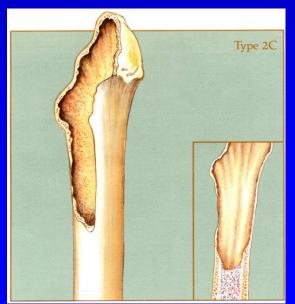

Pressurisation of bone cement

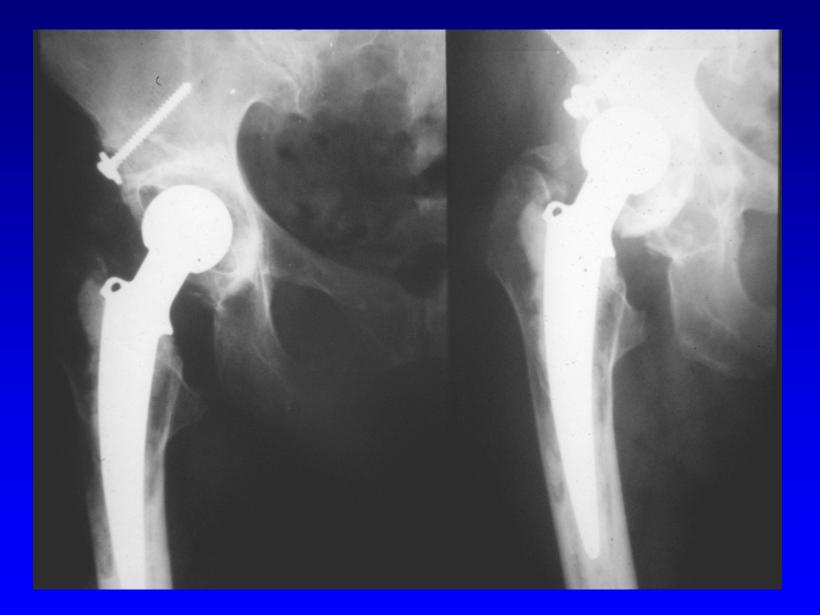

Timing of insertion of the stem

Continuous pressure

Revision THA

Revision of the acetabulum

Revision THA

Periprosthetic infection

St. aureus St. coagulase negative Streptococci Enterococci, others MRSA, MRSE Polyresistant G- bacteria

Biofilm

Biofilm

Adhesion of bacteria - reversible

Exopolymers

glycolalyxextracelular matrixirreversible

Releas to surrounding tissue

Periprostetic infection- diagnostics

Clinicly Labor: CRP, leu, ESR aspiration of pus X-ray- osteolysis, loosening USG (abscesus) **Scintigraphy** Sonication of the implant **Bacteriological** examination Long cultivation

Periprostetic infection- PPI

Acute PPI

Chronic PPI

Late haematogenic PPI

Management

To start treatment as soon as possible: 10-14 days from the onset of symptoms

Prerequisity: cooperation of the patient

informed physician

Periprosthetic infection-treatment

Debridement One stage surgery Two stage surgery Resection artroplasty Antibiotic suppresion

Two stage surgery Better ROM Better walking Revision is easier Local concentration of antibiotics - Gentamycin a Vancomycin - Cover 90 % of all pathogens

Principles

Experience of the hospital Long term results National registries Operative technique Reliable implants Activity of the patient Regular follow up

Daily activity after THA

- No lifting and wearing of heavy objects No strenuous manual labor Limited running and jumping No contact sports
- Recommened sports: swimming, bicycle, tennis tourism, skiing?
