

# Endodontic treatment – from acces to the working length

# Phases of the endodontic treatment

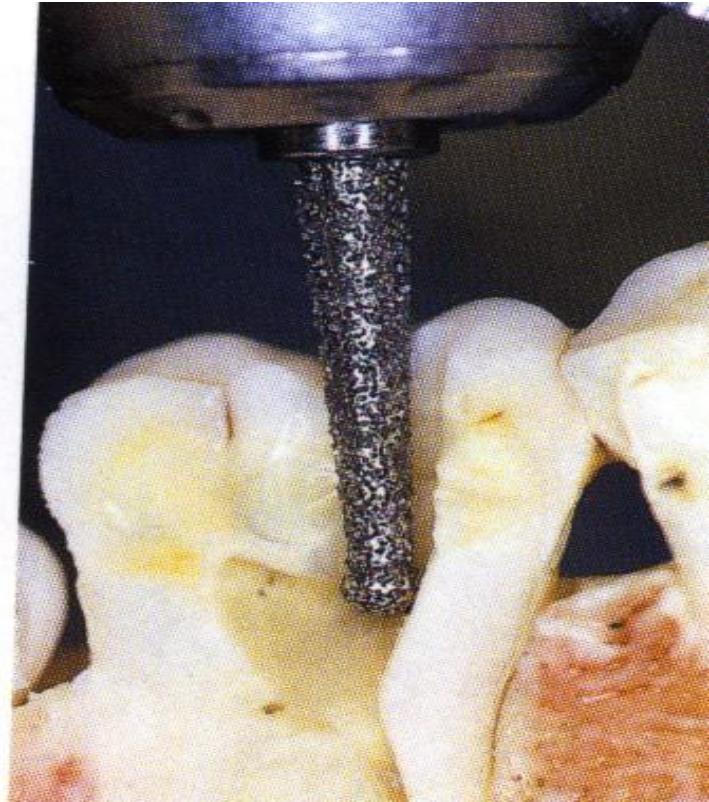

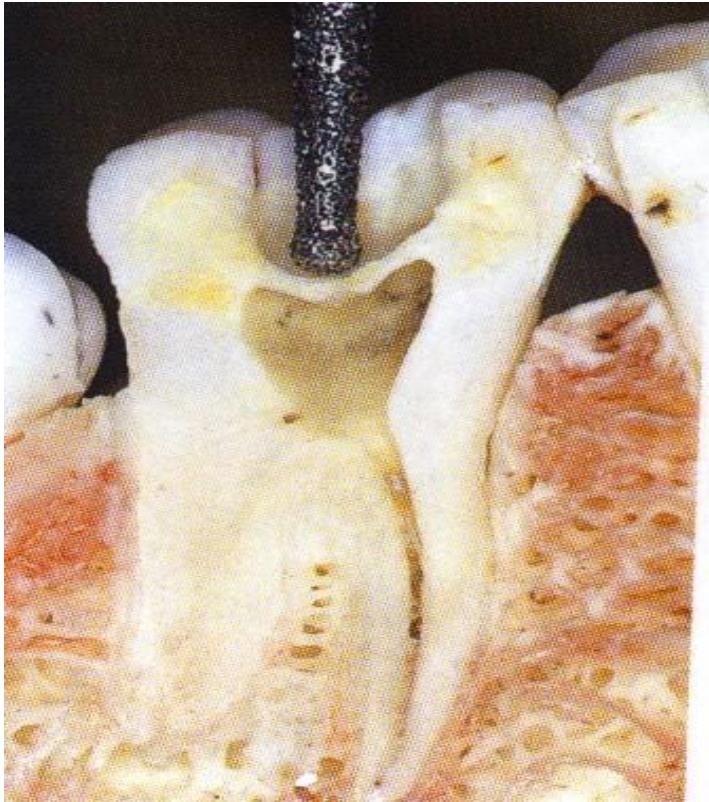

- **Investigation, diagnostic radiogram, consideration ( local, regional, systemic factors)**
- **Removal of old fillings, carious dentin, temporary restoration - contours of treated tooth.**
- **Dry operating field**
- **Preparation of the access (endodontic cavity)**

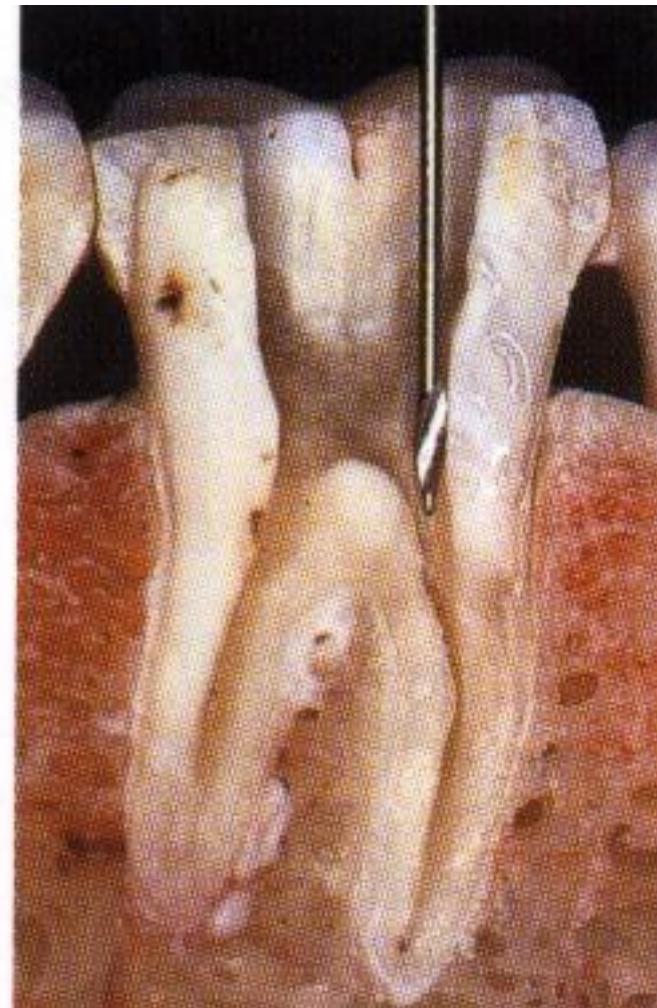

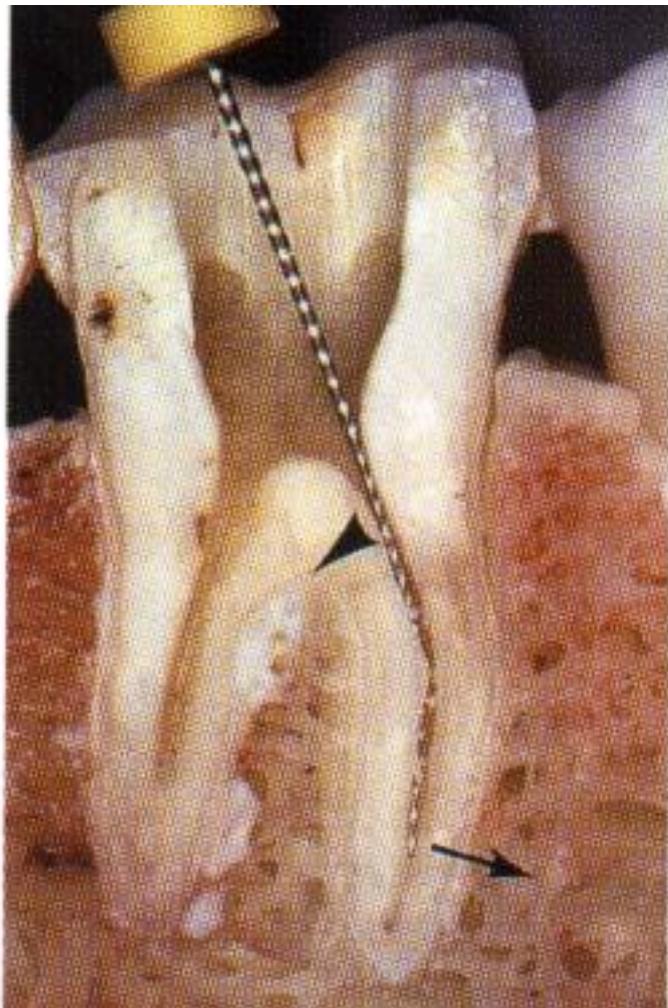

# **Phases of the endodontic treatment**

- **Opening of root canals**
- **Initial flaring and removal of content of root canal**
- **WL (working length)**
- **Root canal shaping and cleaning (irrigation)**
- **Rekapitulation**
- **Drying**
- **Filling**
- **Radiogram**
- **Postendodontic treatment**

# Access

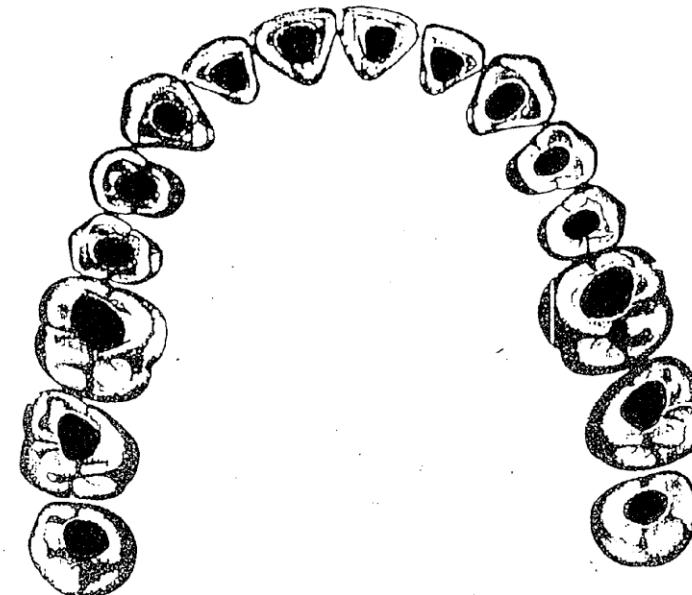

## Opening of root canal orifices

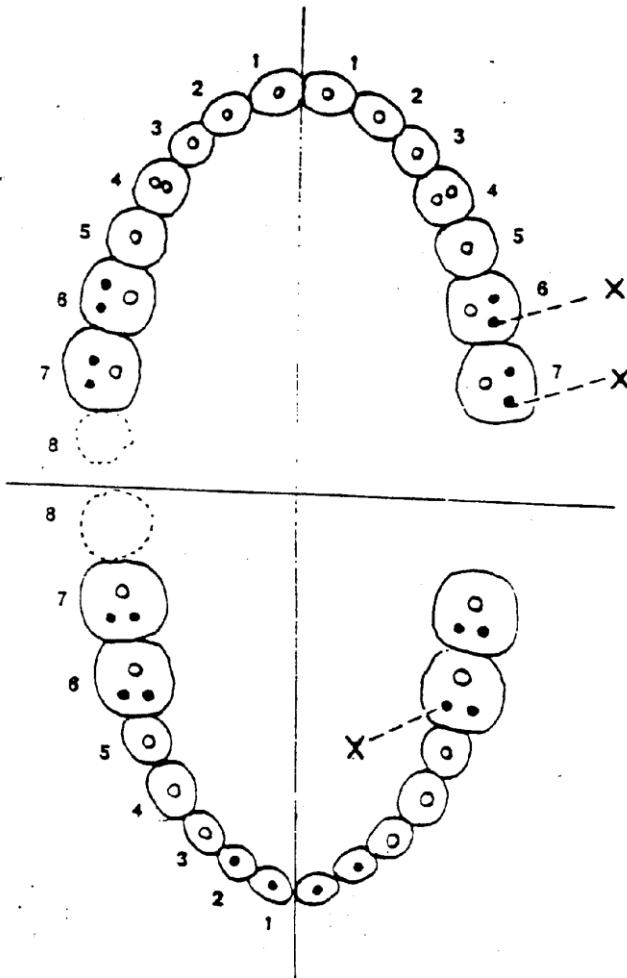

Shapes of endo cavities

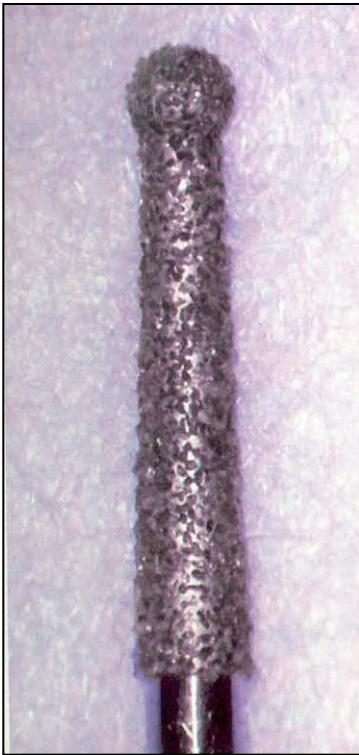

See special material on is

Number of root canals  
First upper molar – 4 root canals

Insertion  
Rotation  
Exstirpation

# Canal shaping

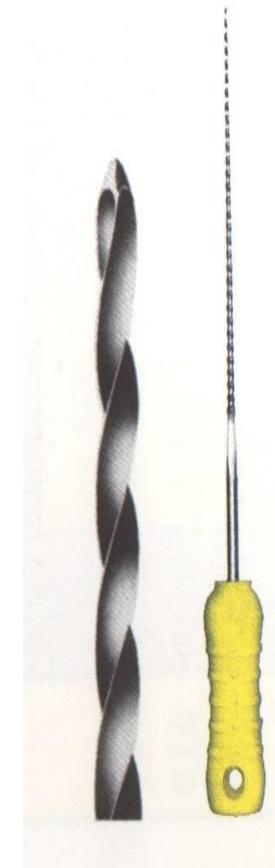

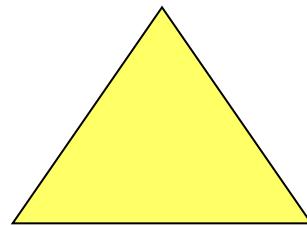

- Reamers (penetration)
- Files ( shaping)

# Reamer

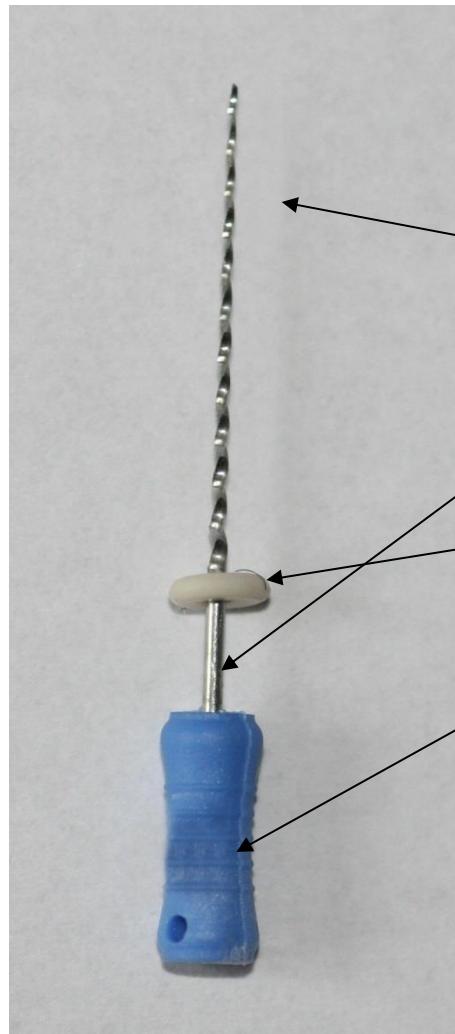

**K -reamer**

**Triangl or square wire spun**

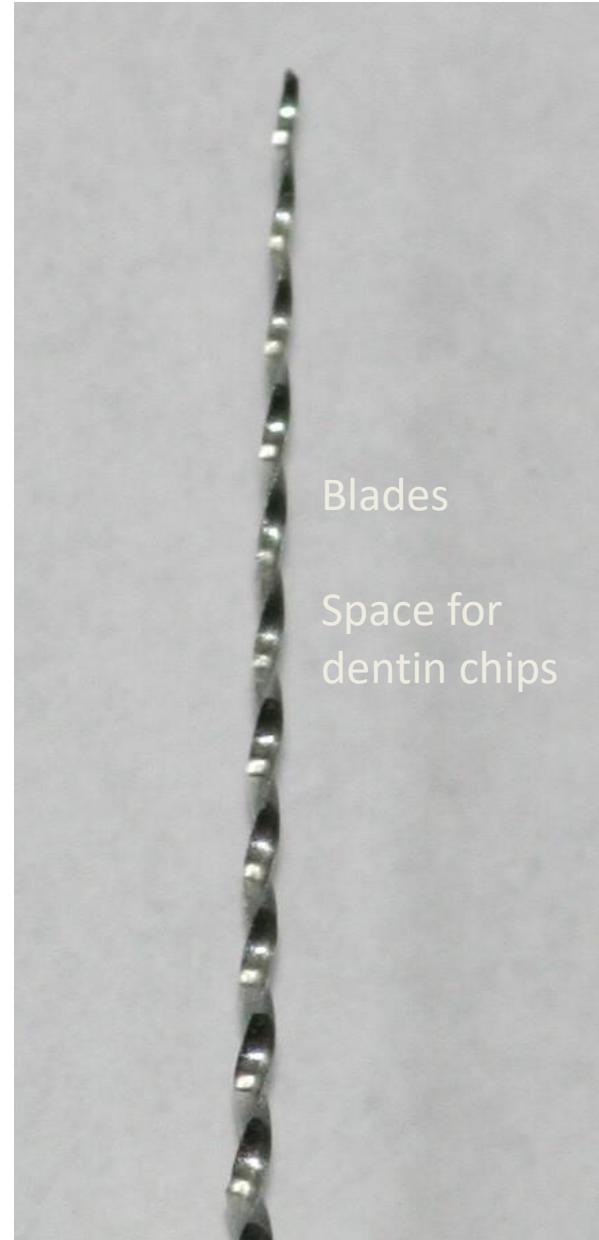

**Symbol**

# Reamer

Blades  
Space for dentin chips

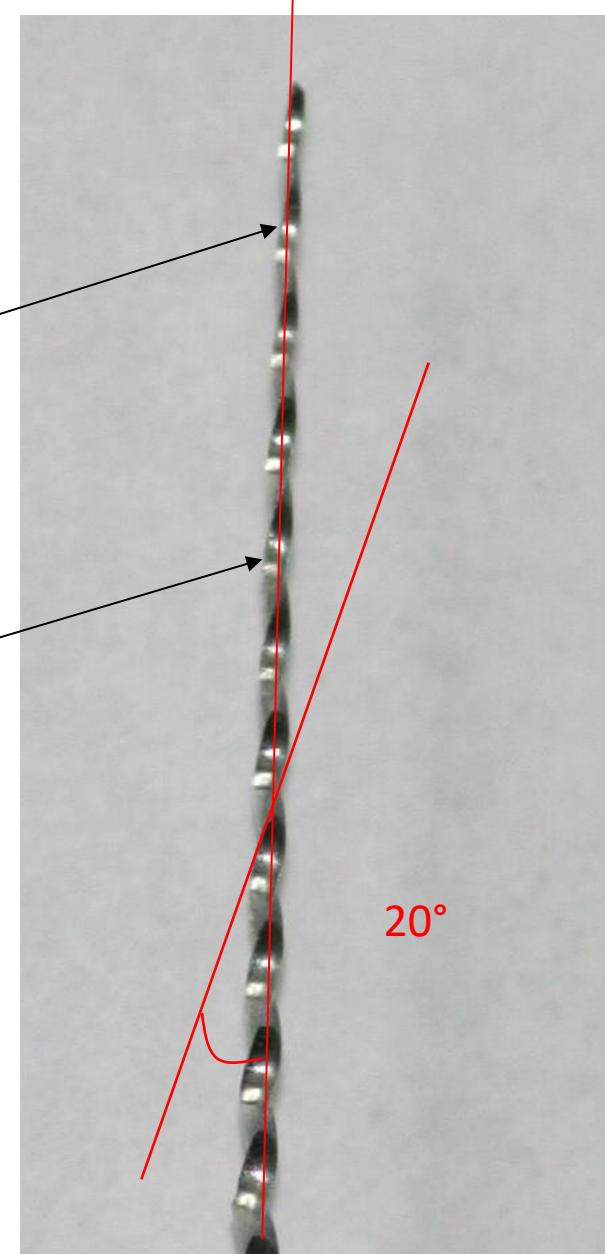

# Reamer

Blades

Space for dentin chips

***Rotation – reaming action - penetration***

# Reamer

**Rotation (clockwise) – penetration**

**Application of plastic material  
(counterclockwise)**

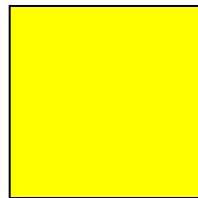

# Files

- 1. K-file**
- 2. K-flexofile, flexicut, flex-R**
- 3. K-flex**
- 4. H-file, S-file**

# K file

Wire triangl or square

Symbol is always square

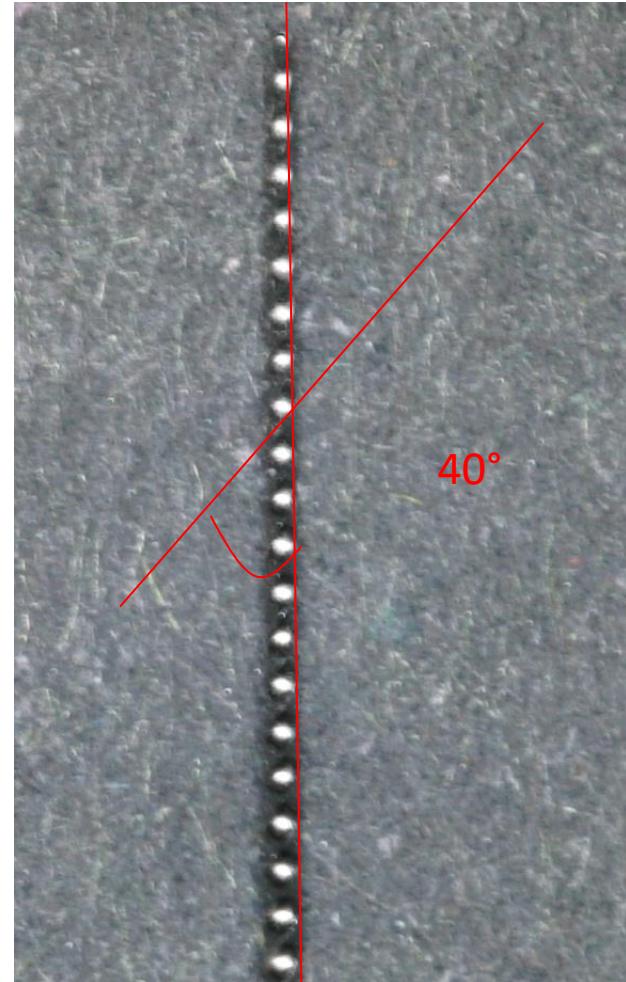

# K-file

*Filing*

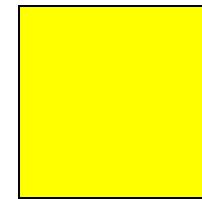

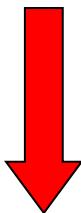

*Also rotation*

$45^\circ - 90^\circ$

# K-flexofile, flexicut, flex-R

- Triangle wire always

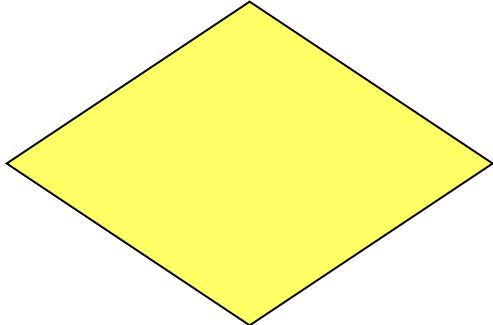

Flexibility

K- flexofile a flex – R file: non cutting tip and first blades are blunt

Like K-file

# K- flex

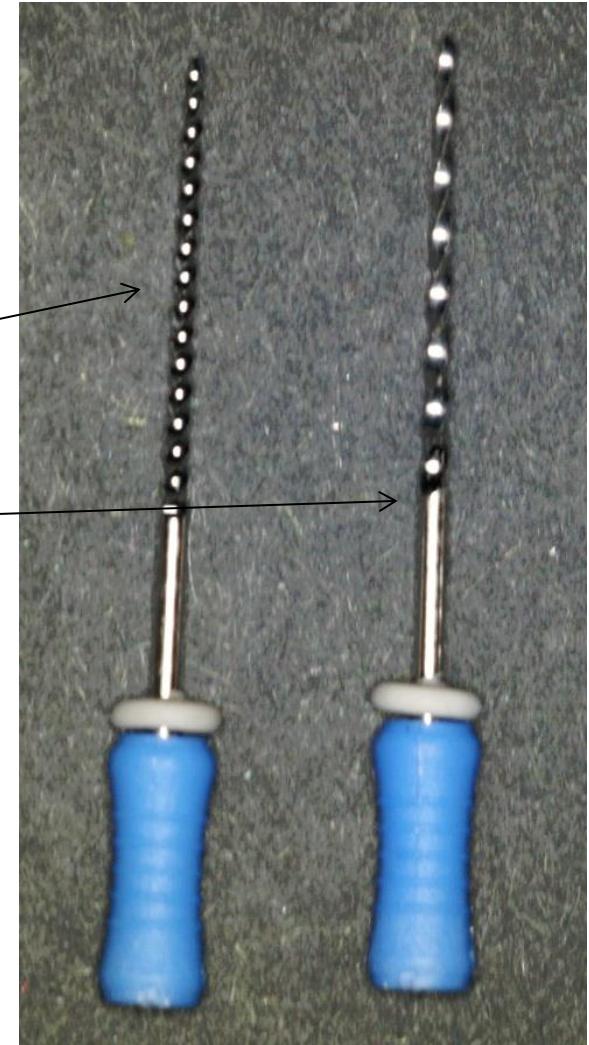

Rhombus

Two blades in action

Enough space for dentin chips

Flexibility, effifacy

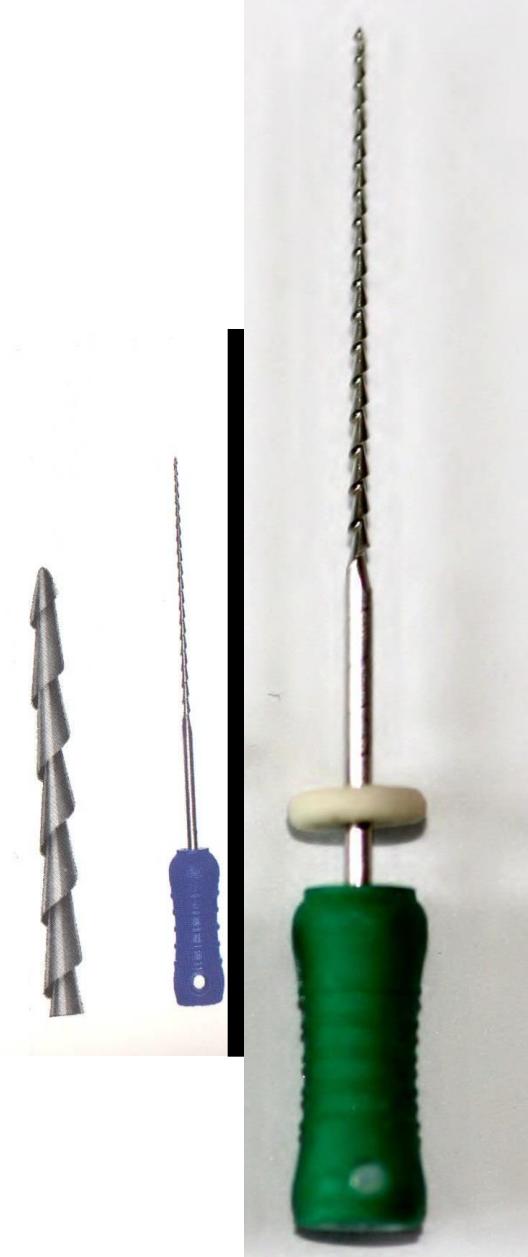

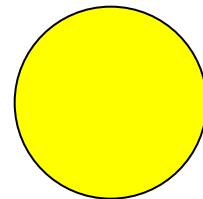

**K-file and reamer:  
the difference**

# H-file

= Hedstroem file

Ring

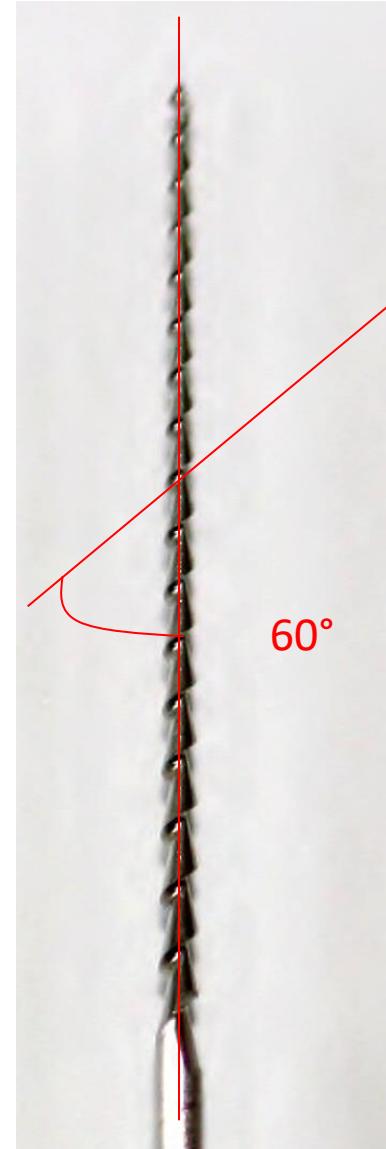

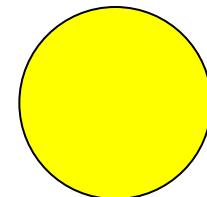

# H- file

No rotation!!

Pull motion only!!

Risk of breakage in small sizes

# ISO

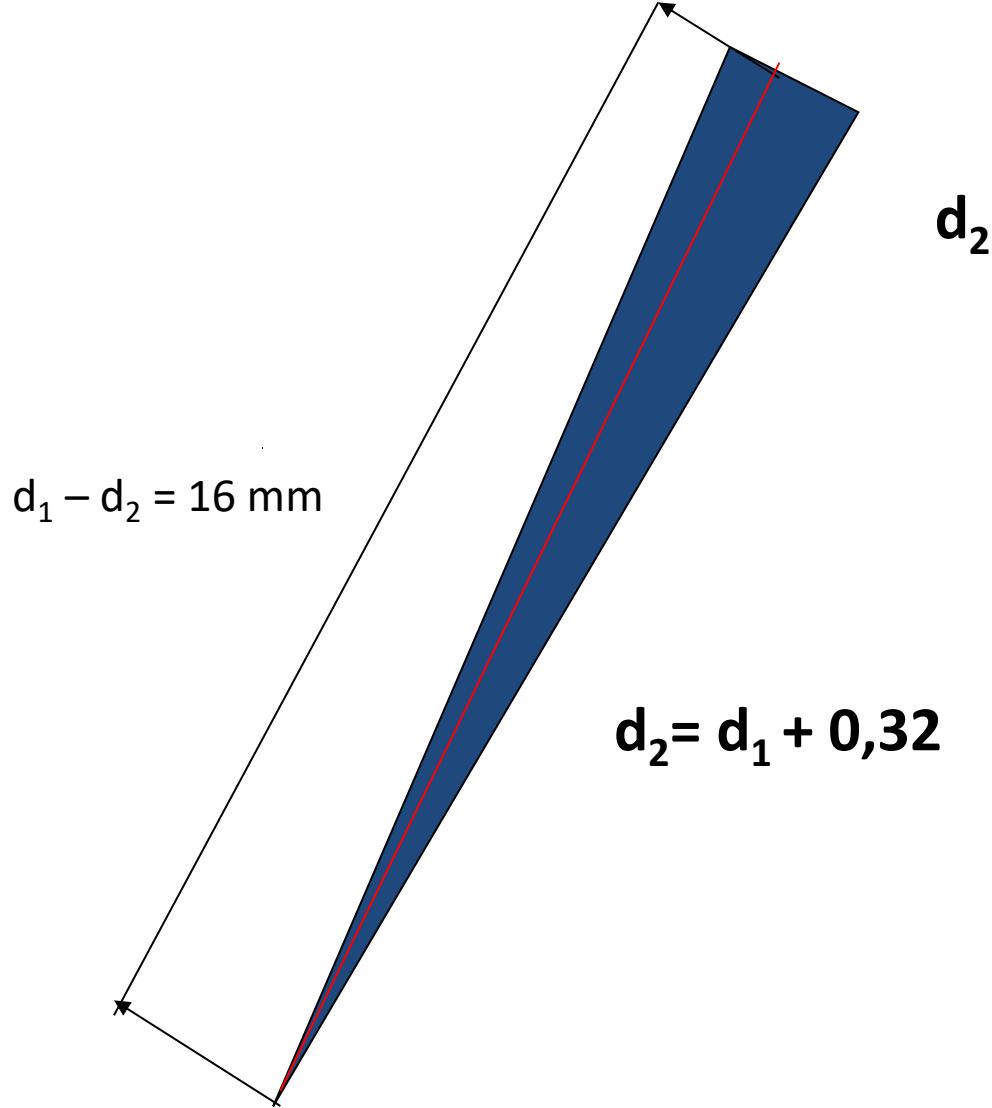

- Diameter of the tip
- Length of the cutting part
- Taper

# Working length

- Distance between the referential point and apical constriction
- Radiographically
- Apexlocators
- Combination

# Why apical constriction

- Small apical communication
- Minimal risk of damage of periodontium
- Prevention of overfilling
- Prevention of extrusion of infection
- Good decontamination
- Good condition for root canal filling

# Radiogram

X-ray with inserted root canal instrument

Safe length: average length of teeth reduced for  
2 – 3mm

Tooth with clinical crown

# Safe length

Average length of the tooth less 2 mm

- Maxilla:

I1 20

I2 18

C22-24

P20

M 18 mkk,20 P

# Safe length

Average length of the tooth less 2 mm

- Mandible

I 18

C20 -22

P18

M18

# Procedure

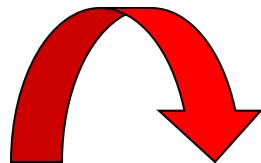

- Instrument ISO 15 inserted into the root canal, stop at the referential point
- Estimation of location of apical constriction (1 – 1,5 mm distance from x-ray apex.

If difference in the radiogram more than 23 mm  
- repeat

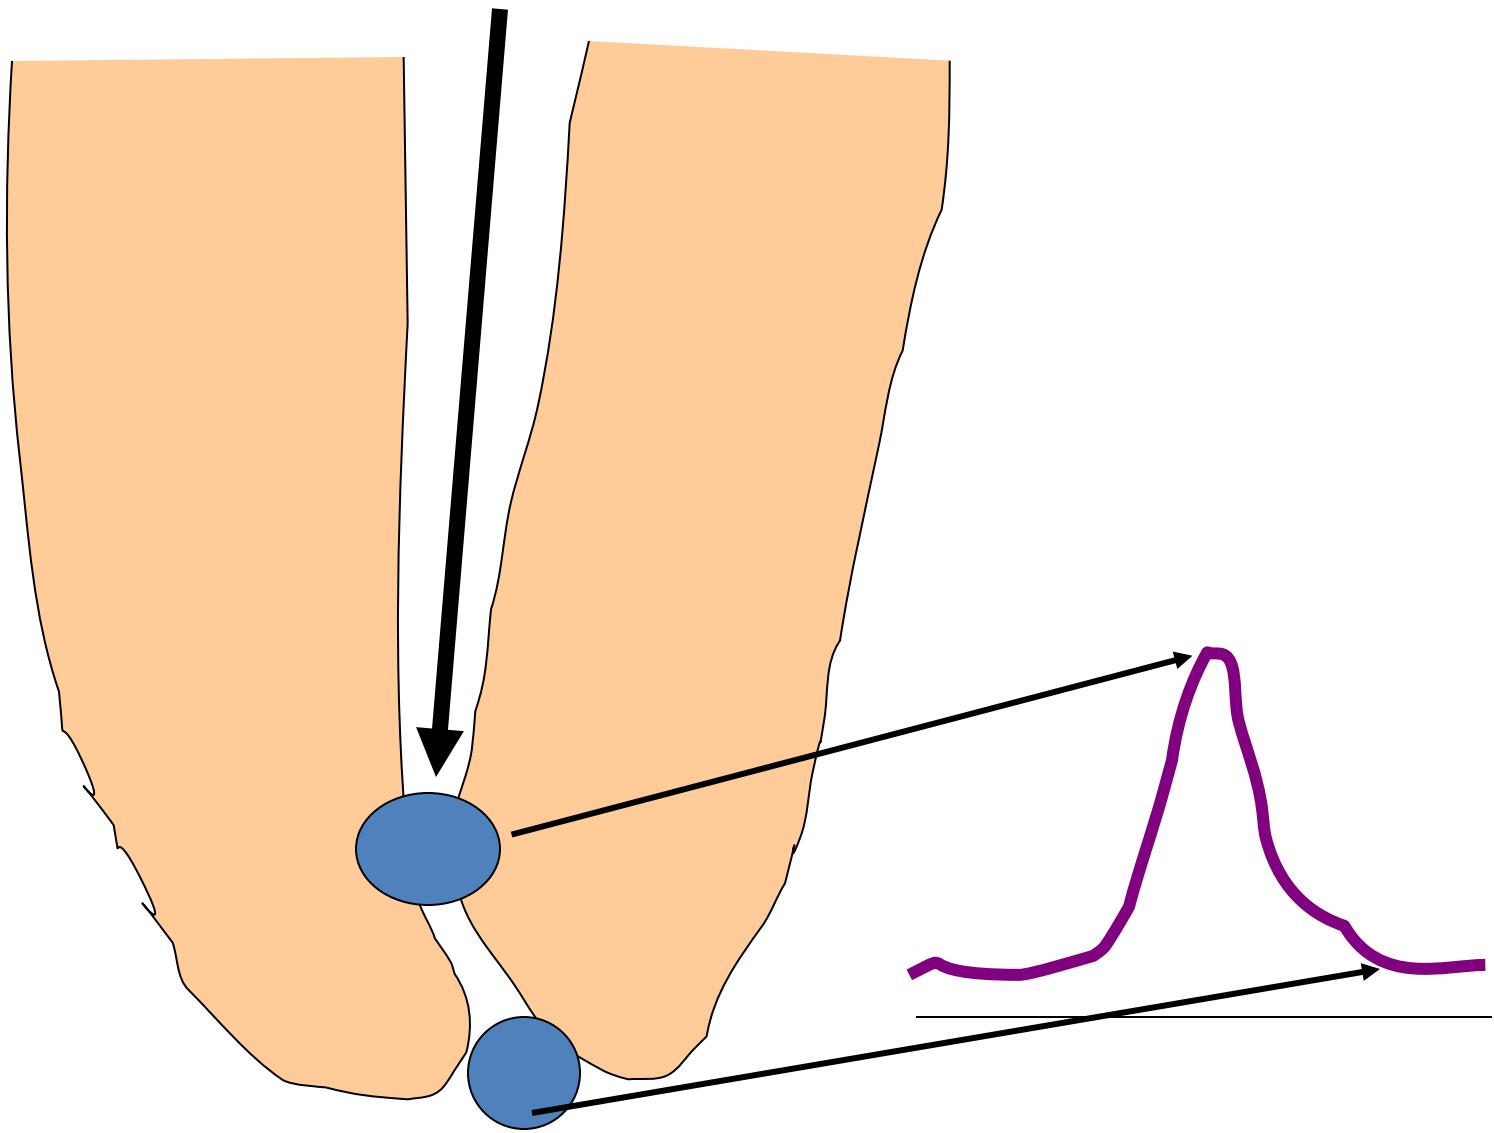

If 2 mm or less – add to the safe length

# Endometry, odontometry

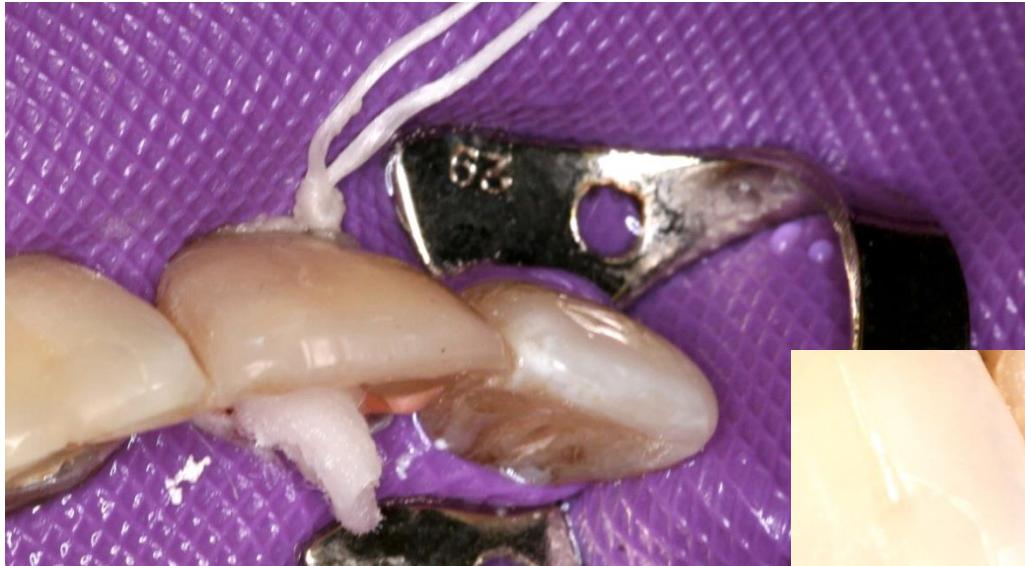

- Endometry

**e**devices based on measurement of electrical resistance

$\mathcal{LR}$

LR

# RAYPEX® 6

# Methods of shaping

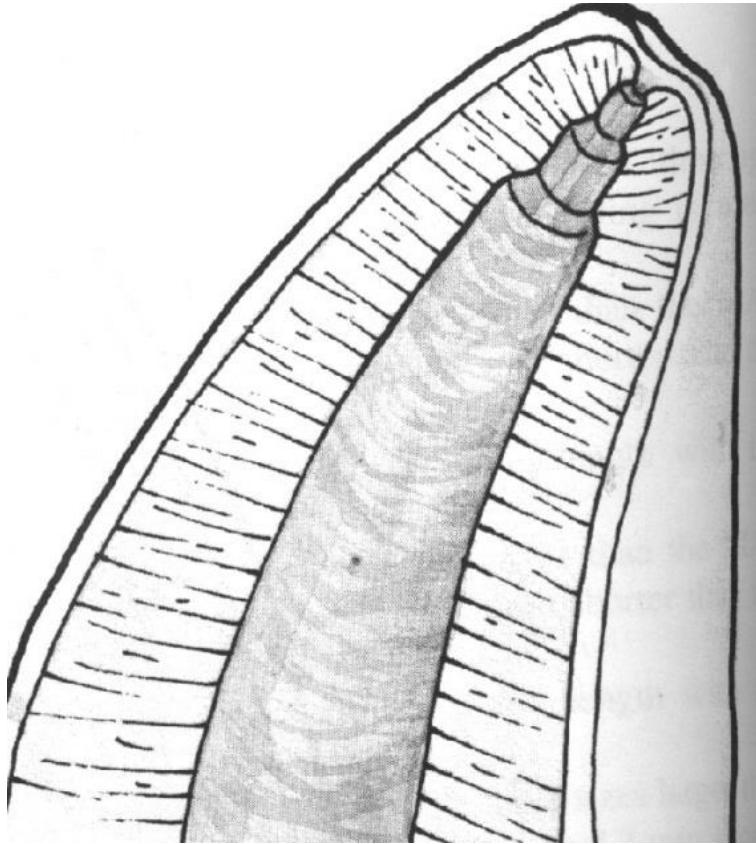

- Step back method

Increasing size with decreasing length.

Insertion of root canal instrument – WL

Next – 1 mm shorter

...

Taper  
Final flaring with  
the smallest instrument

H- File nebo K - Flexofile.

# Method modified double flaerd

- I. Opening of root canal

- Coronal third

- II. Apical preparation

Cathetrization, measurement, shaping till ISO 30 – 35 balanced force. Master file – MAF (till WL)

- III. Step back

- Final flaring (MAF)
