

Obnova bodu kontaktu pomocí sekčních matric

Petr Šikula, Stomatologická klinika
FNUSA

A grayscale close-up photograph of a person's teeth and tongue. The tongue is visible in the center, partially covering the lower teeth. The upper teeth are visible above it. The lighting is soft, creating a moody atmosphere.

Proč je důležitá obnova bodu kontaktu?

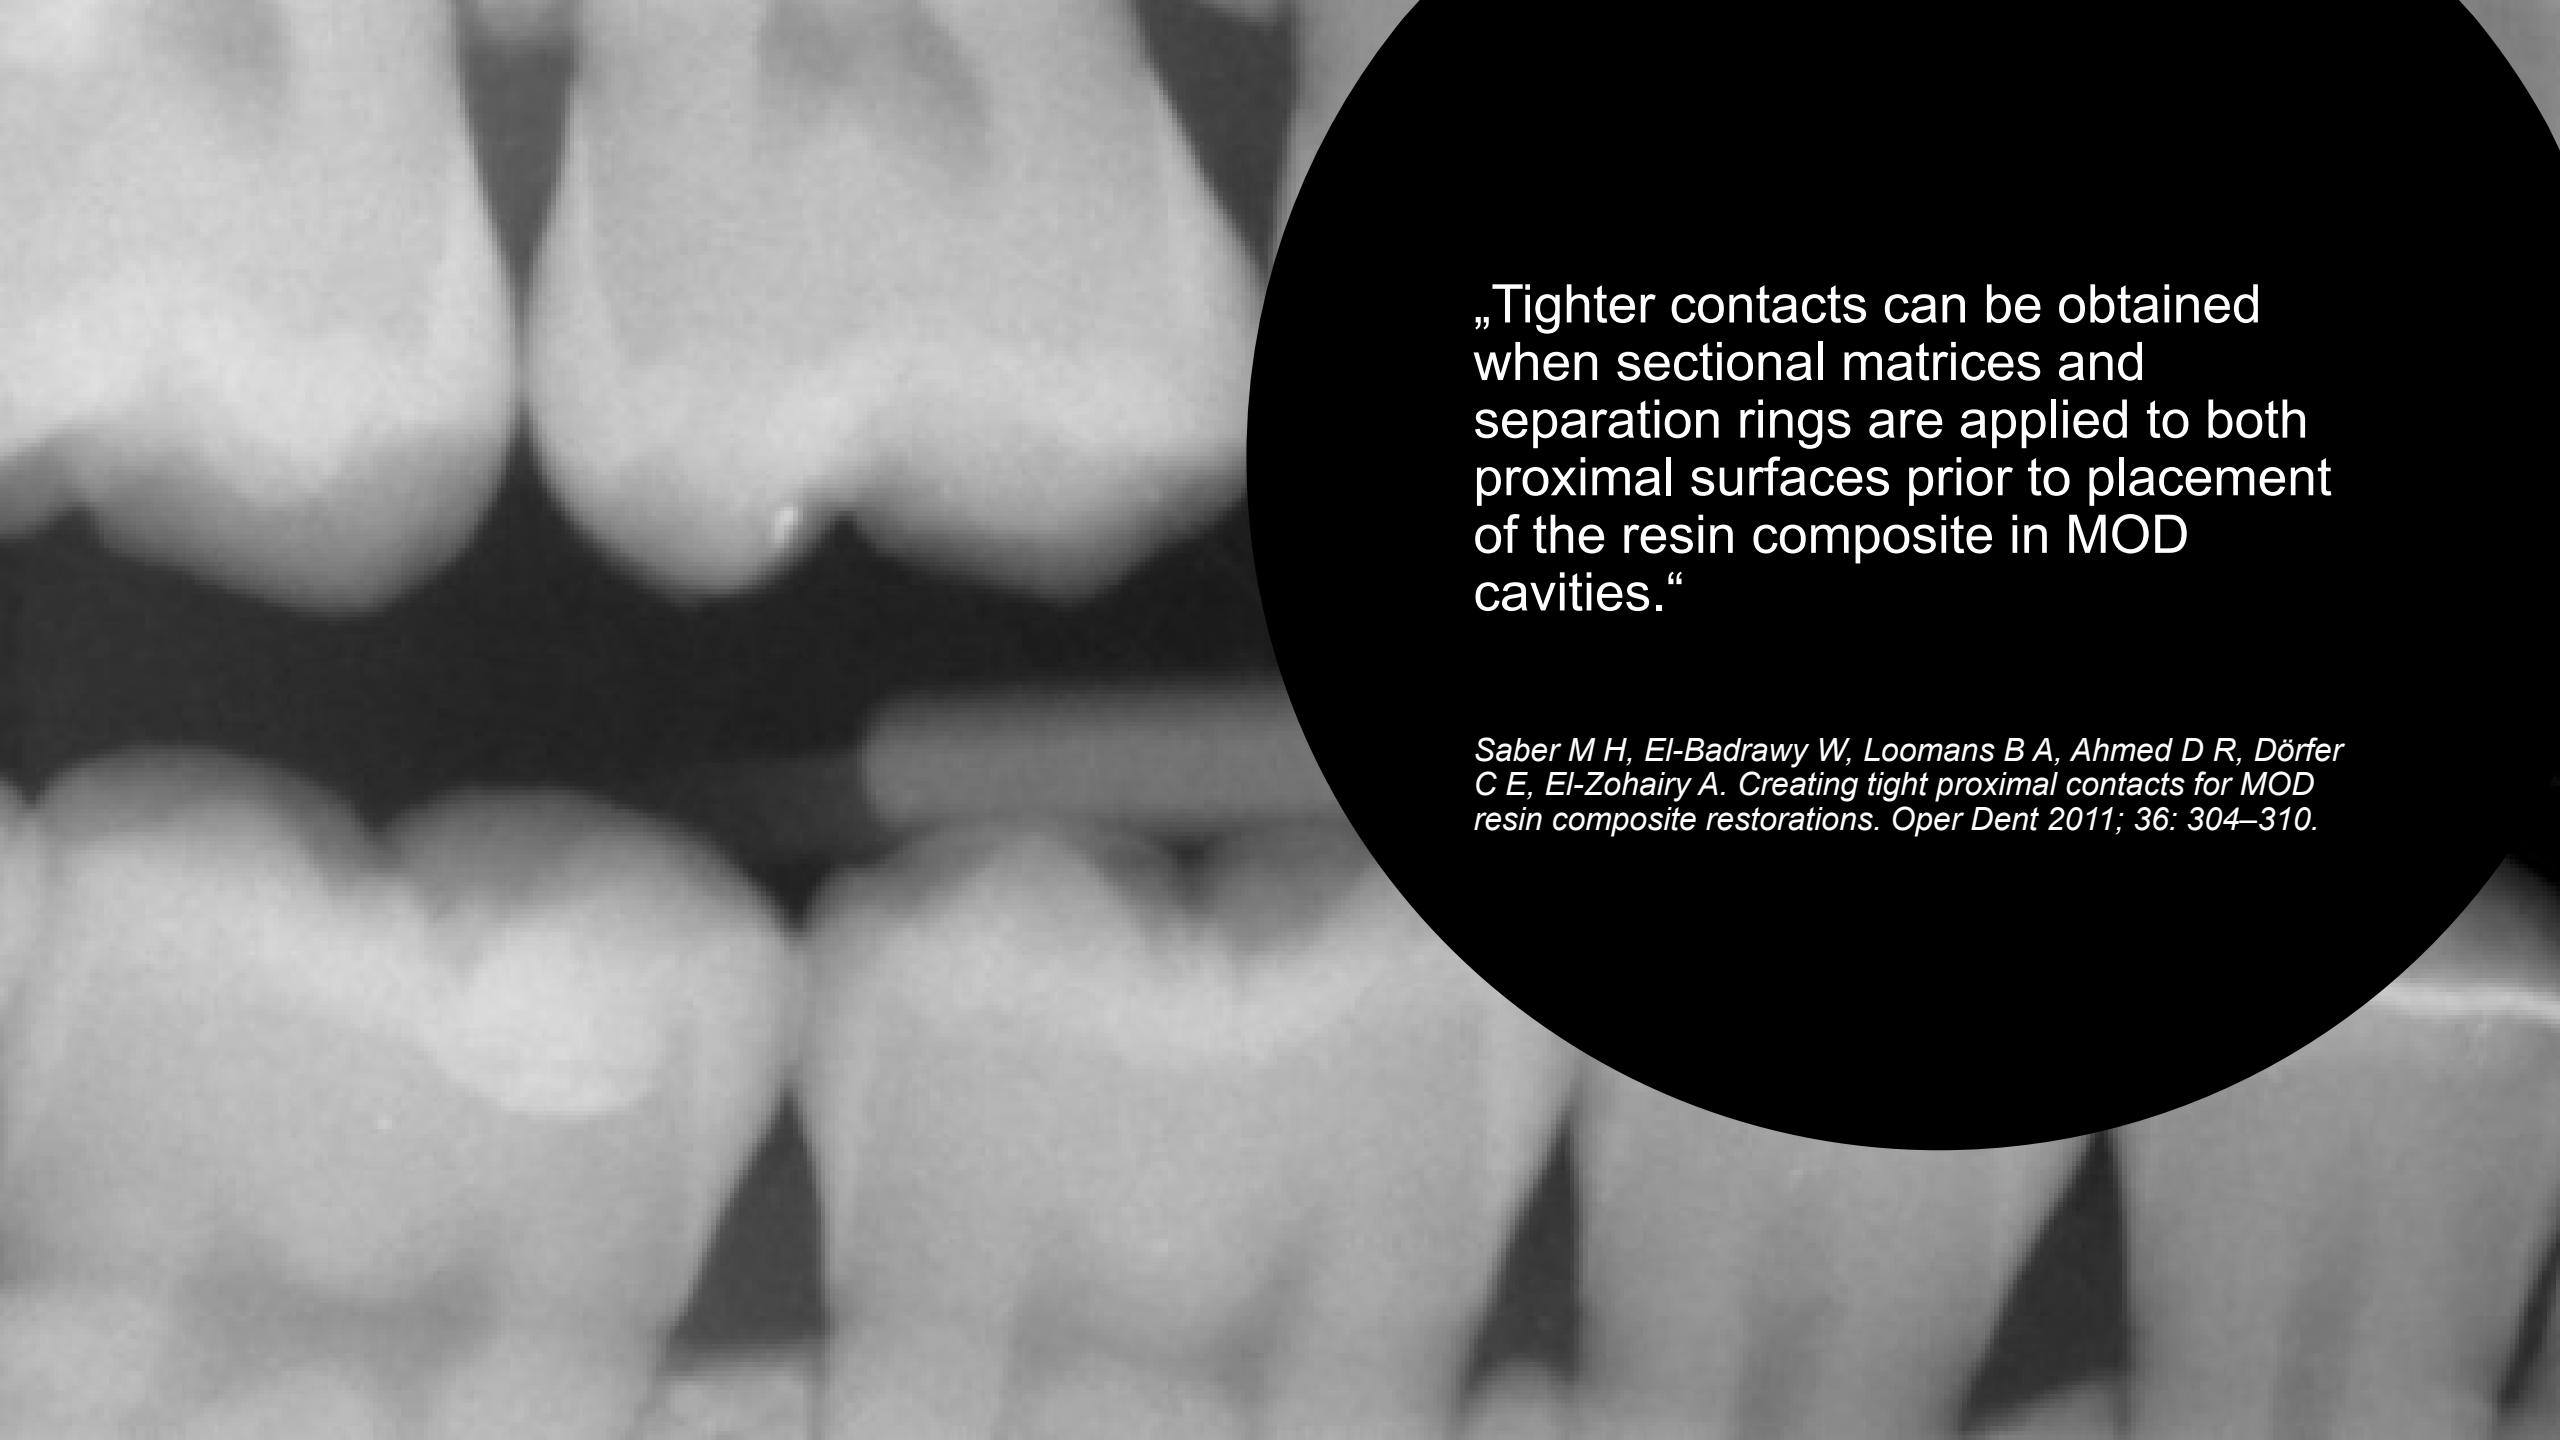

- Prevence váznutí stravy v interdentálním prostoru
- Prevence vzniku sekundárního kazu
- Prevence irritace mezizubní papily a vzniku parodontálních defektů
- Prevence sklonu, rotací a posunů zubů

„Use of the sectional matrix system in two-surface Class II cavities resulted in statistically significantly tighter proximal contacts than the use of the circumferential matrix system.

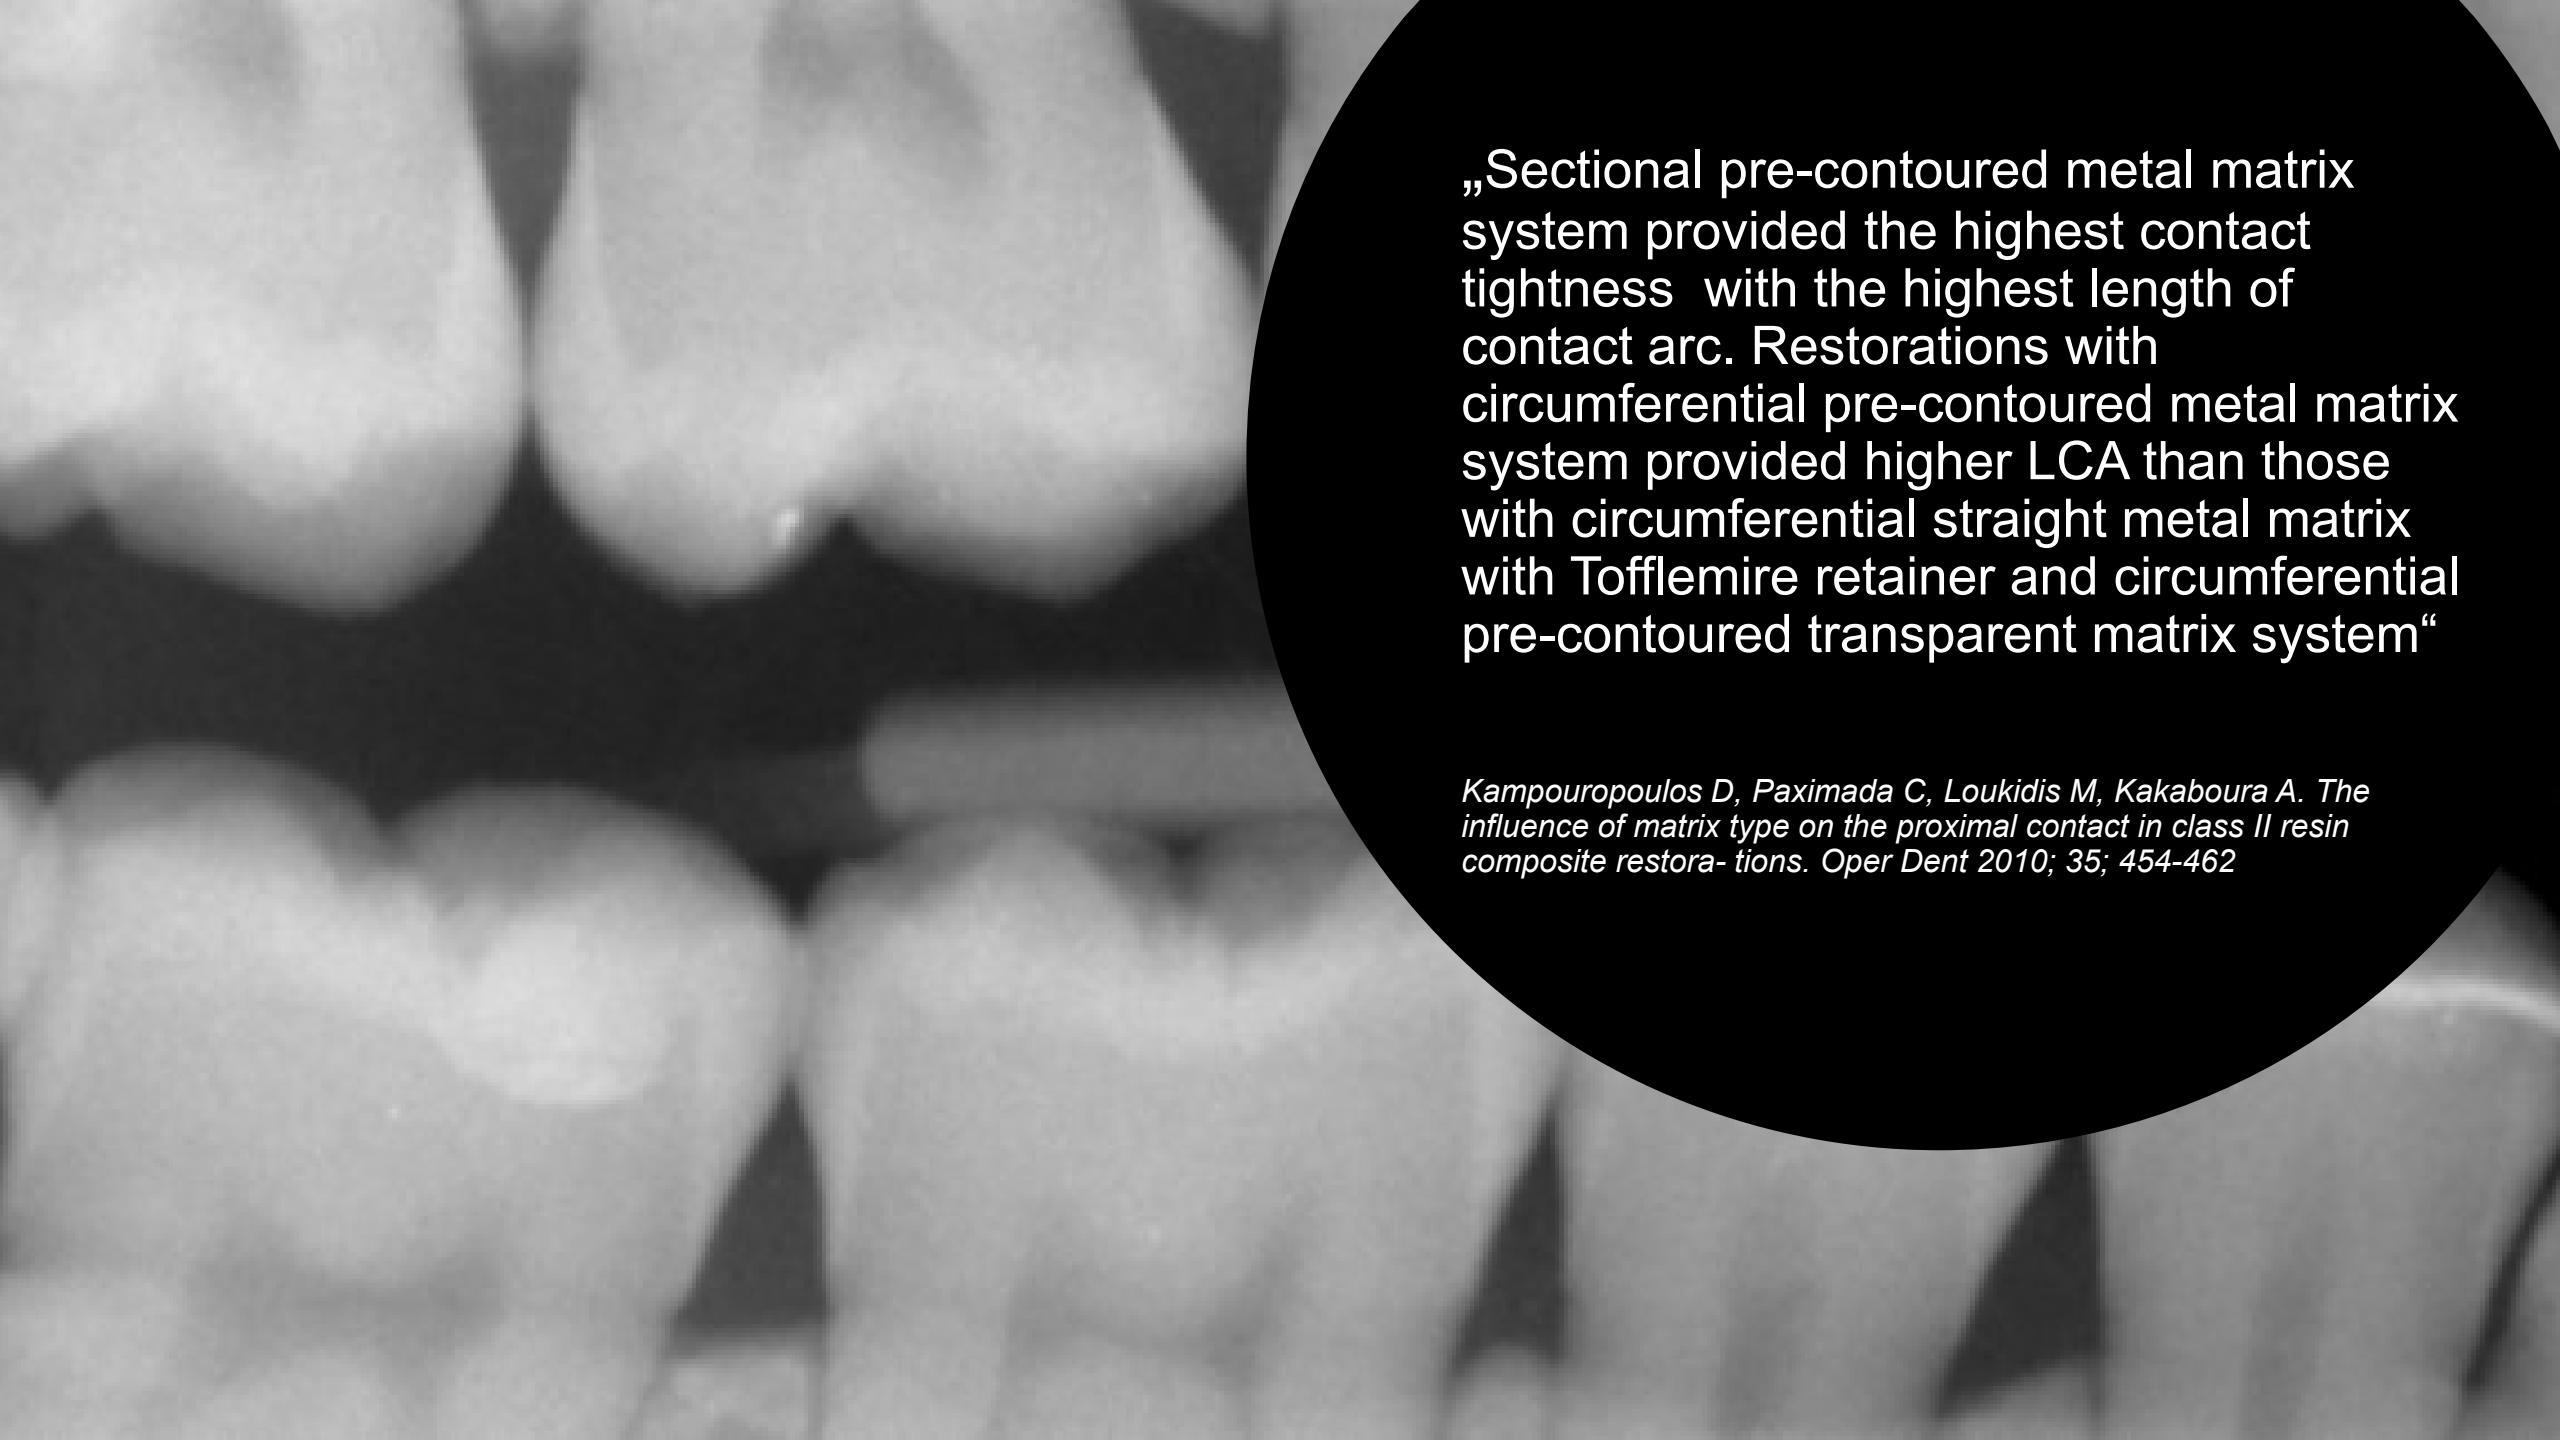

For the three-surface no statistically significant differences in contact tightness were found between the different matrix systems.“

Wirsching E, Loomans B A, Klaiber B, Dörfer C E. Influence of matrix systems on proximal contact tightness of 2-and 3-surface posterior composite restorations in vivo. J Dent 2011; 39: 386–390

„Tighter contacts can be obtained when sectional matrices and separation rings are applied to both proximal surfaces prior to placement of the resin composite in MOD cavities.“

Saber M H, El-Badrawy W, Loomans B A, Ahmed D R, Dörfer C E, El-Zohairy A. Creating tight proximal contacts for MOD resin composite restorations. Oper Dent 2011; 36: 304–310.

„Sectional pre-contoured metal matrix system provided the highest contact tightness with the highest length of contact arc. Restorations with circumferential pre-contoured metal matrix system provided higher LCA than those with circumferential straight metal matrix with Tofflemire retainer and circumferential pre-contoured transparent matrix system“

Kampouropoulos D, Paximada C, Loukidis M, Kakaboura A. The influence of matrix type on the proximal contact in class II resin composite restorations. Oper Dent 2010; 35: 454-462

Izolace pracovního pole

Pre-wedging

= separace zubů klínkem již během preparace

- Ochrana sousedního zuba během preparace
- Umožnění pozdějšího zavedení sekční matrice bez její deformace
- Dostatečná separace zubů, která kompenzuje tloušťku matrice
- Informace o hloubce preparace
- Nedostatečná separace zubů může způsobit deformaci sekční matrice a následnou konkavitu výplně

A close-up photograph showing a dental composite restorative material being applied into a prepared tooth cavity. The composite is a light beige color and is being carefully packed into the margins of the preparation. A dental instrument, likely a matrix or a composite spatula, is visible on the left side of the image.

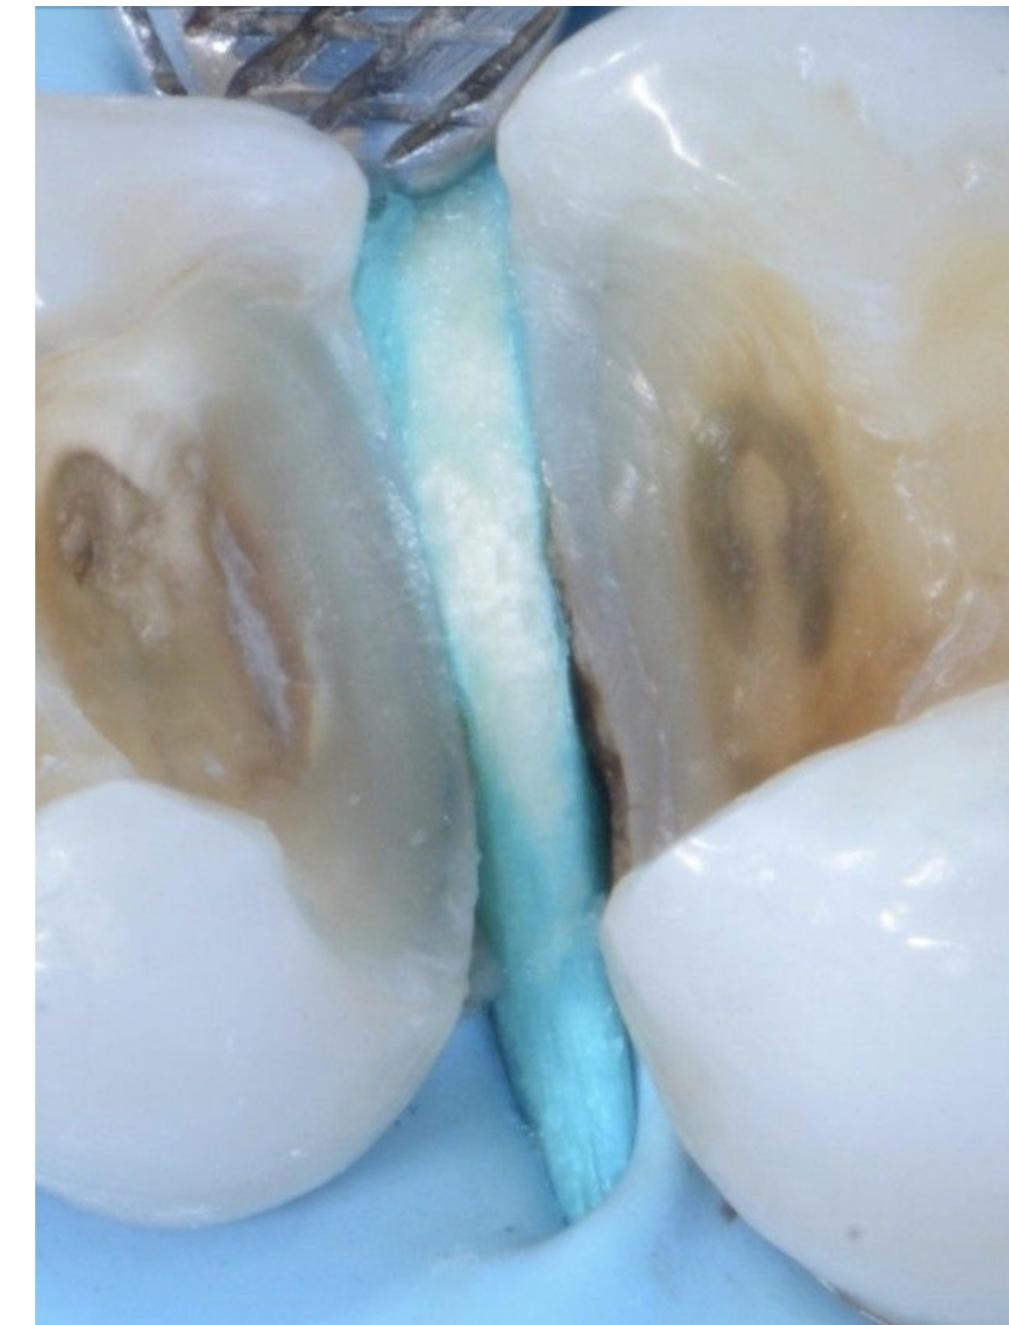

Adaptace klínu a matrice

- Matrice umístěna alespoň 0,5 mm apikálně od gingiválního schůdku
- Klínek umístěný nad gingiválním schůdkem by způsobil konvexitu matrice směrem do kavity
- Klínek může být umístěn vestibulárně i orálně

Utěsnění matrice

Konečná úprava výplně

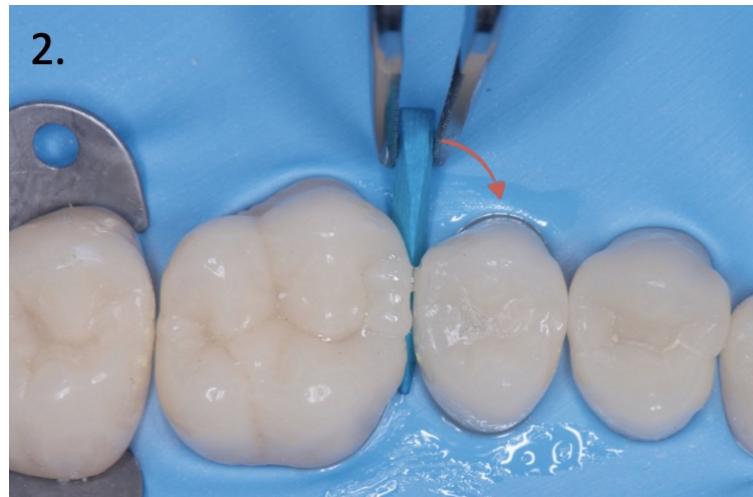

- Úprava sýpanou páskou
- Sof-Lex disky
- Kontrola bodu kontaktu a nerovností pomocí dentální nitě

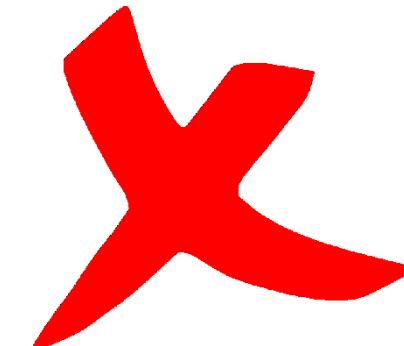

A close-up photograph of four dental teeth models arranged horizontally. The models are light-colored with some brownish stains. They are held in place by blue dental retractor hooks and a metal dental retractor. The background is a solid blue.
