

Larynx

**ENT Clinic of Masaryk
university, Brno
Faculty St. Ann Hospital**

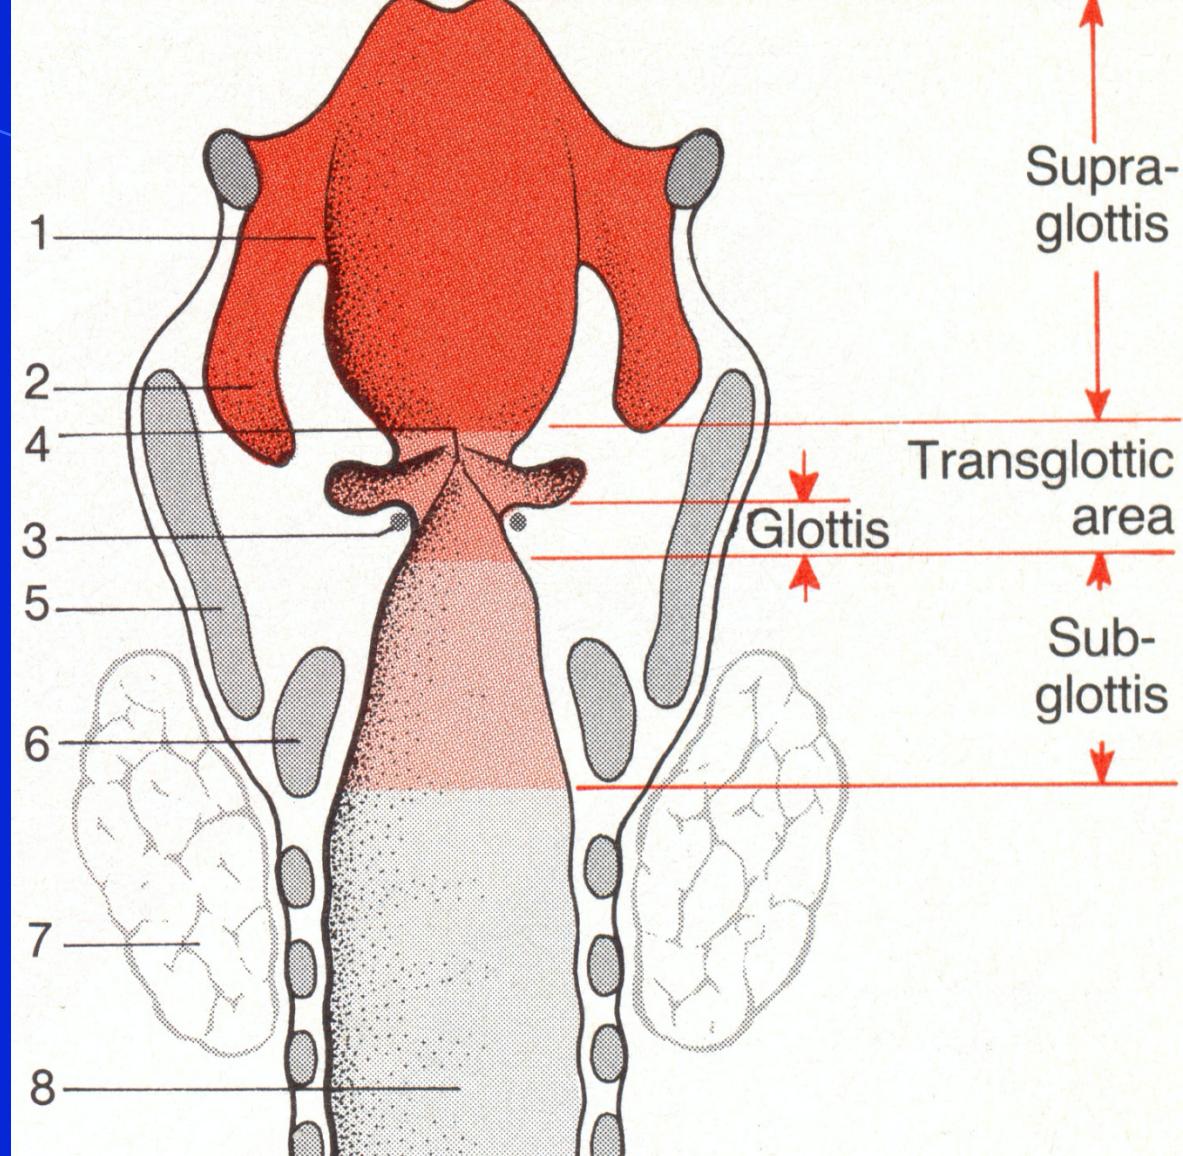

LARYNX - function

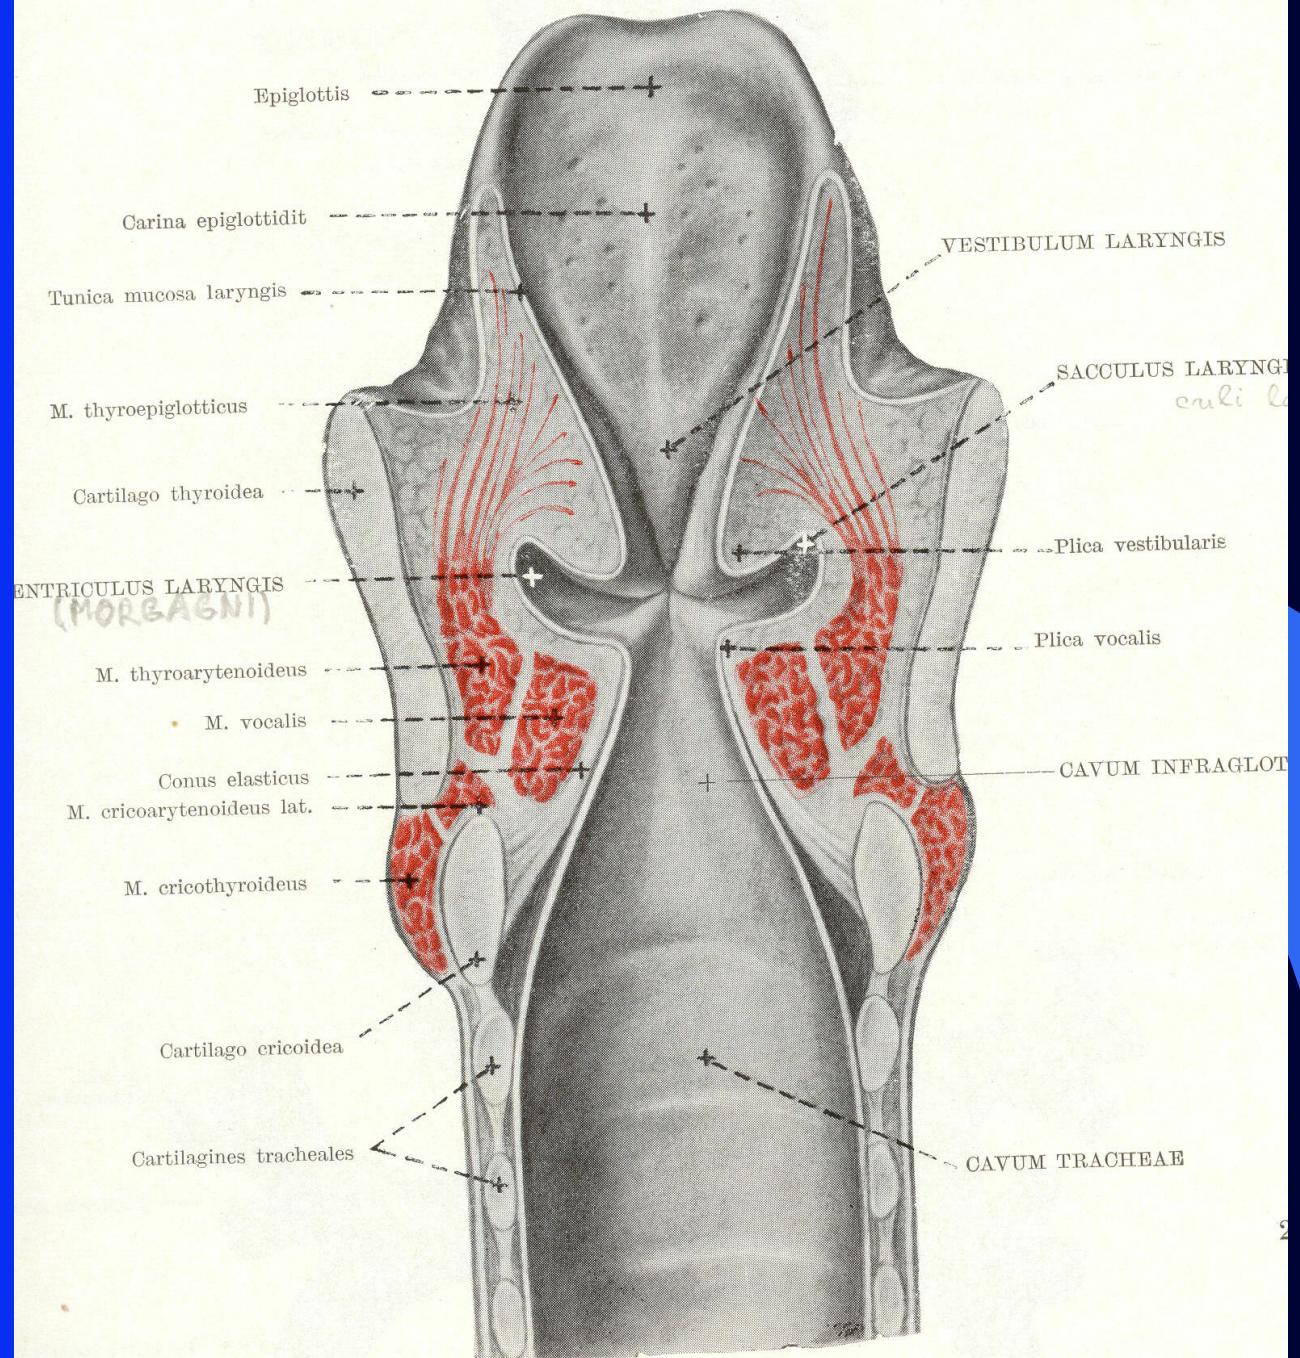

Function: **vital** (respiration), **social** (phonation),
protective of lower airways (reflexes: closure of
aditus, glottis, cough reflex etc.)

Frontal laryngeal section

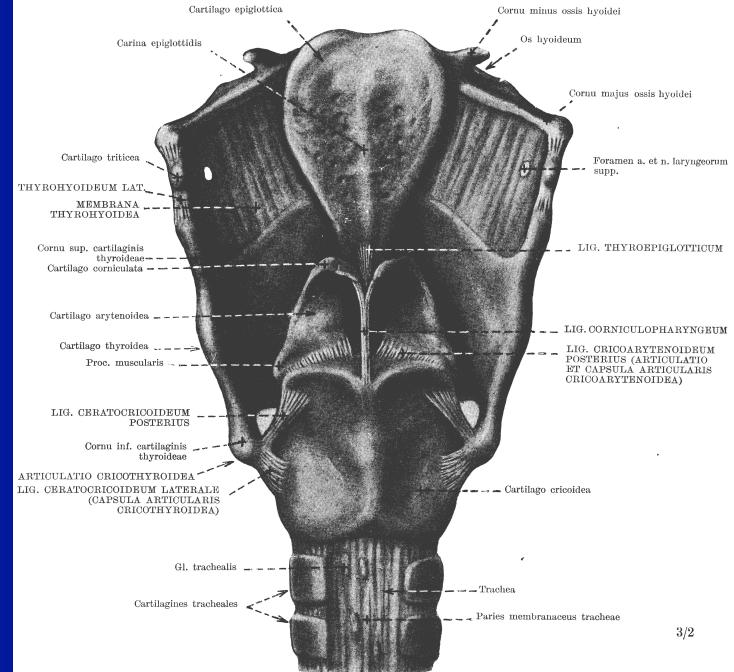

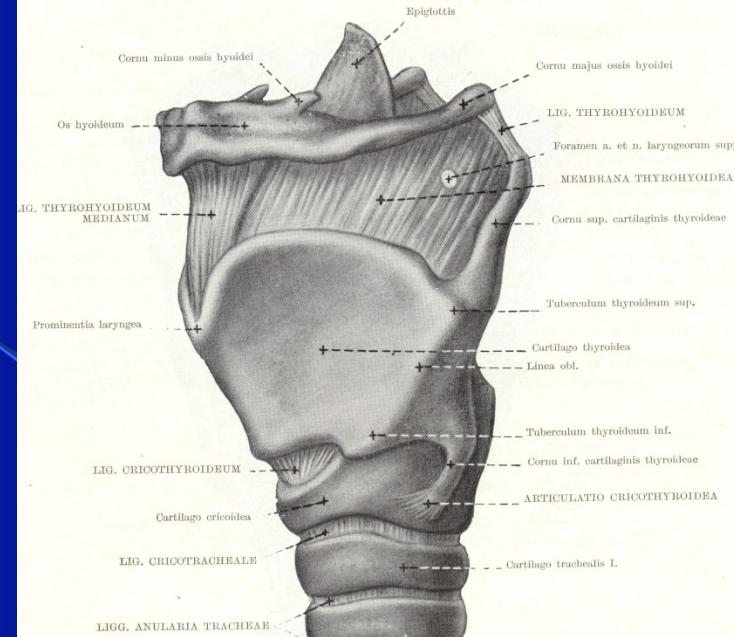

1. Aryepiglottic fold, 2. recessus piriformis, 3. vocal cord, 4. anterior commissure, 5. thyroid cartilage, 6. cricoid cartilage, 7. thyroid gland, 8. trachea. (Taken from Becker, Neumann, Pfaltz. Ear, Nose and Throat Diseases 1989)

Larynx

**3 non-pair cartilages
(thyroid, cricoid and epiglottis)**

**3 pair cartilages –
arytenoidea, corniculatae
(Santorini), cuneiformes
(Wrisbergi)**

Laryngeal muscles

Muscle moving larynx:

infrahyoid (sternohyoideus, -thyreoideus,
thyreohyoideus, omohyoideus),
suprahyoid

One's own laryngeal muscles:

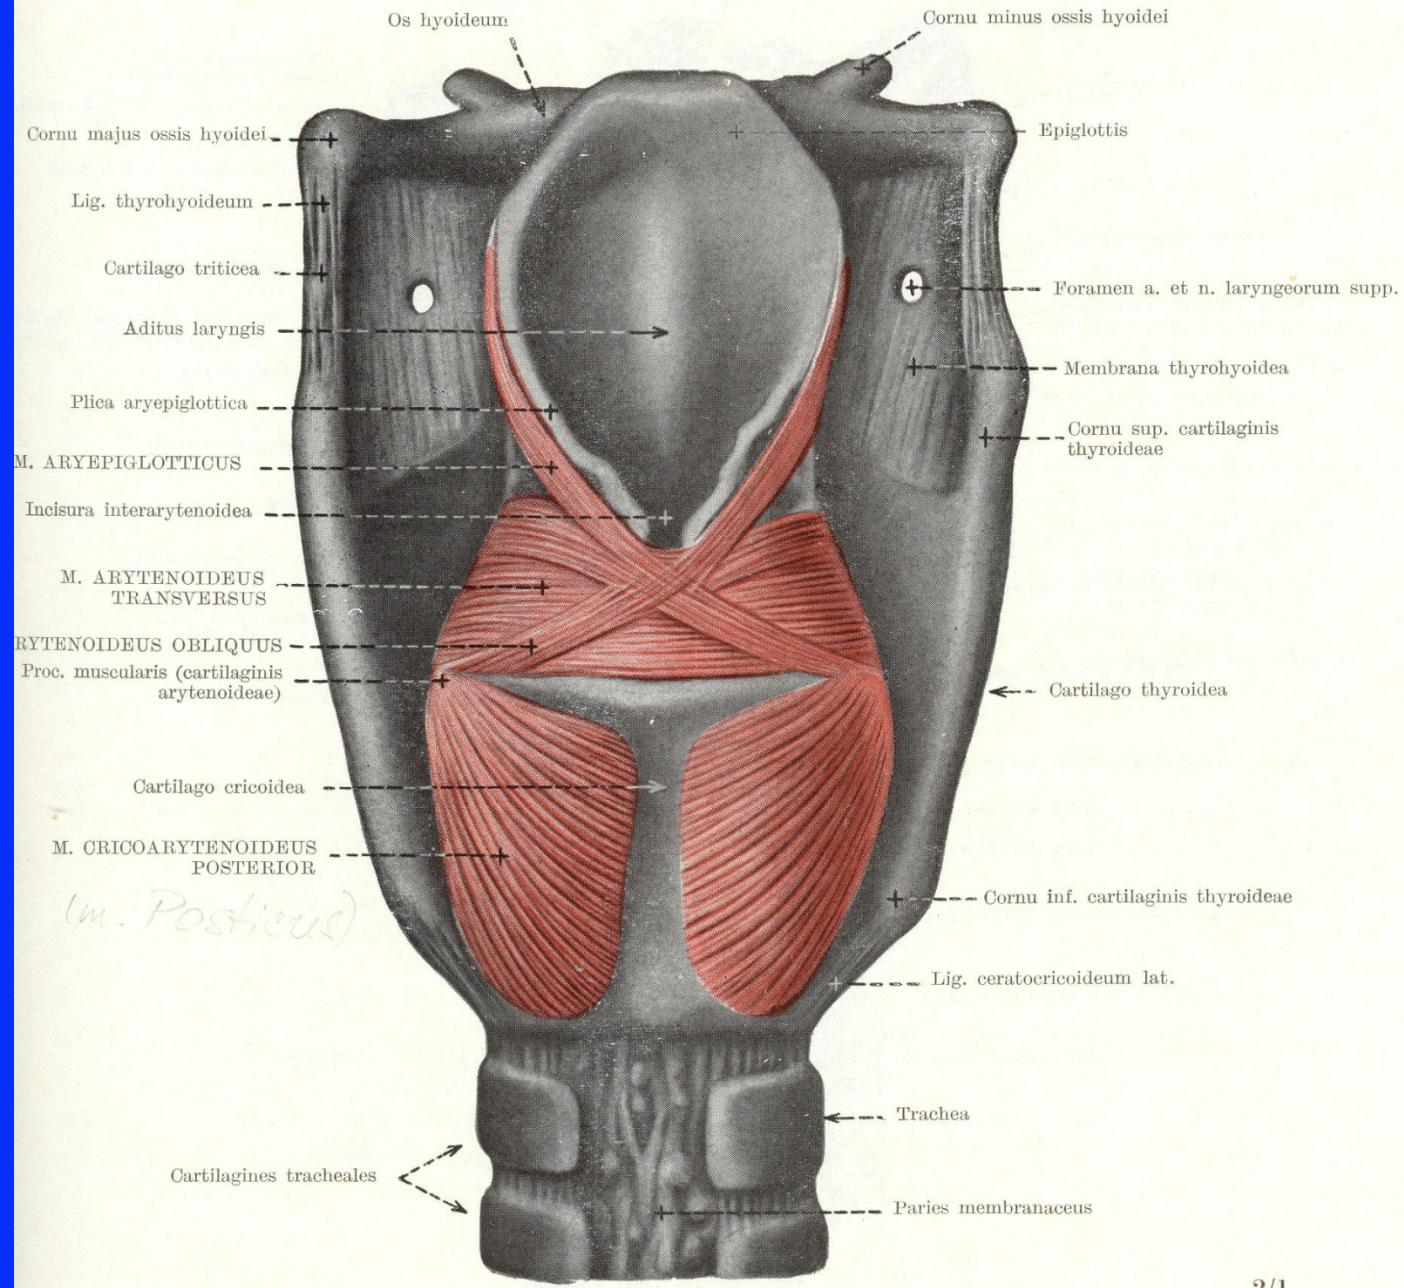

Abductores (open) – m. cricoarytenoideus post.
(POSTICUS)

Adductores (close) – cricoaryteoideus lat.,
arytenoideus transversus

Tensores (stretch) – m.cricothyreoides (r.
ext. N. laryngici sup.), m. vocalis

Muscles moving aditus laryngis

m. aryepiglotticus, thyreoepiglotticus

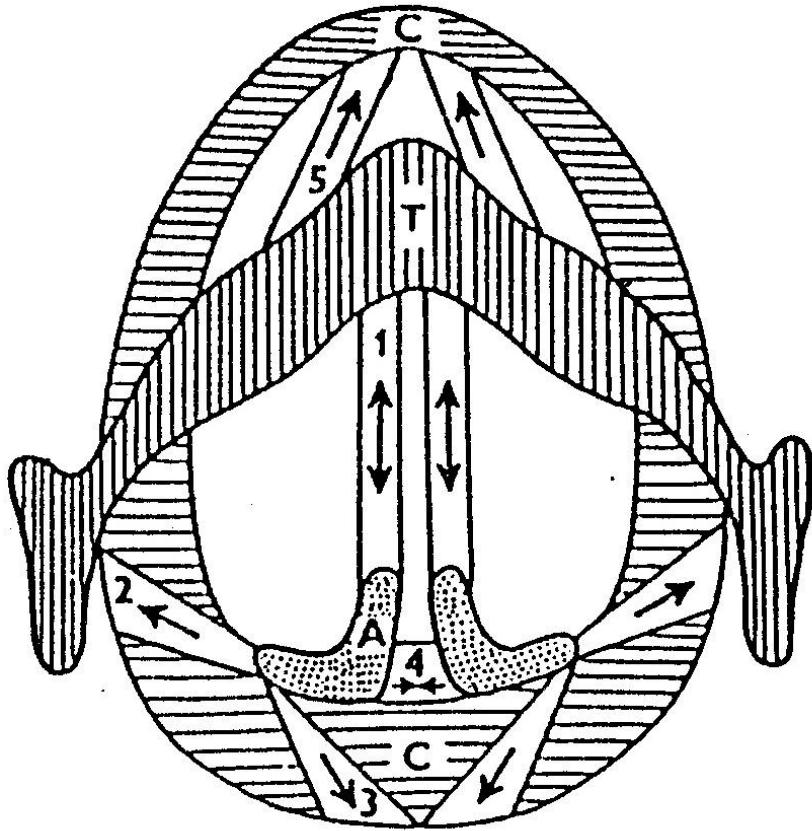

Schema of function of laryngeal muscles

A-cartilago arytenoidea

C-cartilago cricoidea

T-cartilago thyroidea

1.-**m. thyreoarytenoideus /vocalis/ "internus"**

2.-**m. cricoarytenoideus lateralis**

3.-**m. crycoarytenoideus posterior "posticus"**

4.-**m. arytenoideus transversus "transversus"**

5.-**m. cricothyreoideus**

Laryngeal muscles

Muscle moving larynx:

infrahyoid (sternohyoideus, -thyreoideus,
thyreohyoideus, omohyoideus),
suprahyoid

One's own laryngeal muscles:

Abductores (open) – m. cricoarytenoideus post.
(POSTICUS)

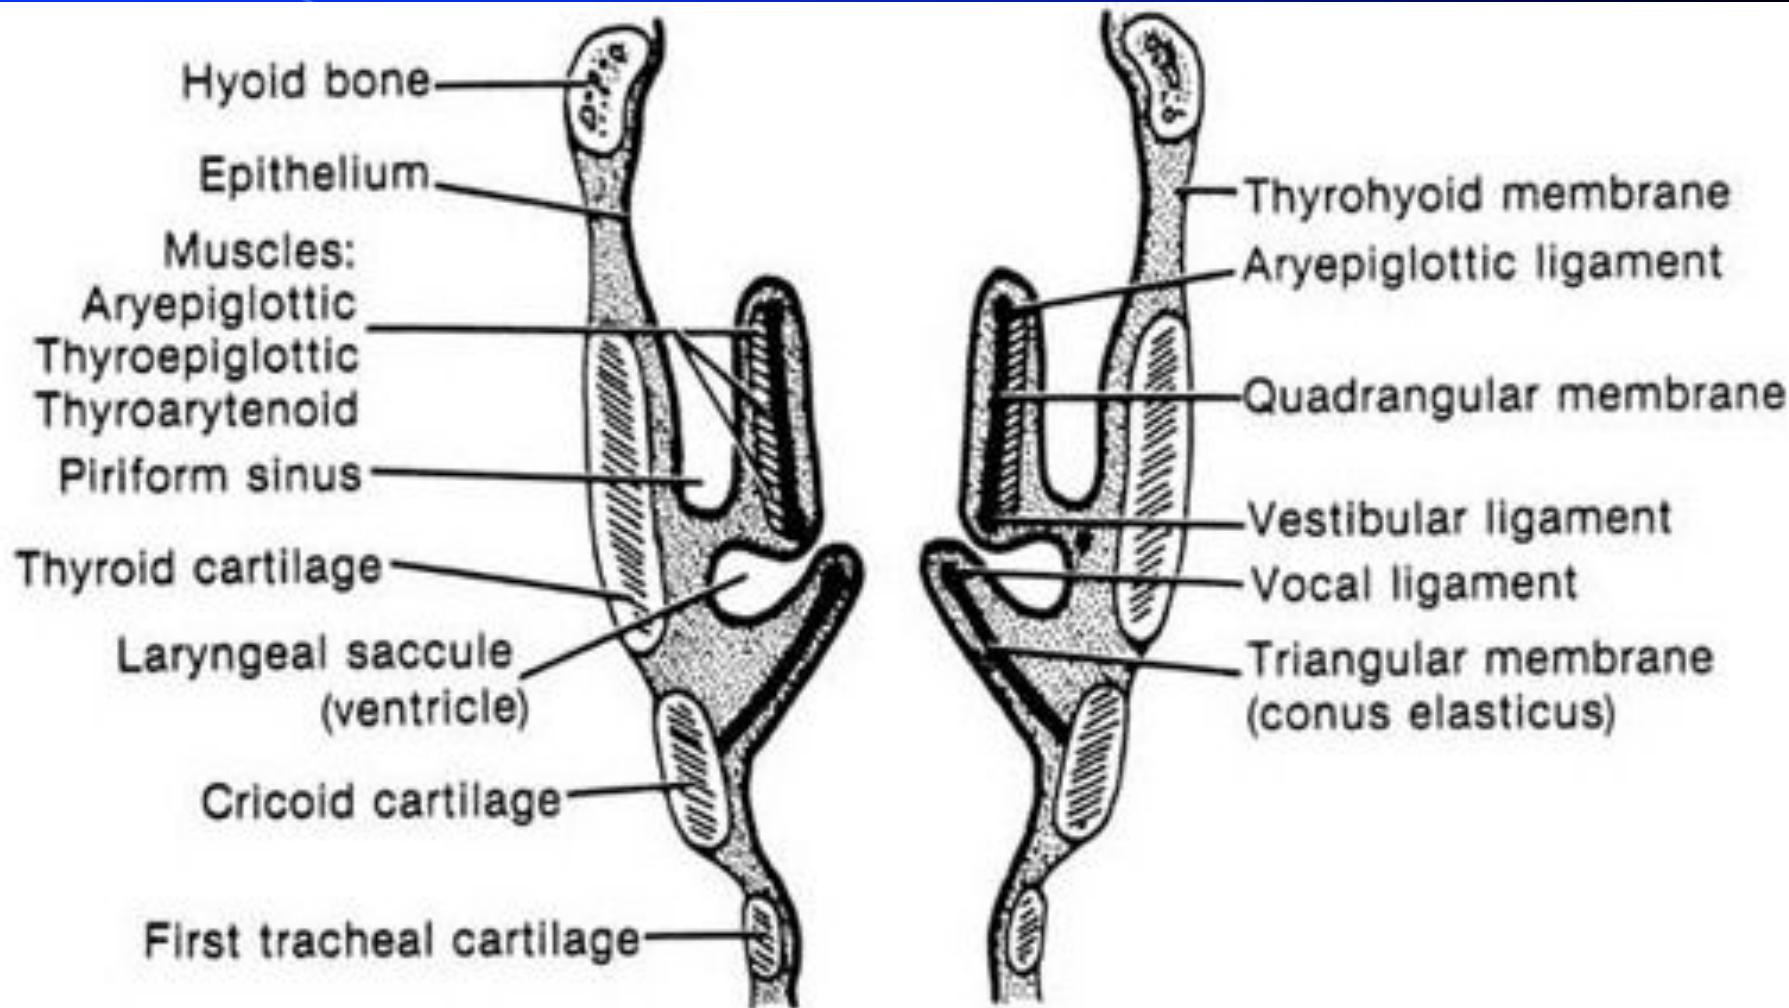

Adductores (close) – cricoaryteoideus lat.,
arytenoideus transversus

Tensores (stretch) – m.cricothyreoides (r.
ext. N. laryngici sup.), m. vocalis

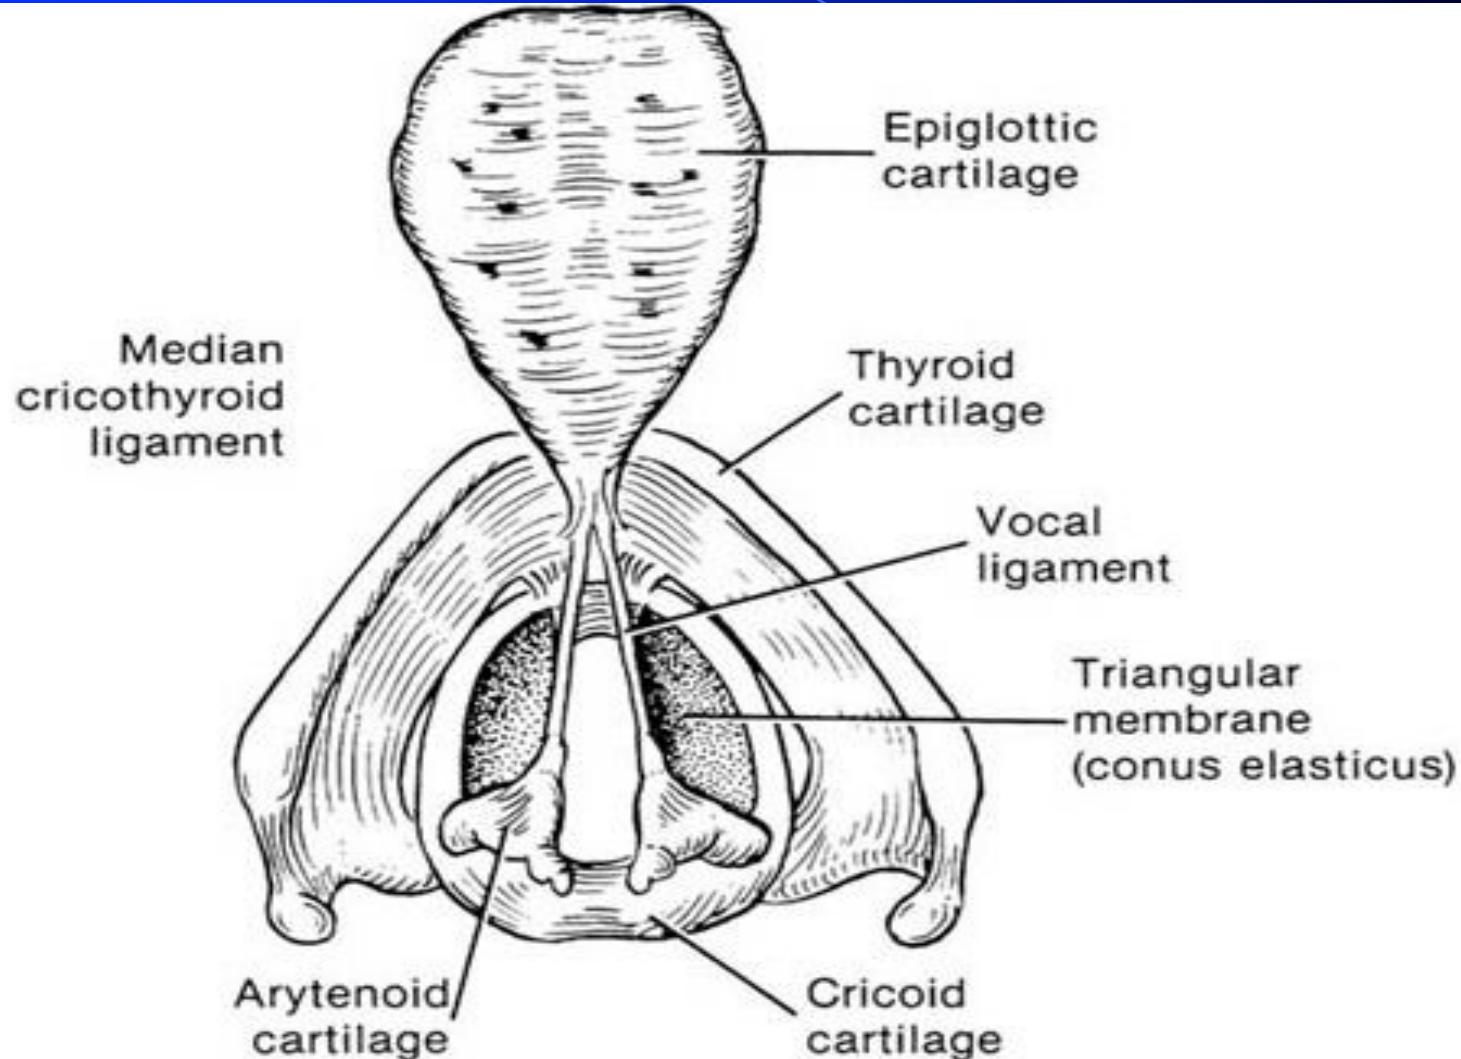

Muscles moving aditus laryngis

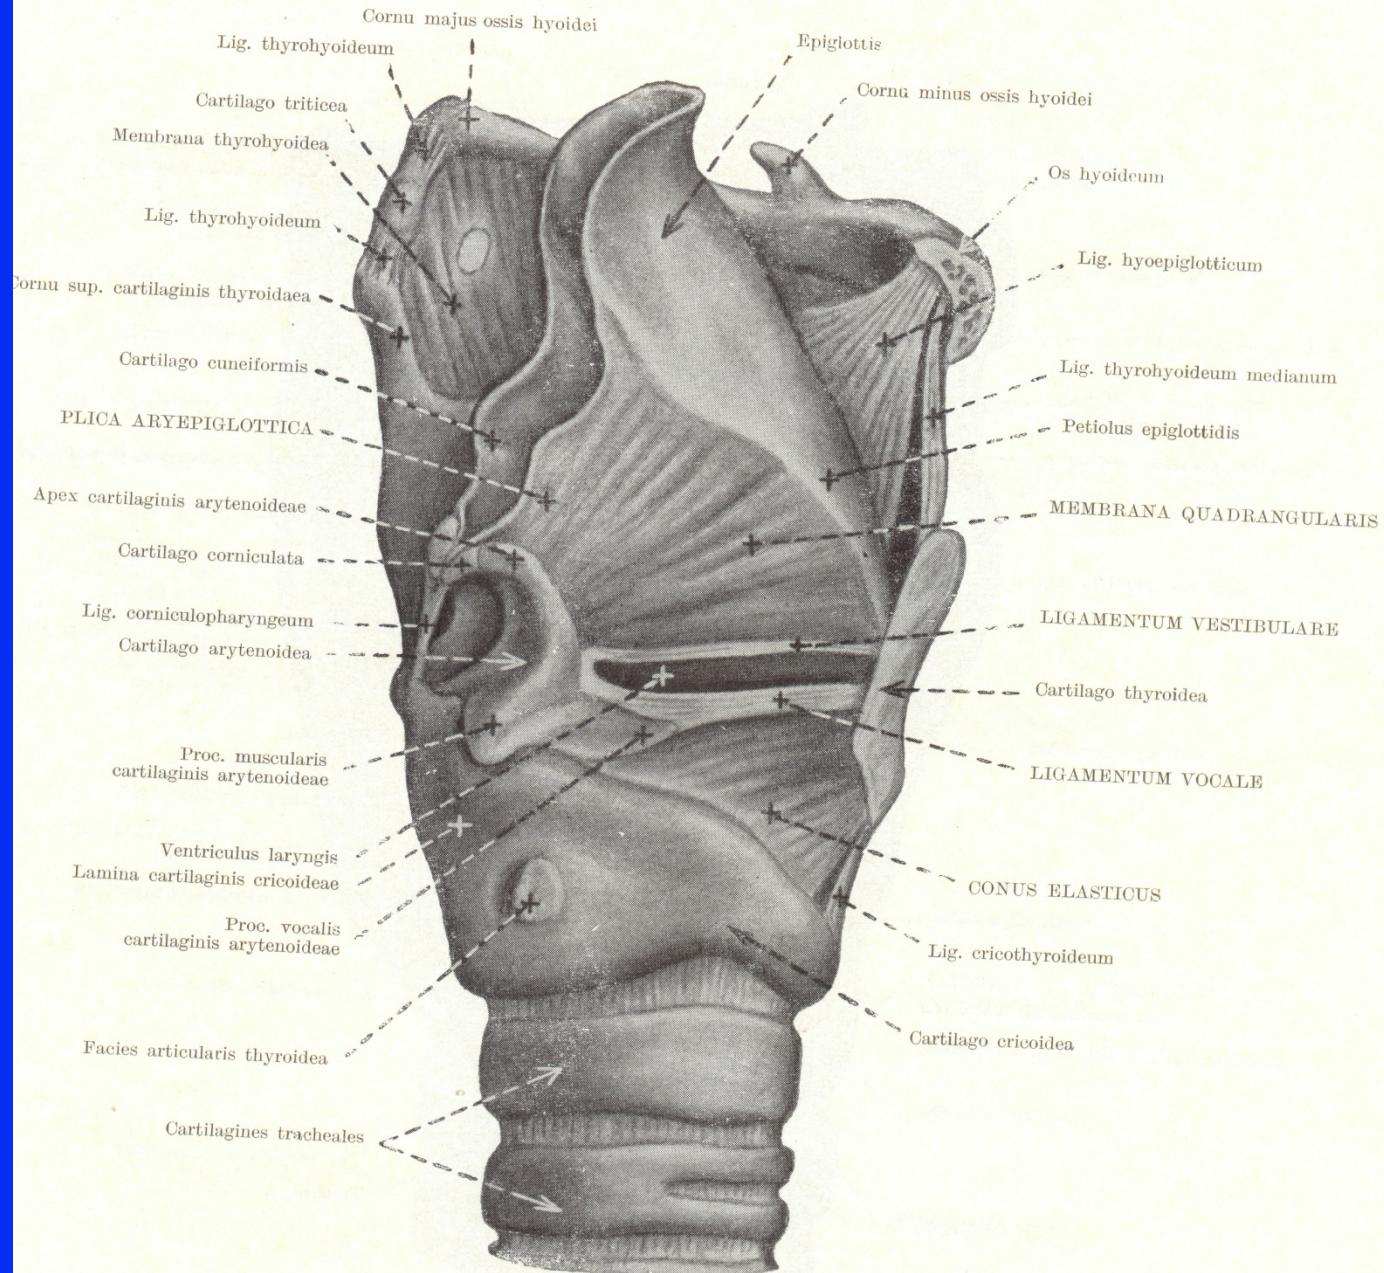

m. aryepiglotticus, thyreoepiglotticus

Internal ligaments and connective tissue membranes (membrana fibroelastica laryngis=quadrangularis + conus elasticus)

Conus elasticus

History of disorder

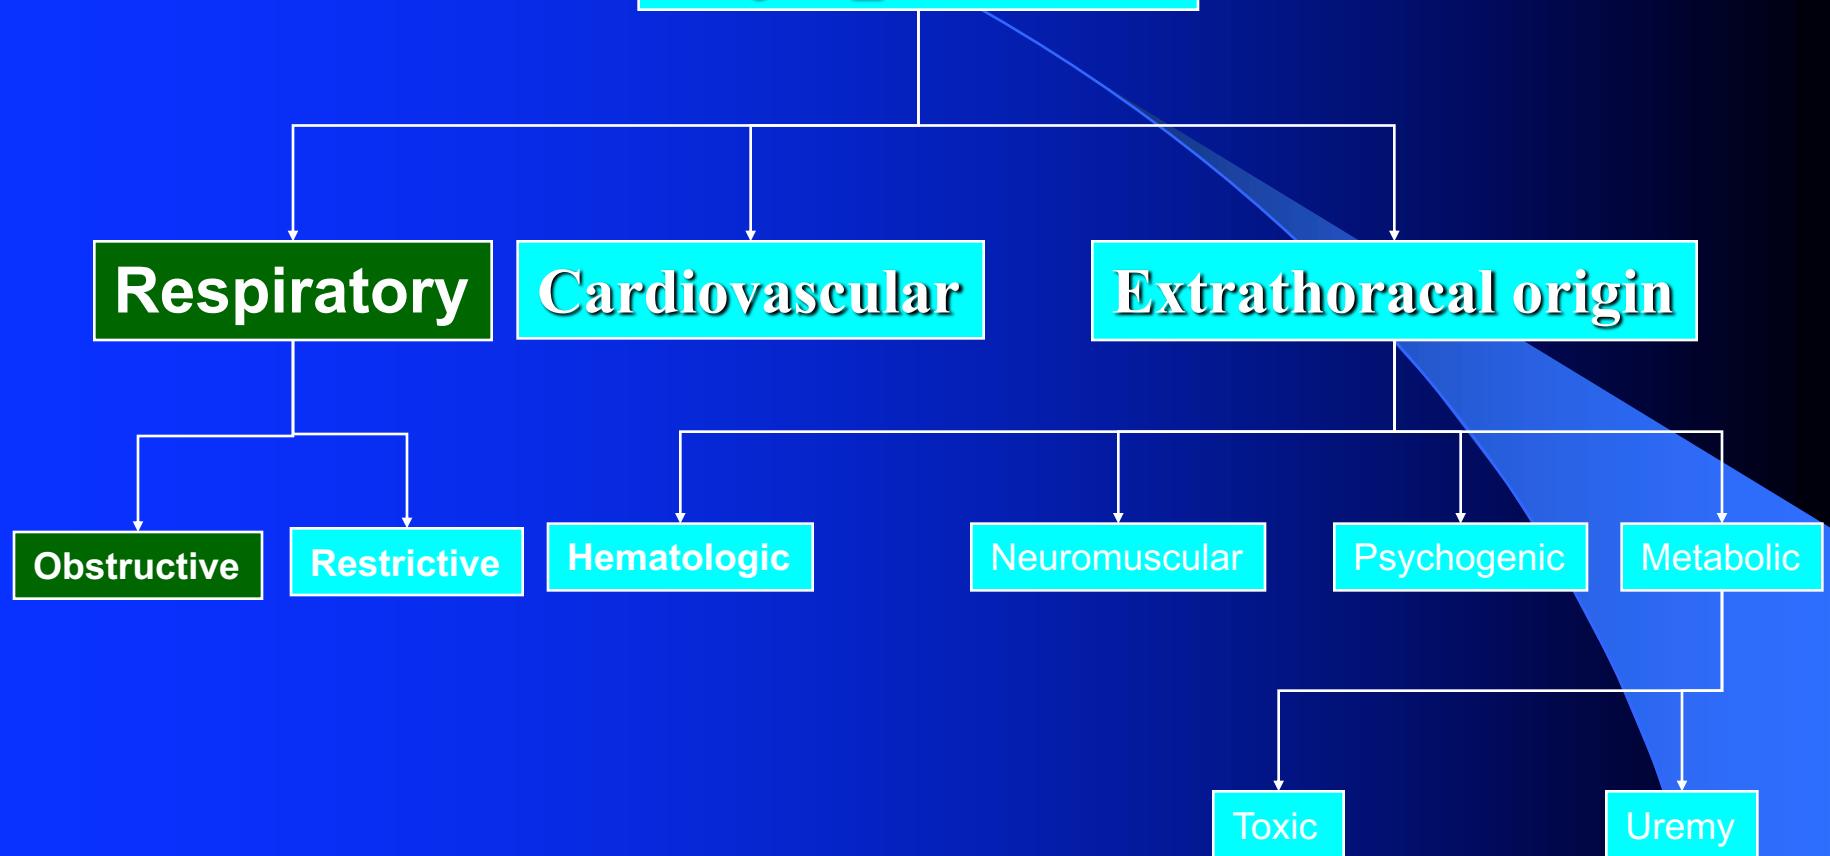

Breathing disorder

inspiratory stridor - stenosis localised upwards from bifurcation. Symptoms of usage of auxiliary breathing muscles (retraction of jugulum). There is longer inspirium as expirium. General symptoms - agitation with anxiety, loss of orientation, loss of conscience, tachycardia, usually bradypnoea. Auscultation the most noisy stridor above stenosis. Skin colour pale, then cyanotic. Growing exhaustion, alarm face.

Voice disorder

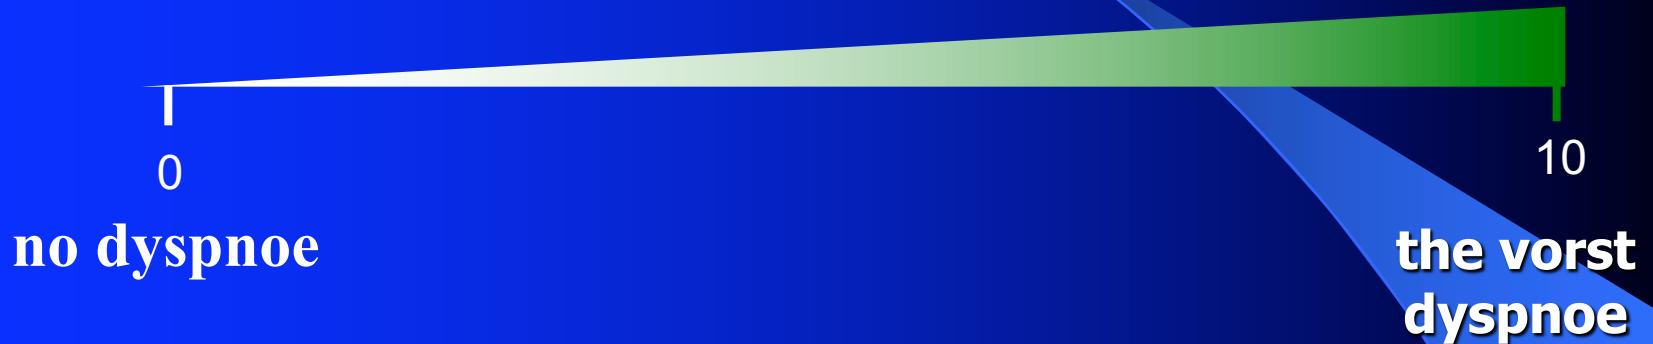

Chrapot – trvající déle jak 14 dní u mužů rizikové skupiny (kuřák nad 40 let věku) by měl být vyšetřen otolaryngologem.

Dyspnoe

Evaluation of dyspnoe

- Subjective scales

- (quasi) objective scales

- no dyspnoe (0)
- dyspnoe after greater physical labour than usually (1)
- dyspnoe after usual physical labour (2)
- dyspnoe at any physical action (3)
- dyspnoe in no action (4)

Pathophysiology of obstructive respiratory insufficiency

- inspiratory dyspnoe
- stridor - 400-800 Hz, the most proximal stenosis, the lower frequency is
- Involvement of auxiliary breathing muscles
- dysphony
- cough, sometimes odynphagia.

Stage of compensation – prolongation of regular inspiration, good blood supply, possible causal therapy

Stage of decompensation – mild tachypnoe, motoric agitation, hyperkapnia, anoxemia, respiratory acidosis, larynx in anteflex position, anxiety, exhaustion. Hyperkapnia leads gradually to inhibition of breathing center

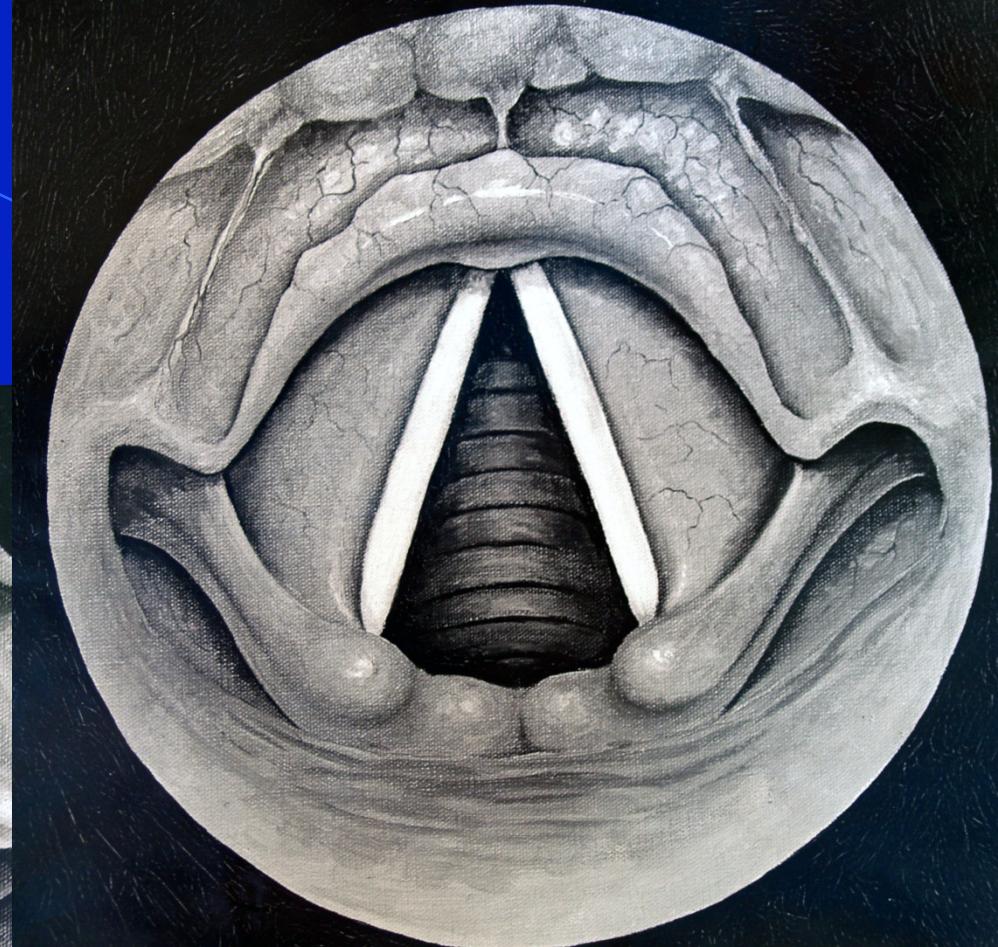

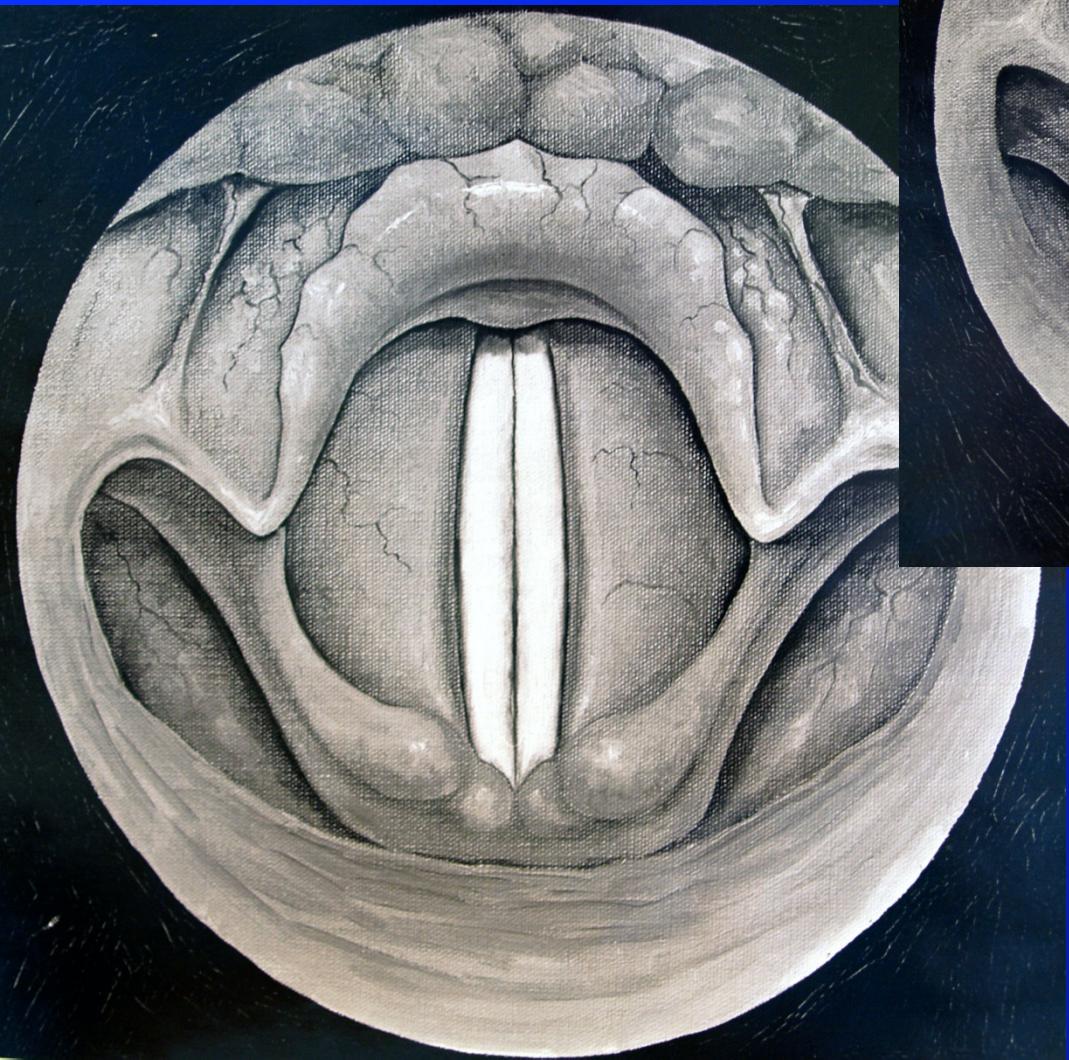

Stage of suffocation – air flow with turbulency, decreased breath volume, reanimation is necessary

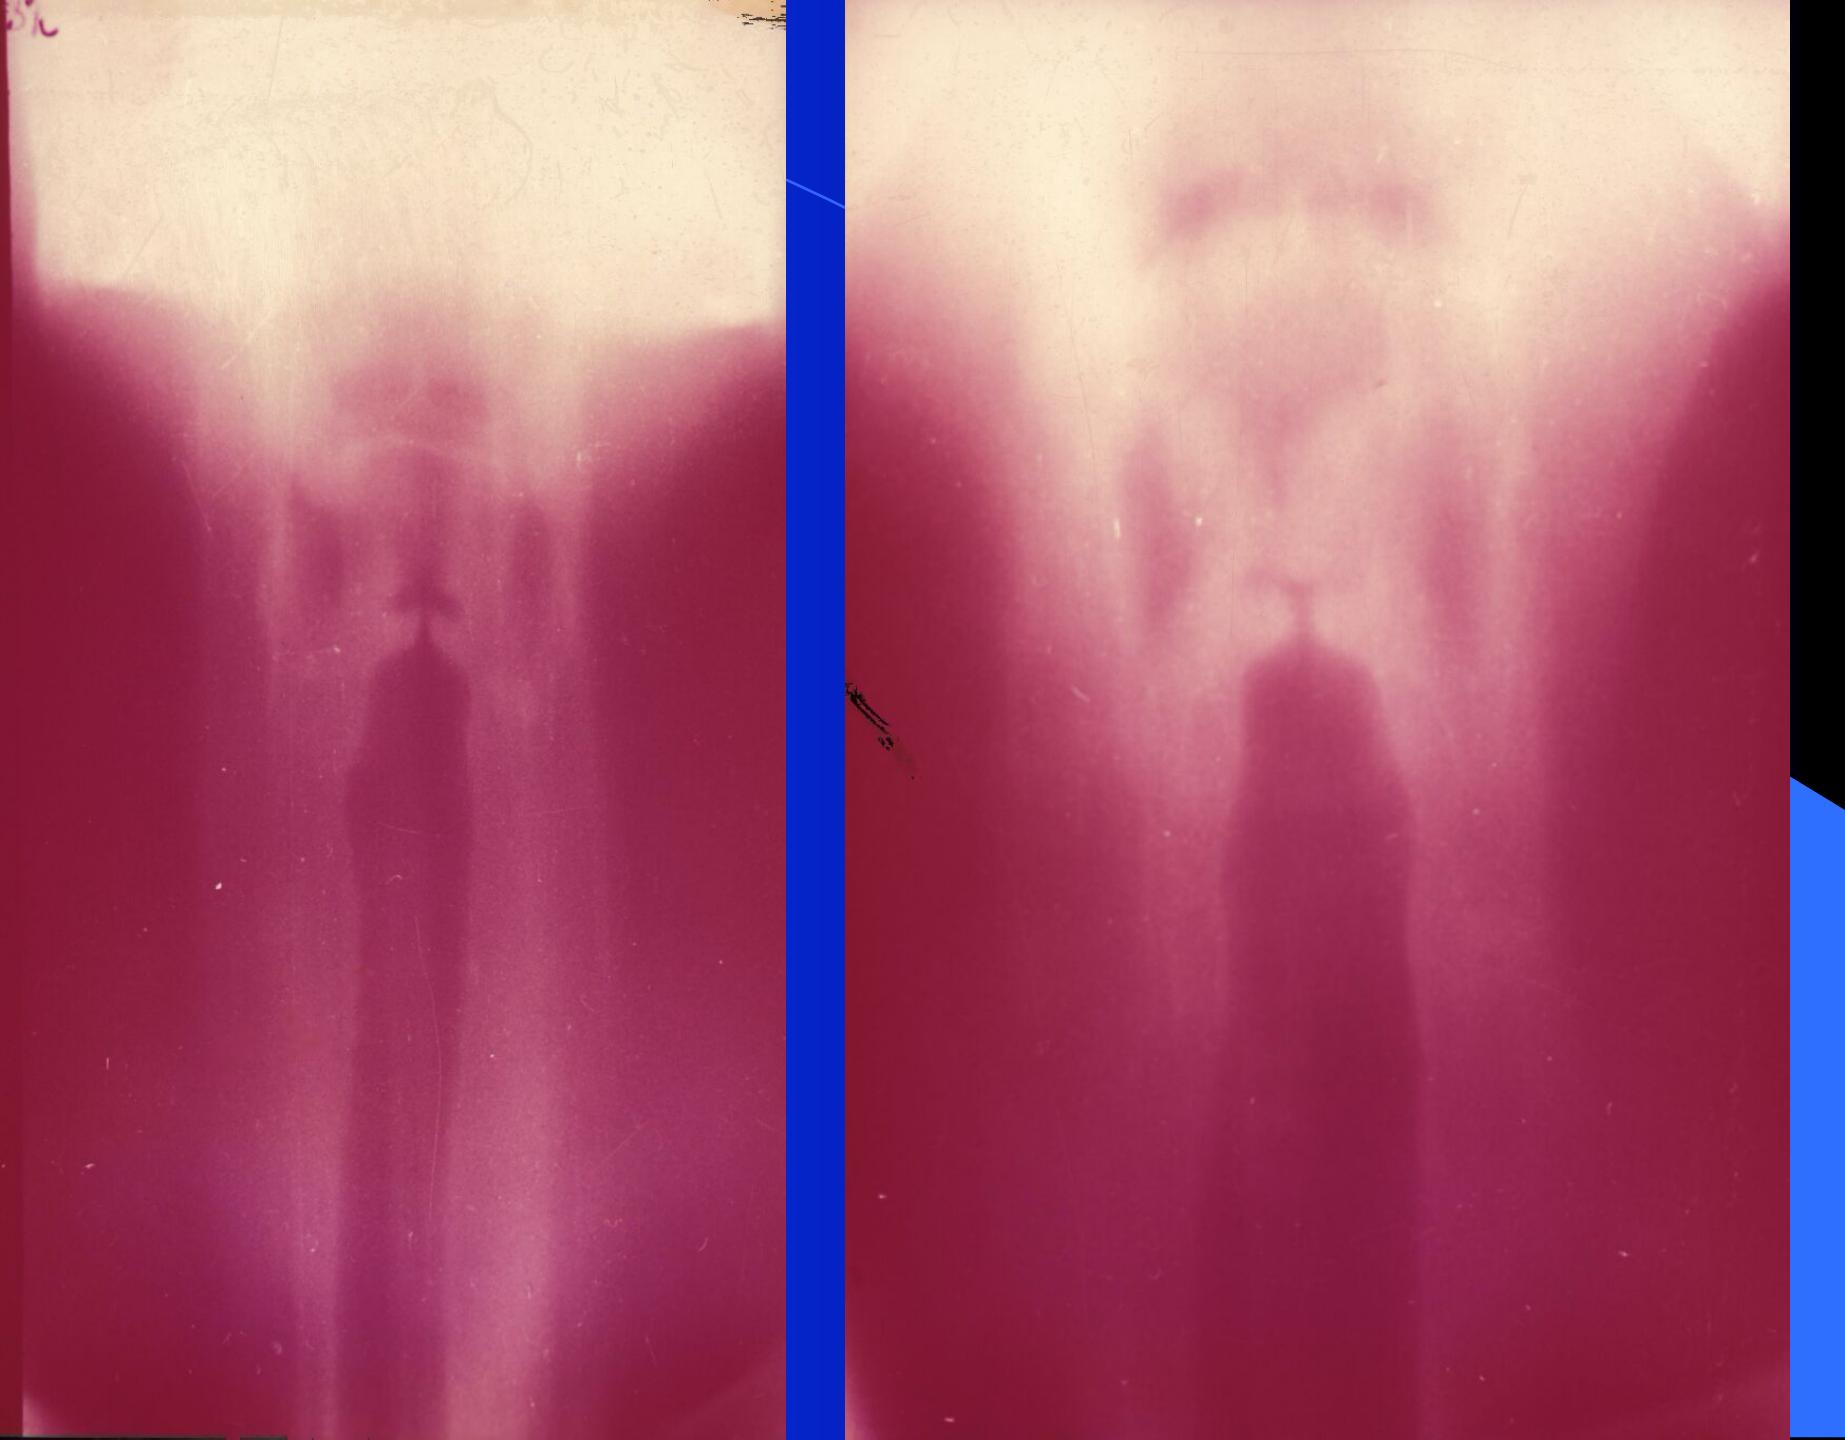

Obstructive respiratory insufficiency

1. Larynx and superior part of trachea - „laryngeal“ dyspnoe
inspiratory stridor (stage of decompensation) - stenosis localised upwards from bifurcation. Symptoms of usage of auxiliary breathing muscles (retraction of jugulum). There is longer inspirium as exspirium. General symptoms - agitation with anxiety, loss of orientation, loss of conscience, tachycardia, usually bradypnoe. Auscultation the most noisy stridor above stenosis. Skin colour pale, then cyanotic. Growing exhaustion, alarm face.
2. Distal part of airways. *Expiratory stridor* - longer expiration. Asthma bronchiale

Methods of investigation

- **Inspection**
- **Palpation (crepitation, emphysema)**
- **Indirect laryngoscopy**
- **Direct laryngoscopy**
- **Microlaryngoscopy sec Kleinsasser**
- **Stroboscopy (high frequency movies, allowing scientific analysis of the laryngeal function, especially of the vocal cords)**
- **Tomography**
- **CT**

Congenital laryngeal anomalies

Laryngomalacia – dyspnea, dysphonia, dysphagia. Unusual weakness of the supraglottic laryngeal skeleton

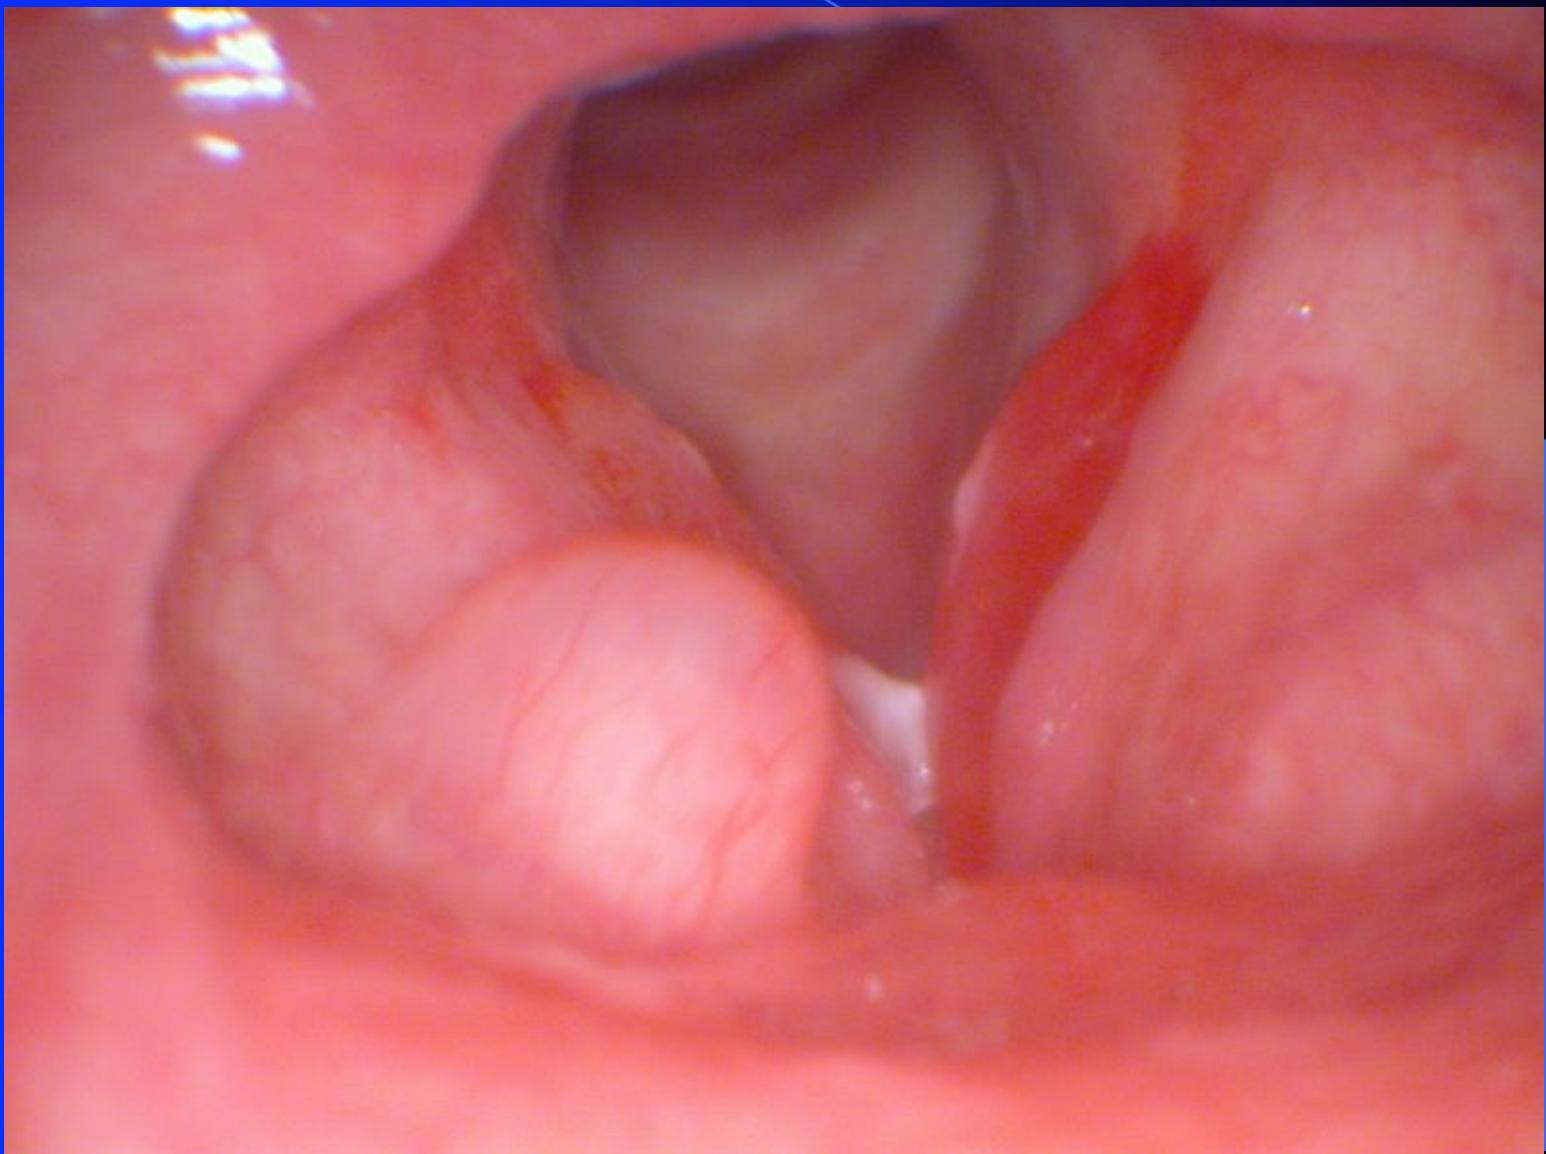

Laryngoceles – lie within the larynx in the vestibular fold – dyspnoe, dysphonia

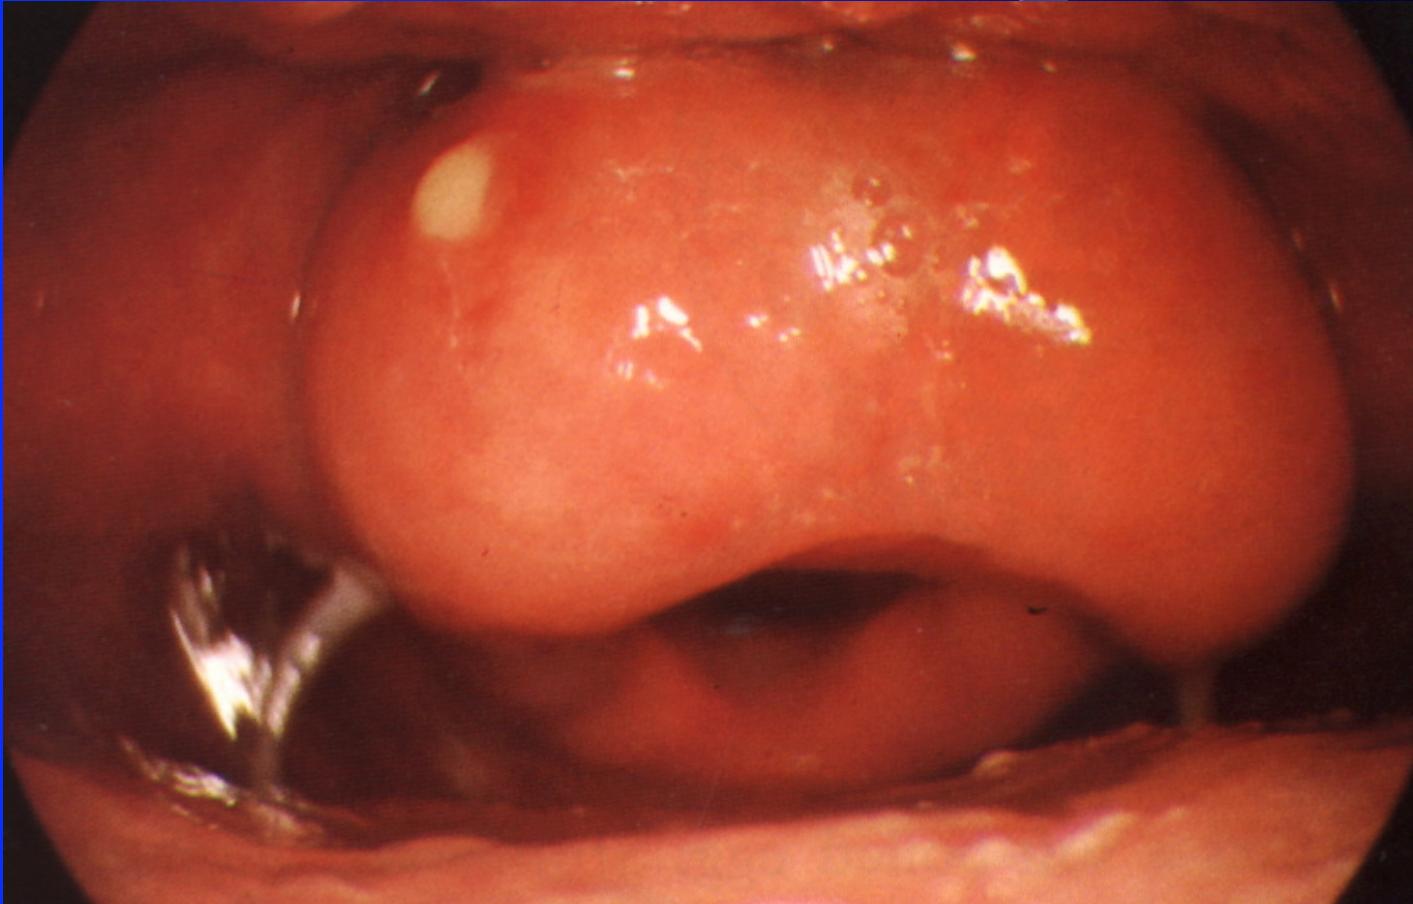

Atresia and membranes

Laryngitis acuta (restricted x diffused)

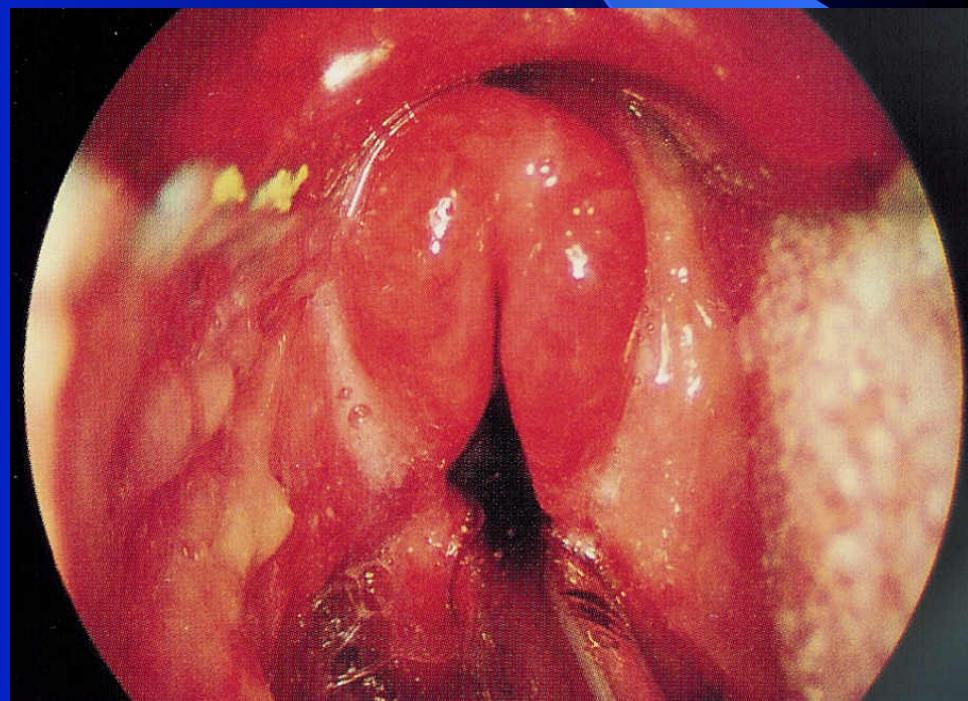

Abscesus epiglottidis

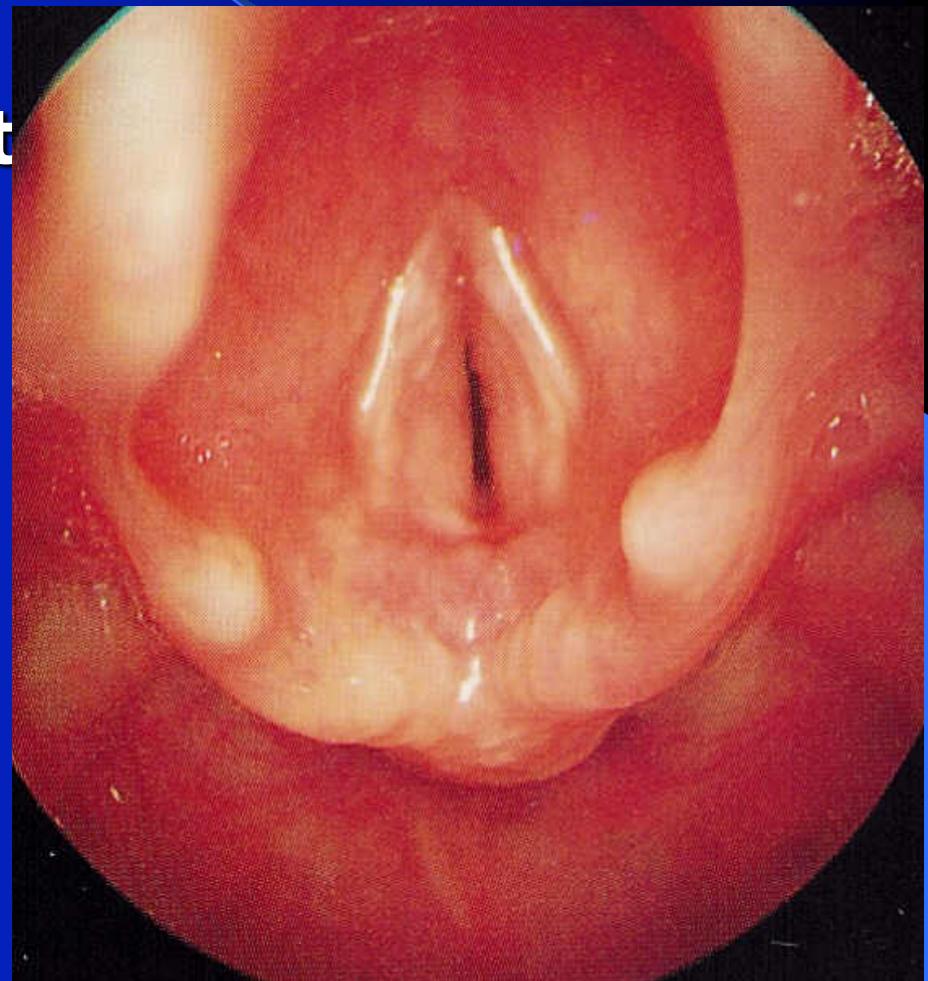

Acute supraglottic laryngitis - epiglottitis

- **Hemophilus influenzae**
- **inspiratory stridor**
- **dysphagia**
- **Antibiotic treatment**
- **steroids**
- **tracheal intubation**
- **tracheostomy**

Acute subglottic laryngitis

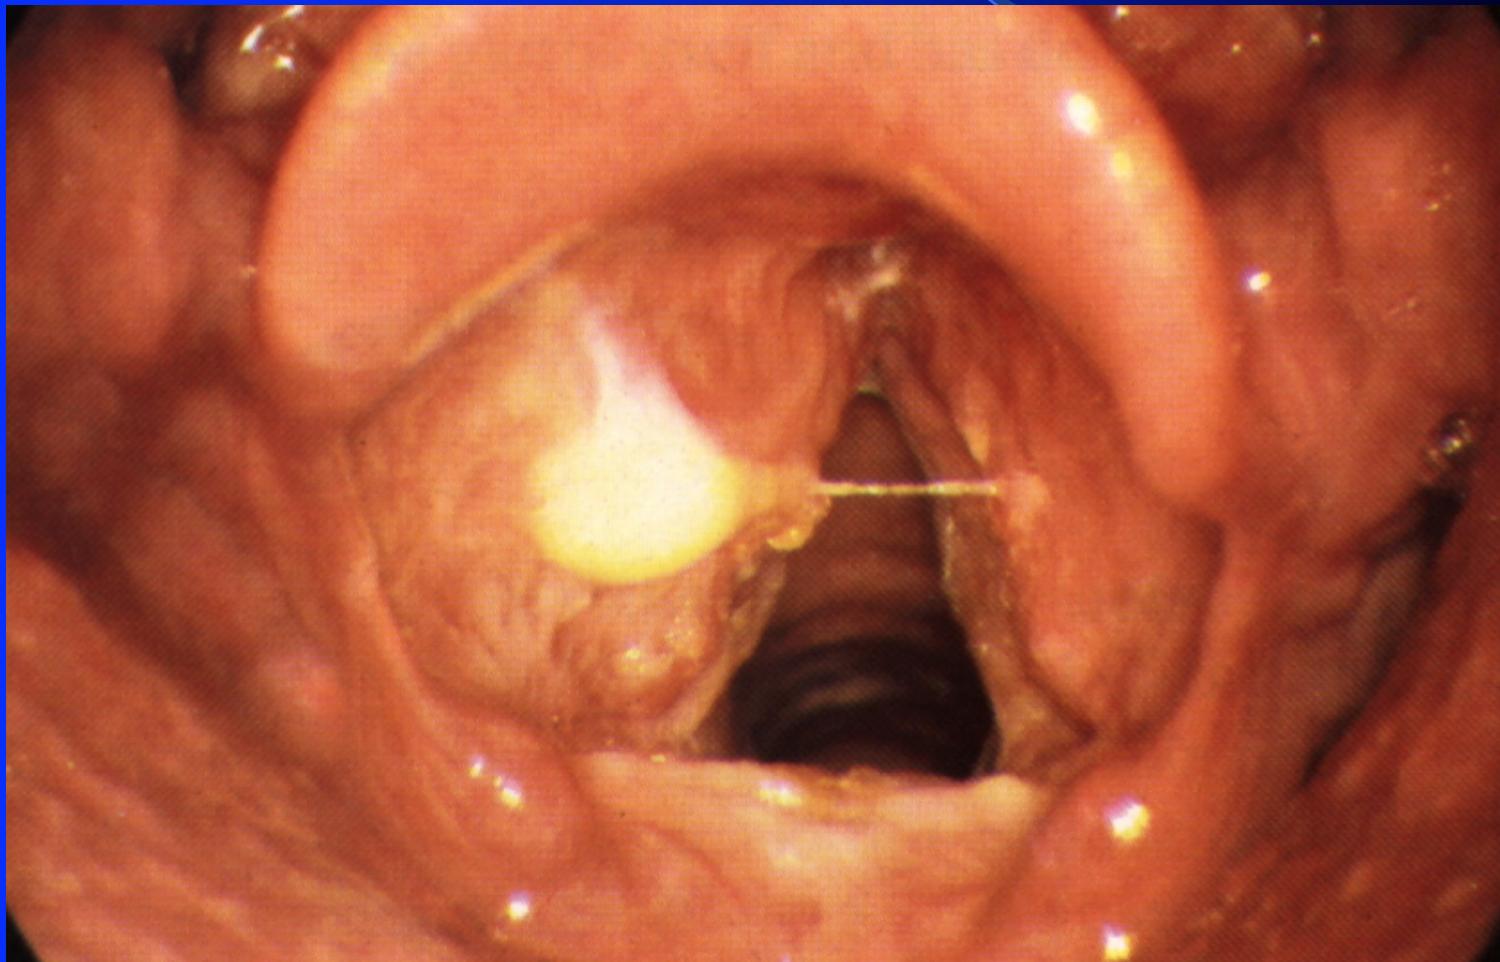

- **Viral infection**
- **Rapid growth at night**
- **cough**
- **inspiratory stridor,
inspiratory dyspnea**
- **steroids, sedation,
ATB,**
- **Mikroclima (steam
inhalation)**

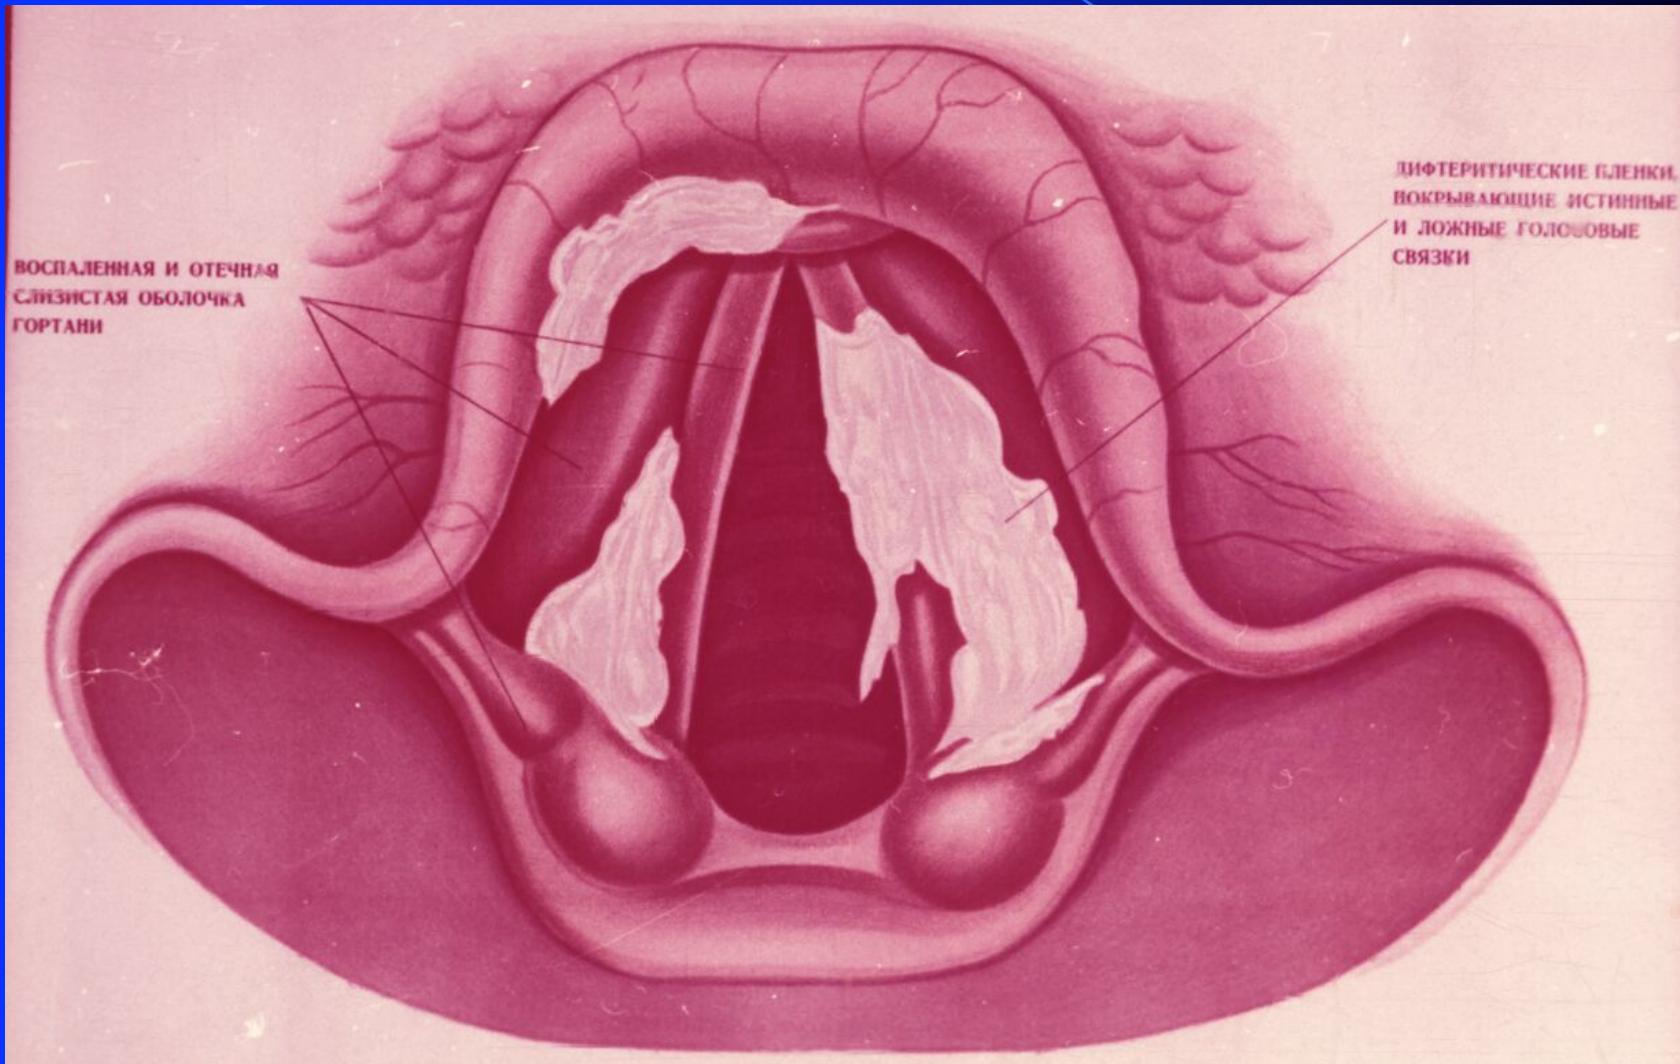

Angioneurotic swelling of larynx

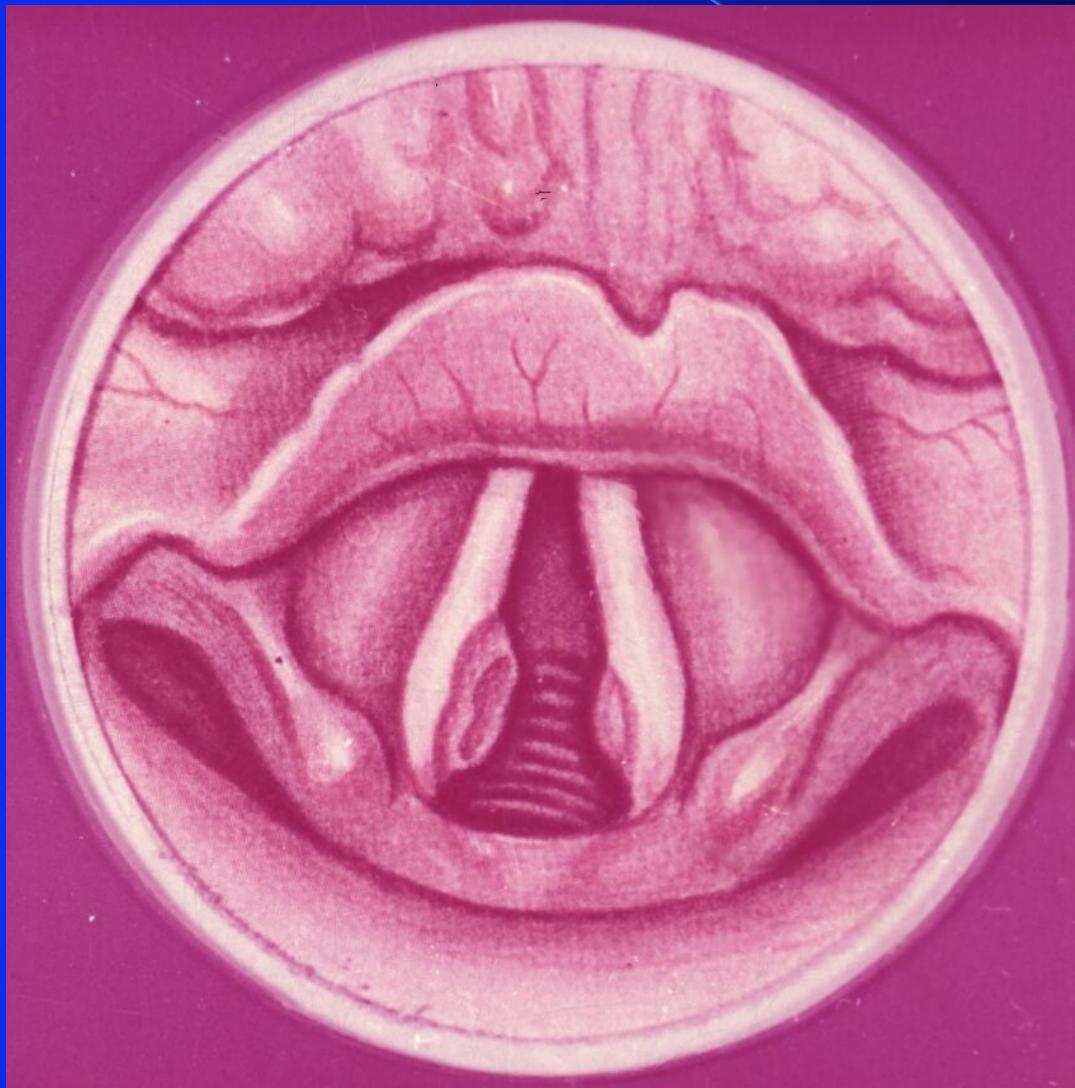

Laryngitis chronica

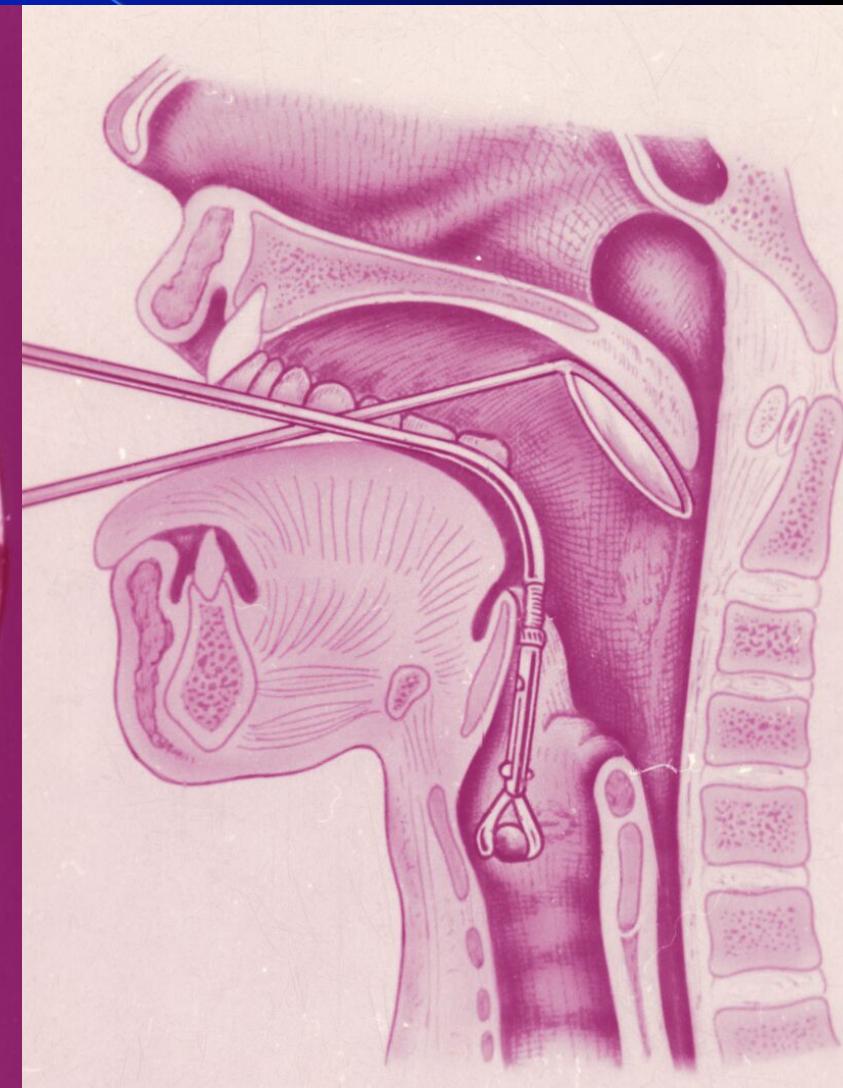

Diphthery

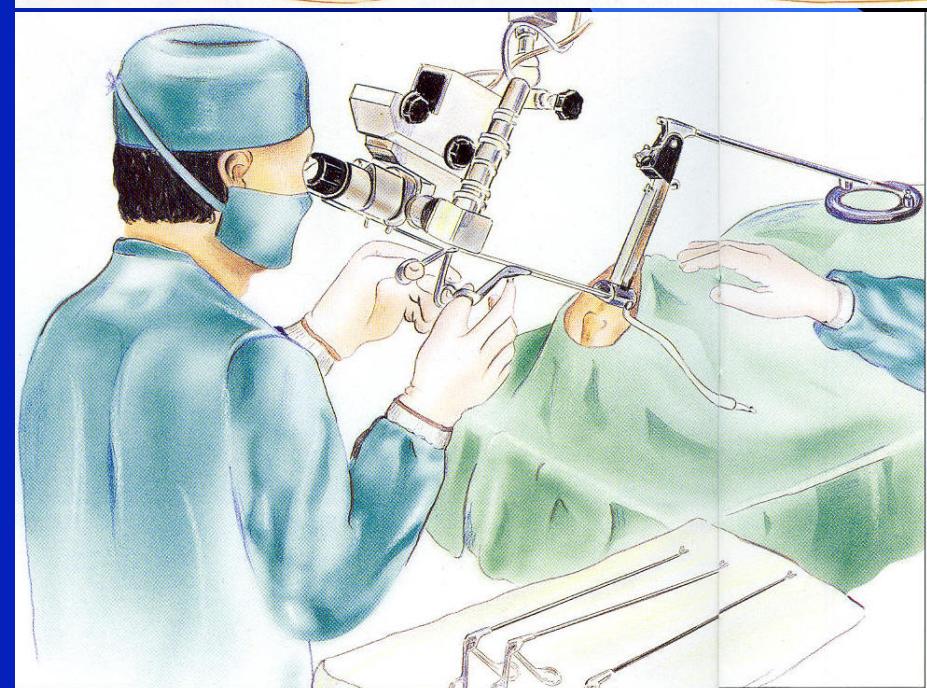

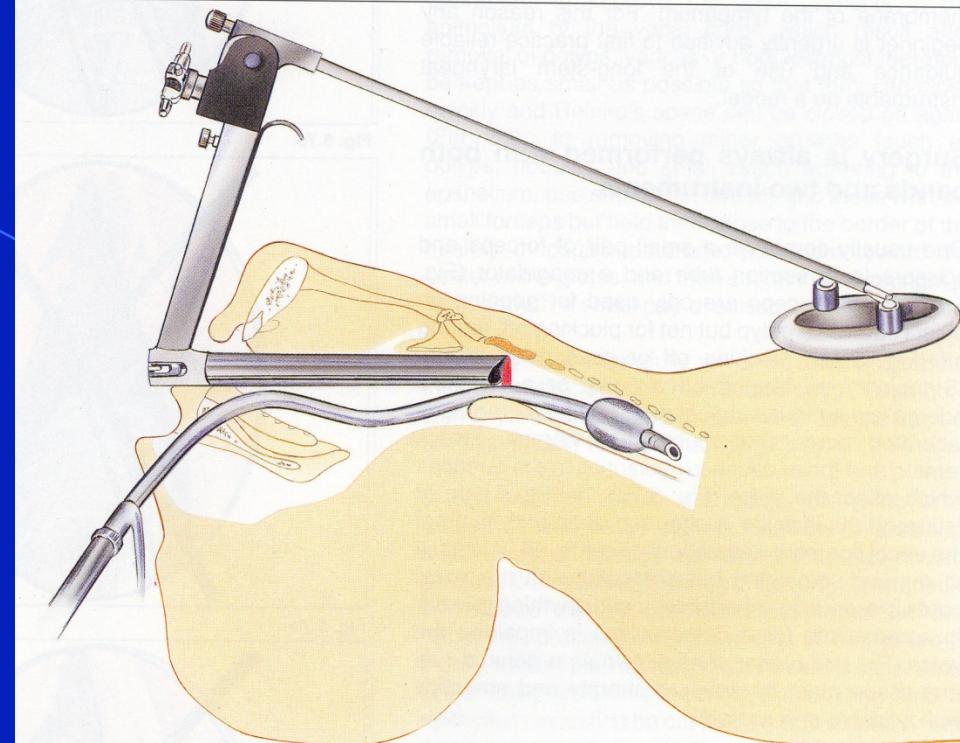

Laryngitis chron. hyperplastica

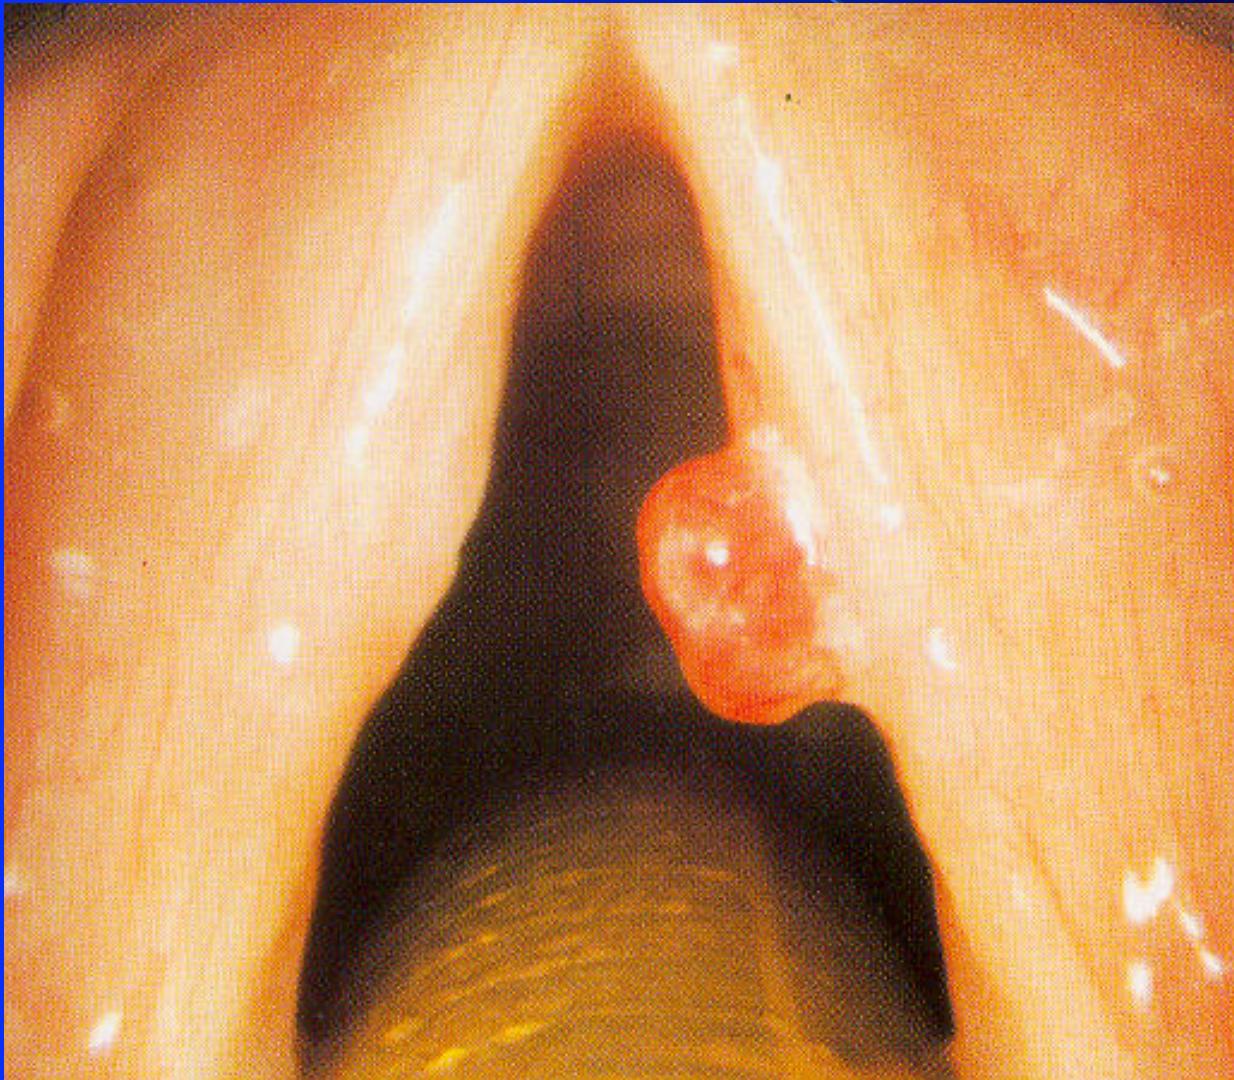

Polypus laryngis

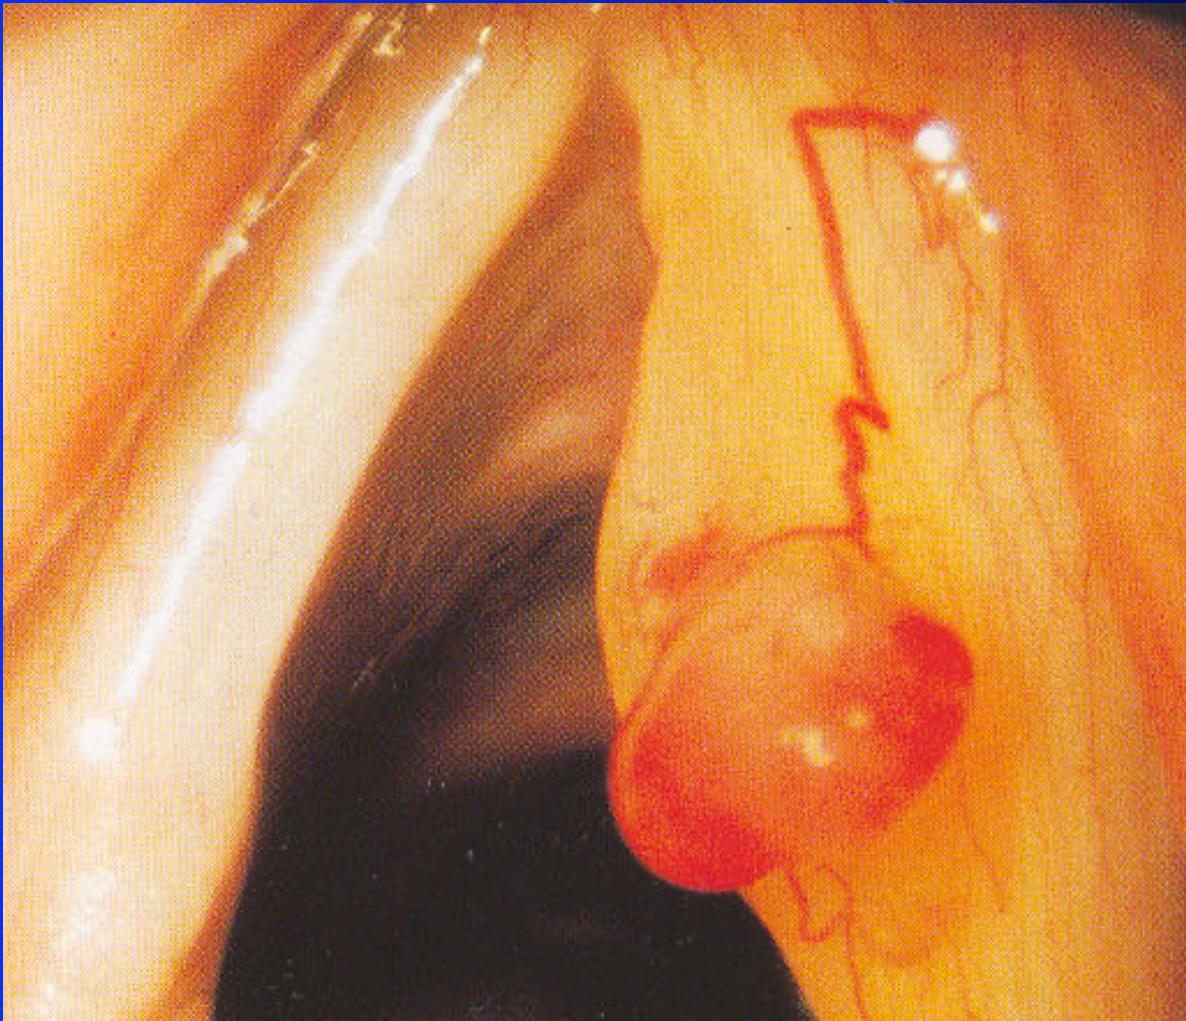

Microlaryngoscopy sec. Kleinsasser

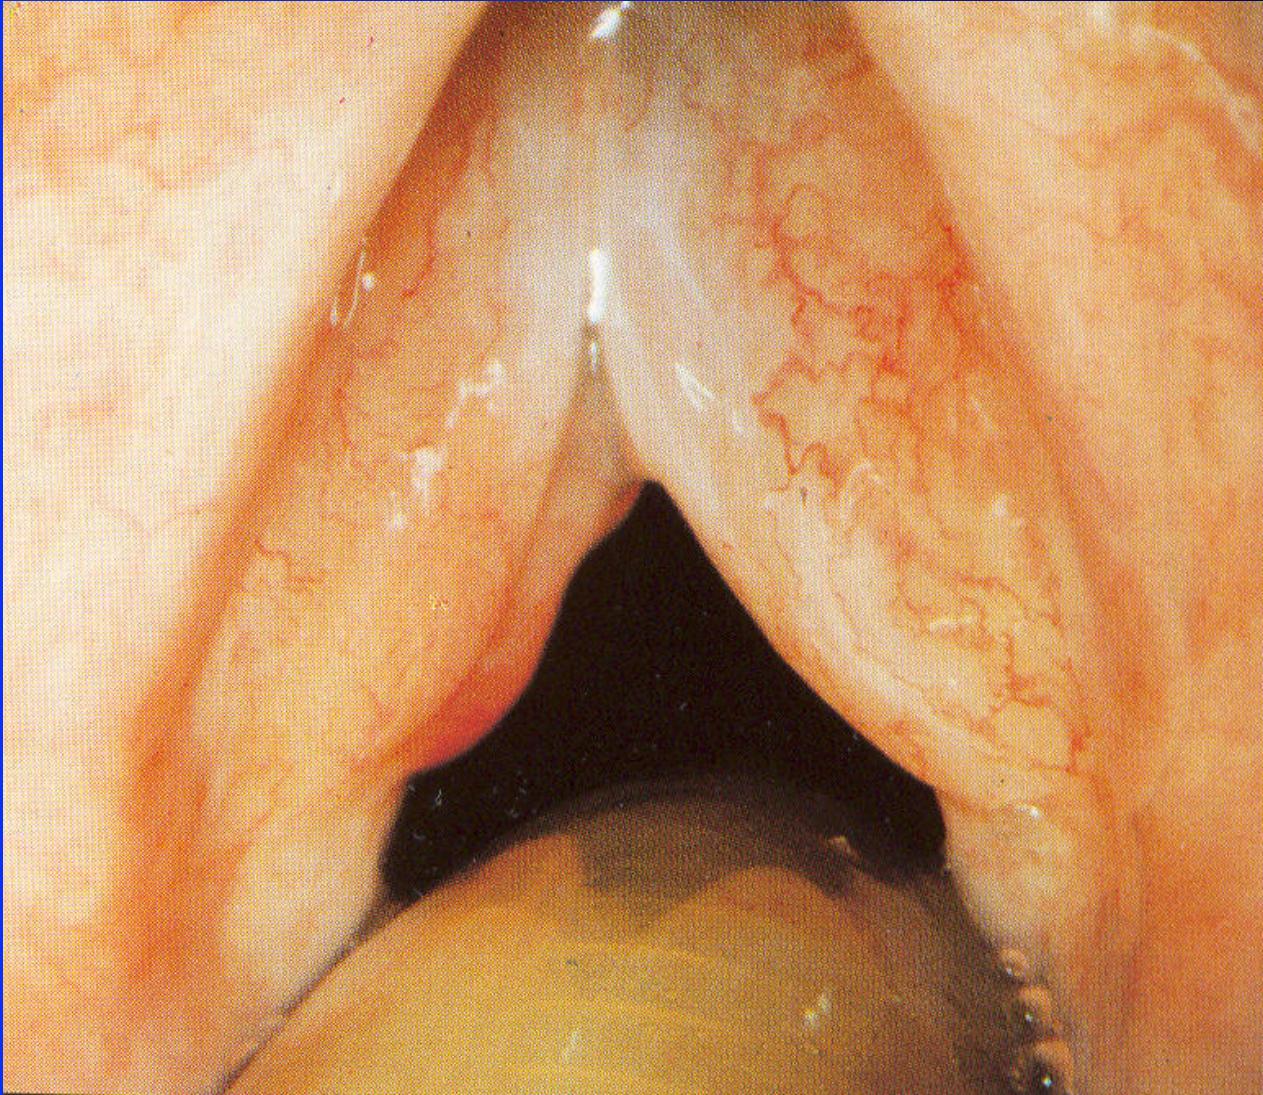

Polypus plicae vocalis l.dx.

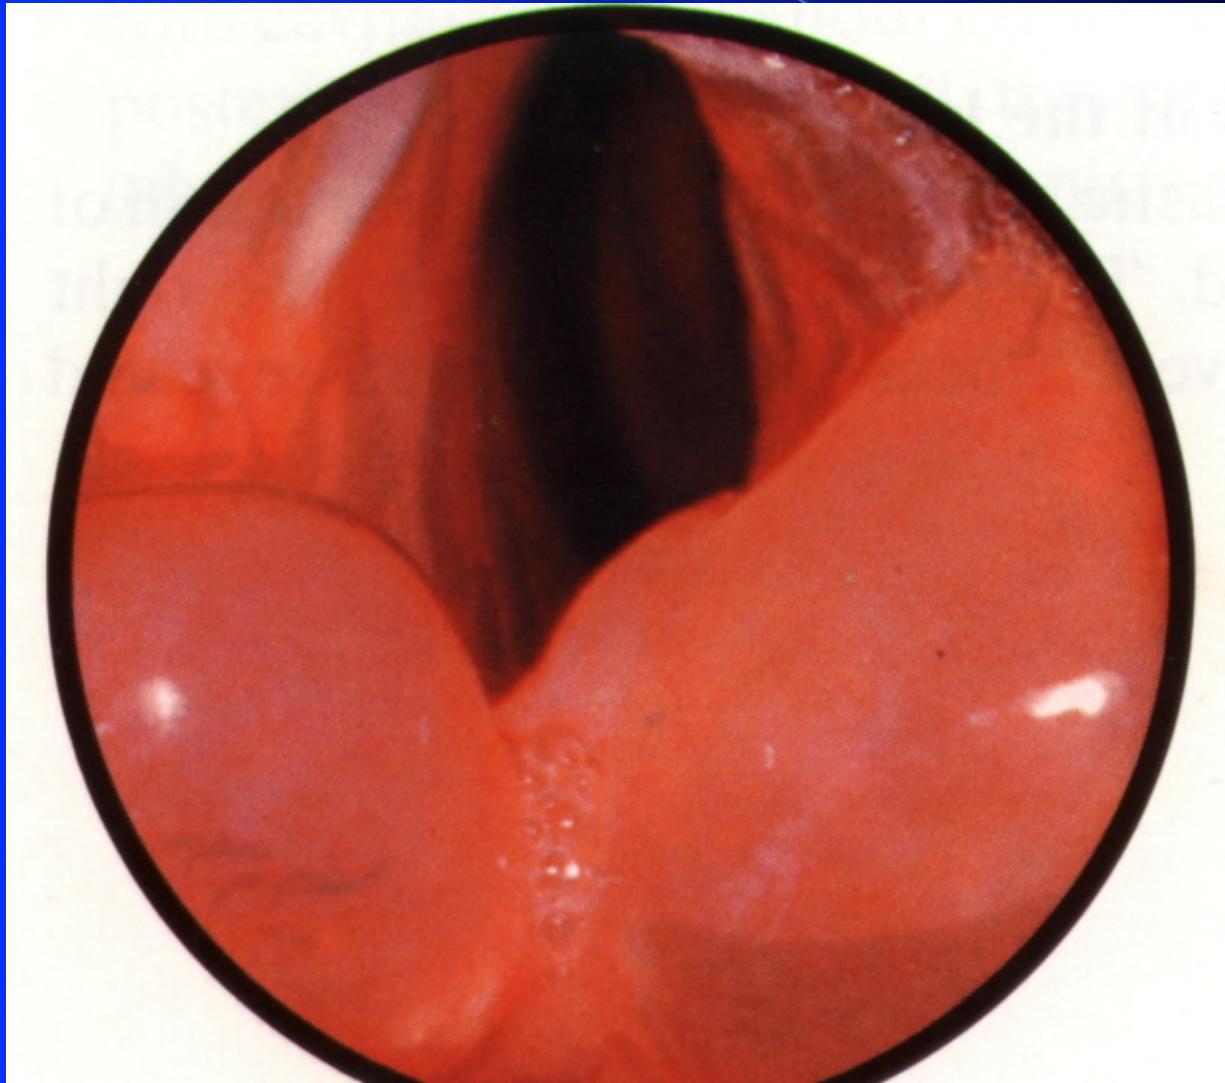

Polypus plicae vocalis l.dx.

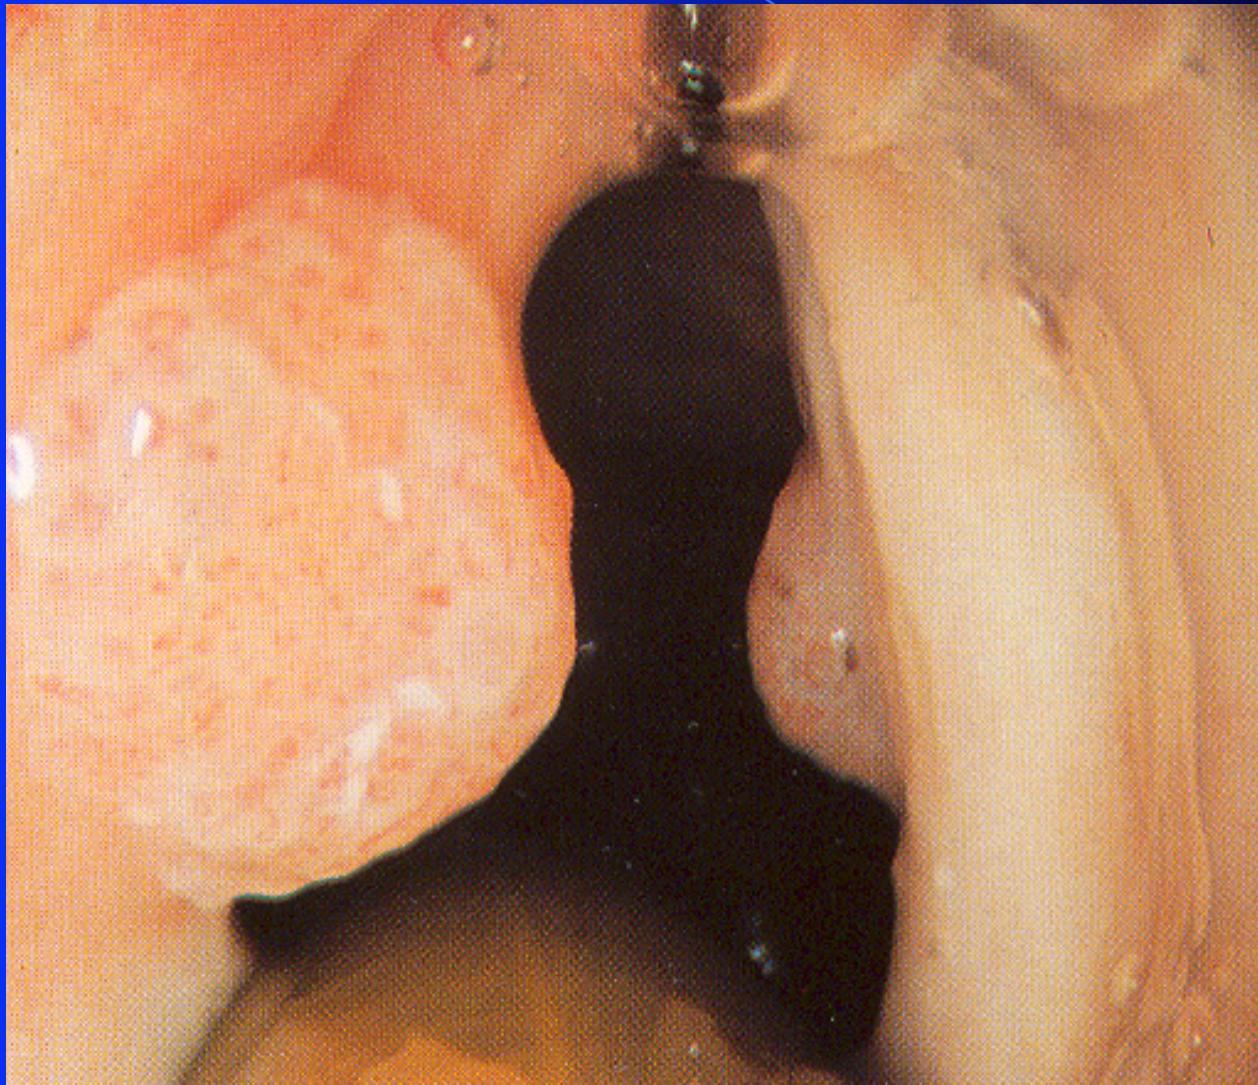

LARYNGITIS CHRONICA- OEDEMA REINCKE

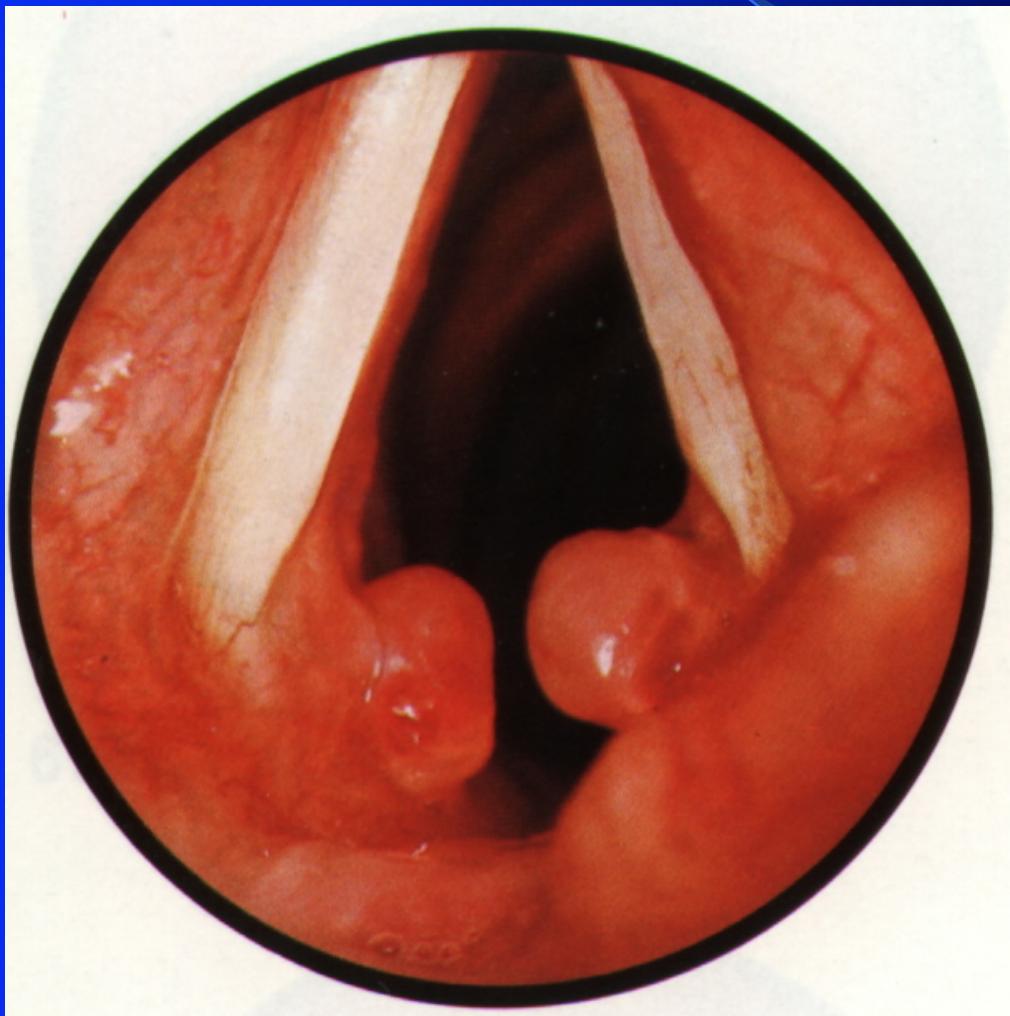

Oedema laryngis

Papilomatosis laryngis, HPV virosis

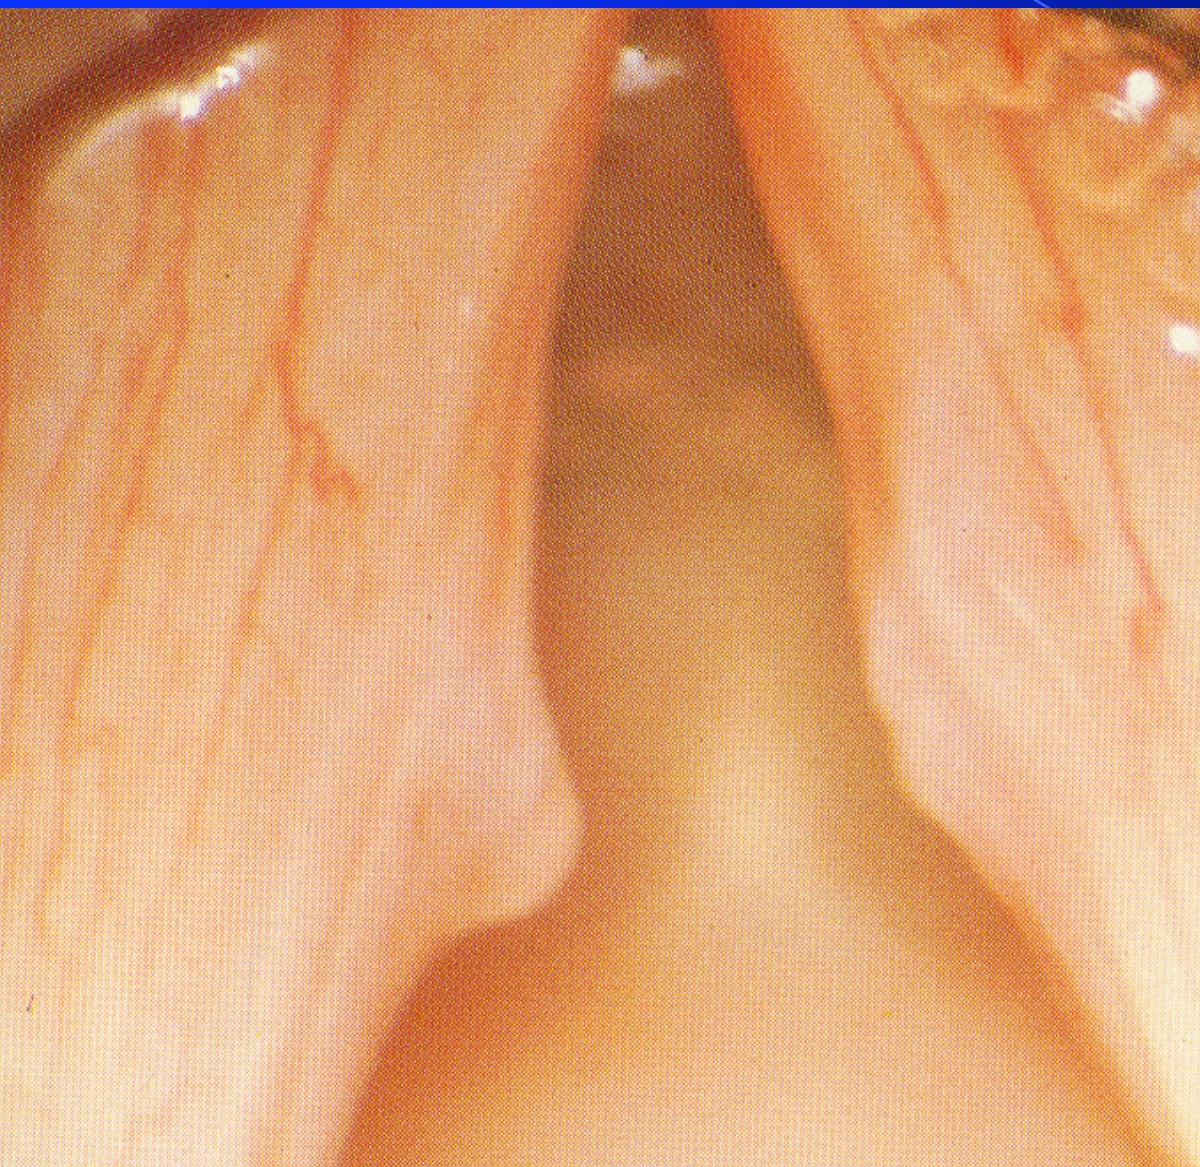

Intubation injury, granulomas

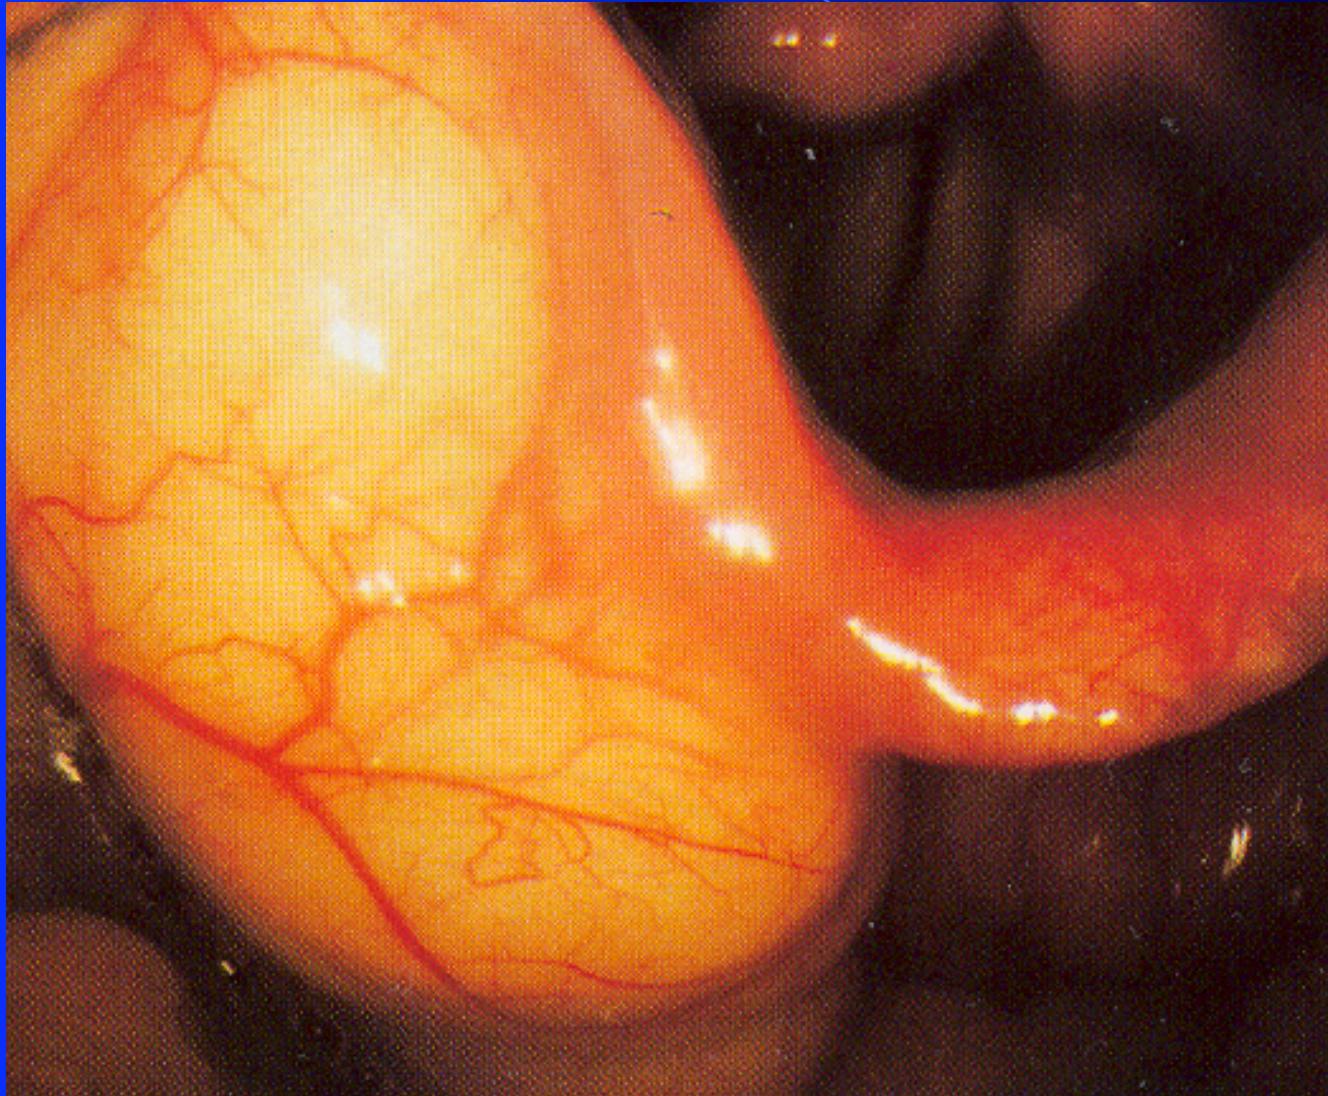

Noduli cantatorii

vocal abuse, dysphonia, pain on speaking

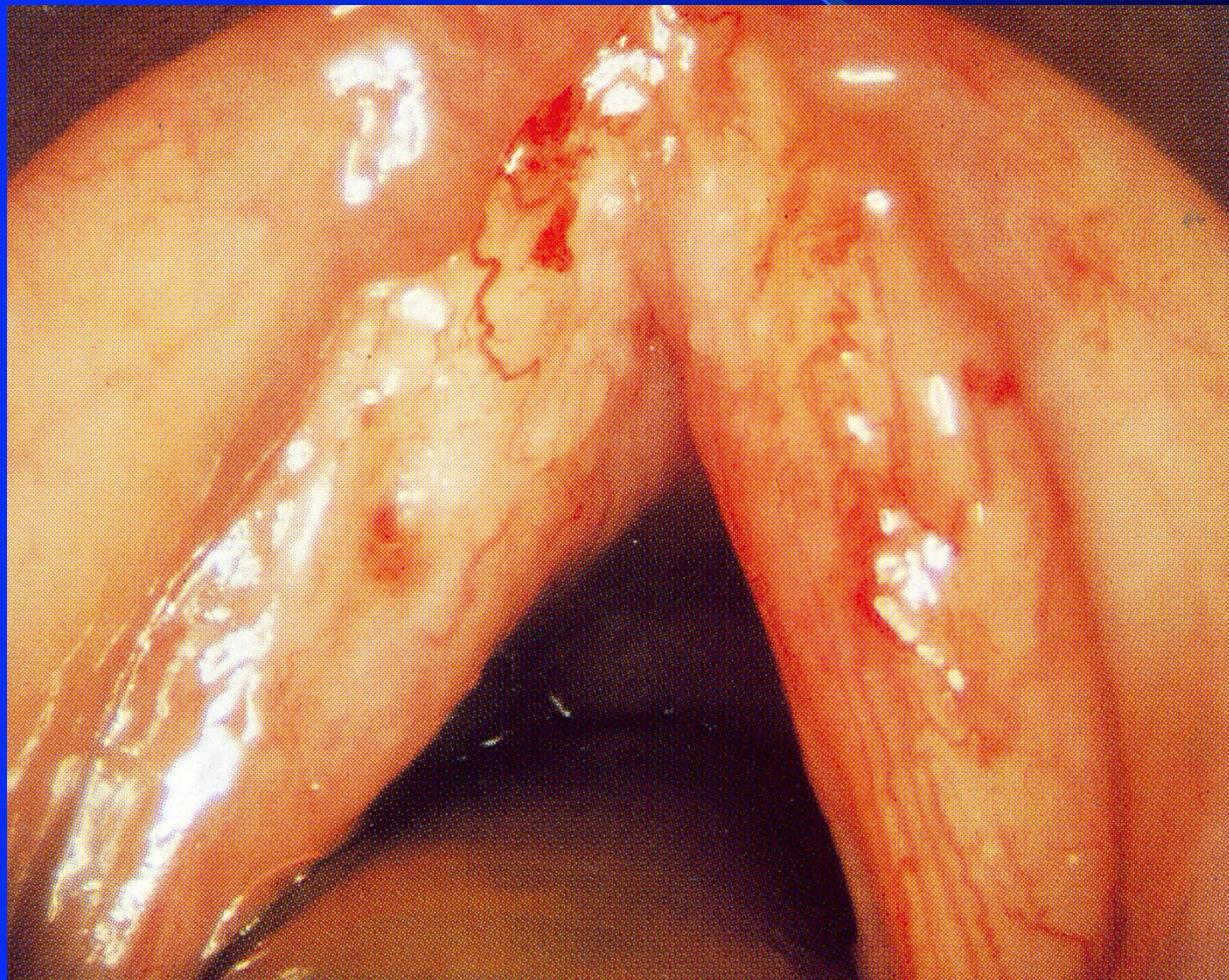

- **in voice professionals**
- **microlaryngoscopy**
- **strict voice rest**

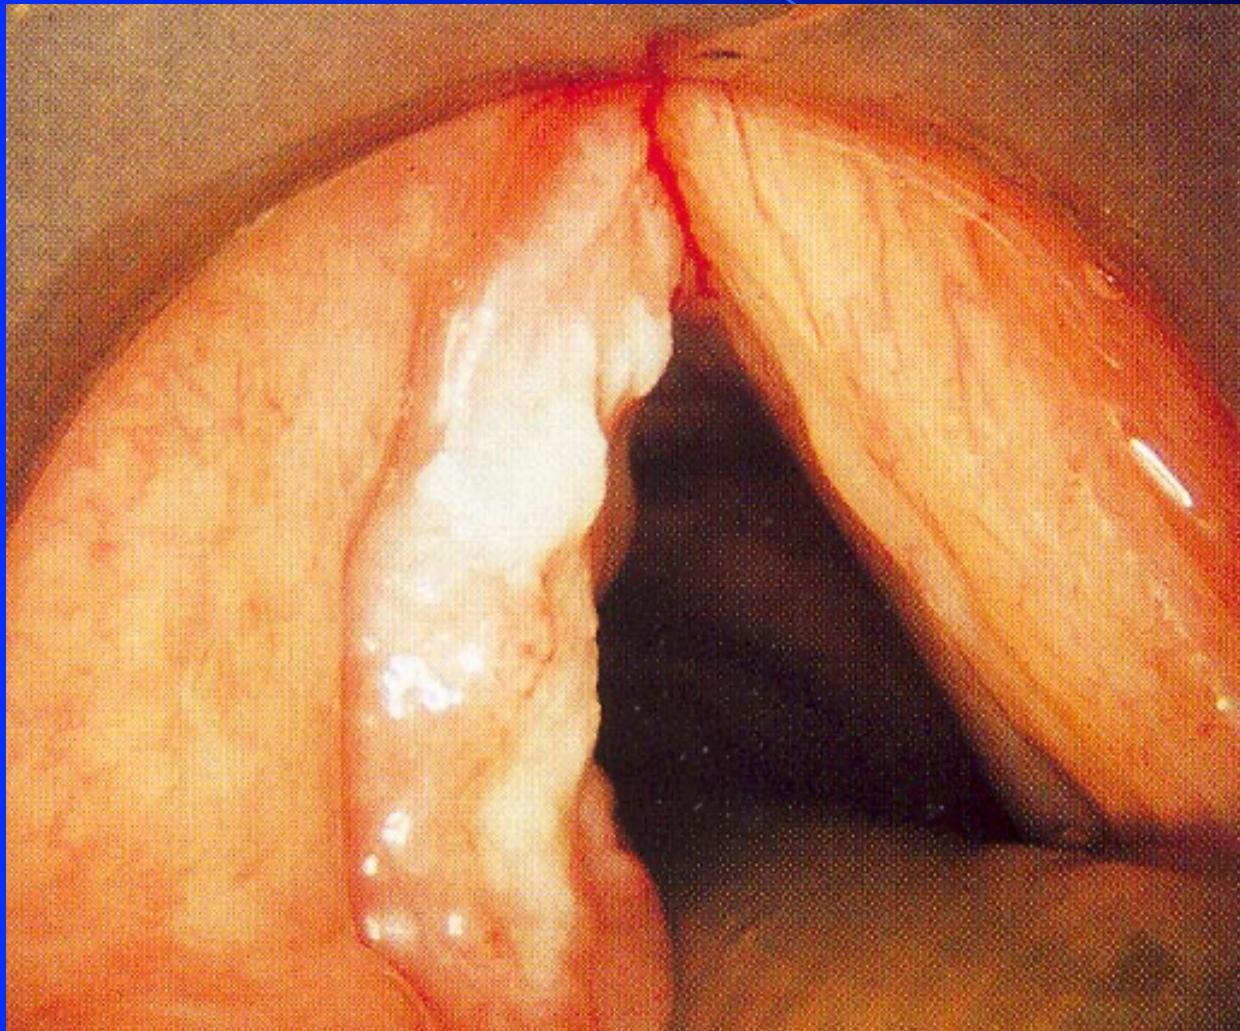

Cystis epiglottidis

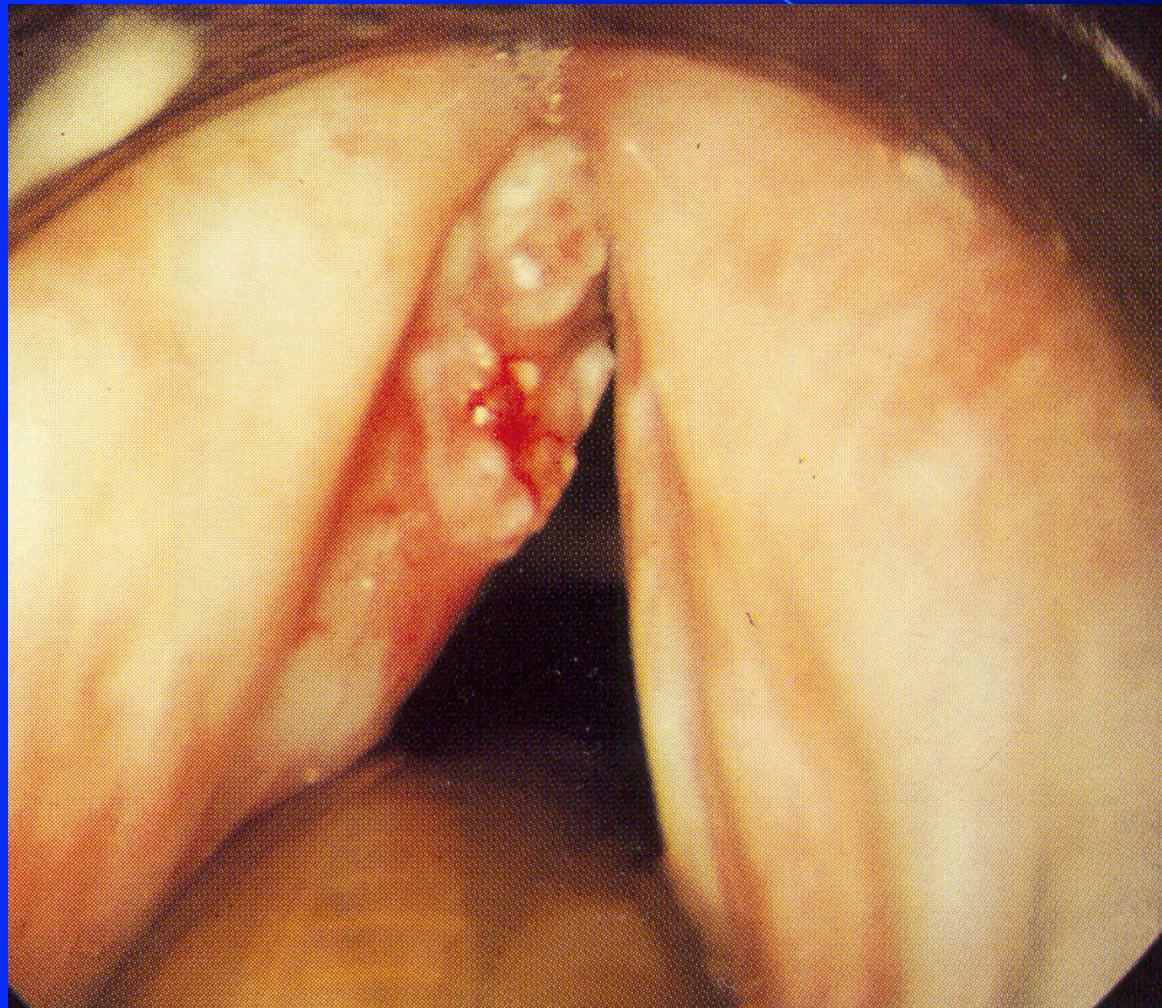

Ca in situ bilat

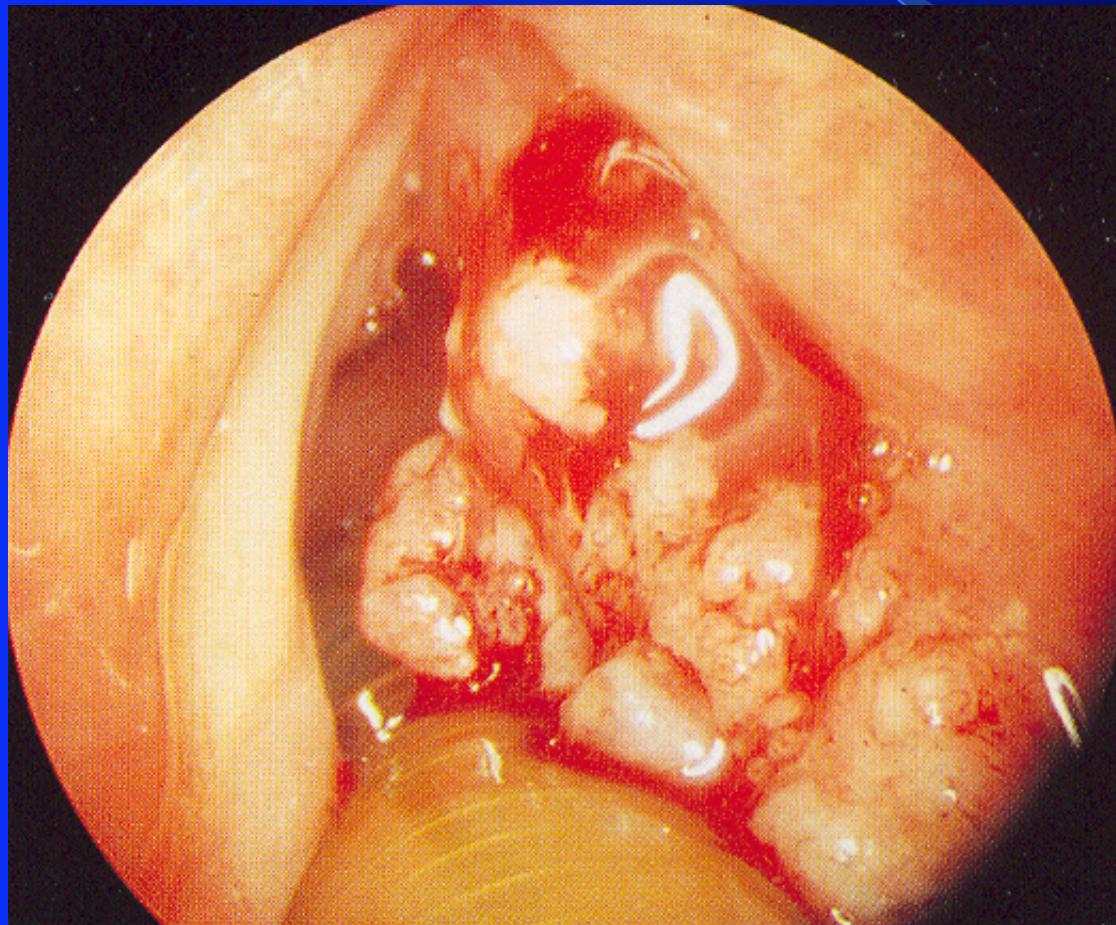

Ca spino plicae voc. l.sin. T1

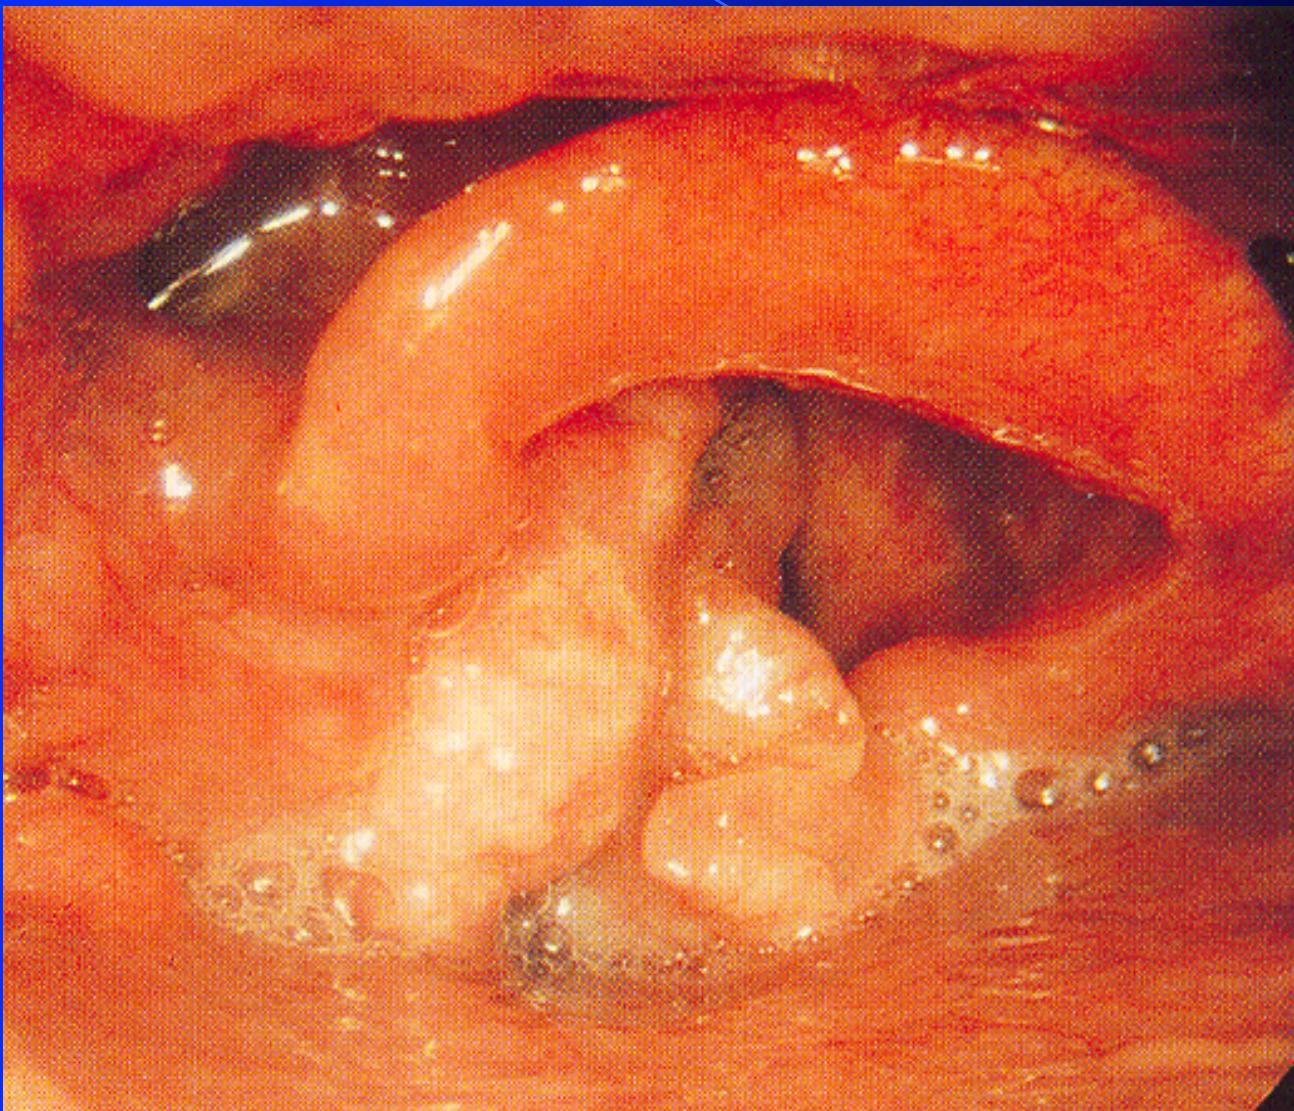

Ca spino plicae voc. l.sin. T2

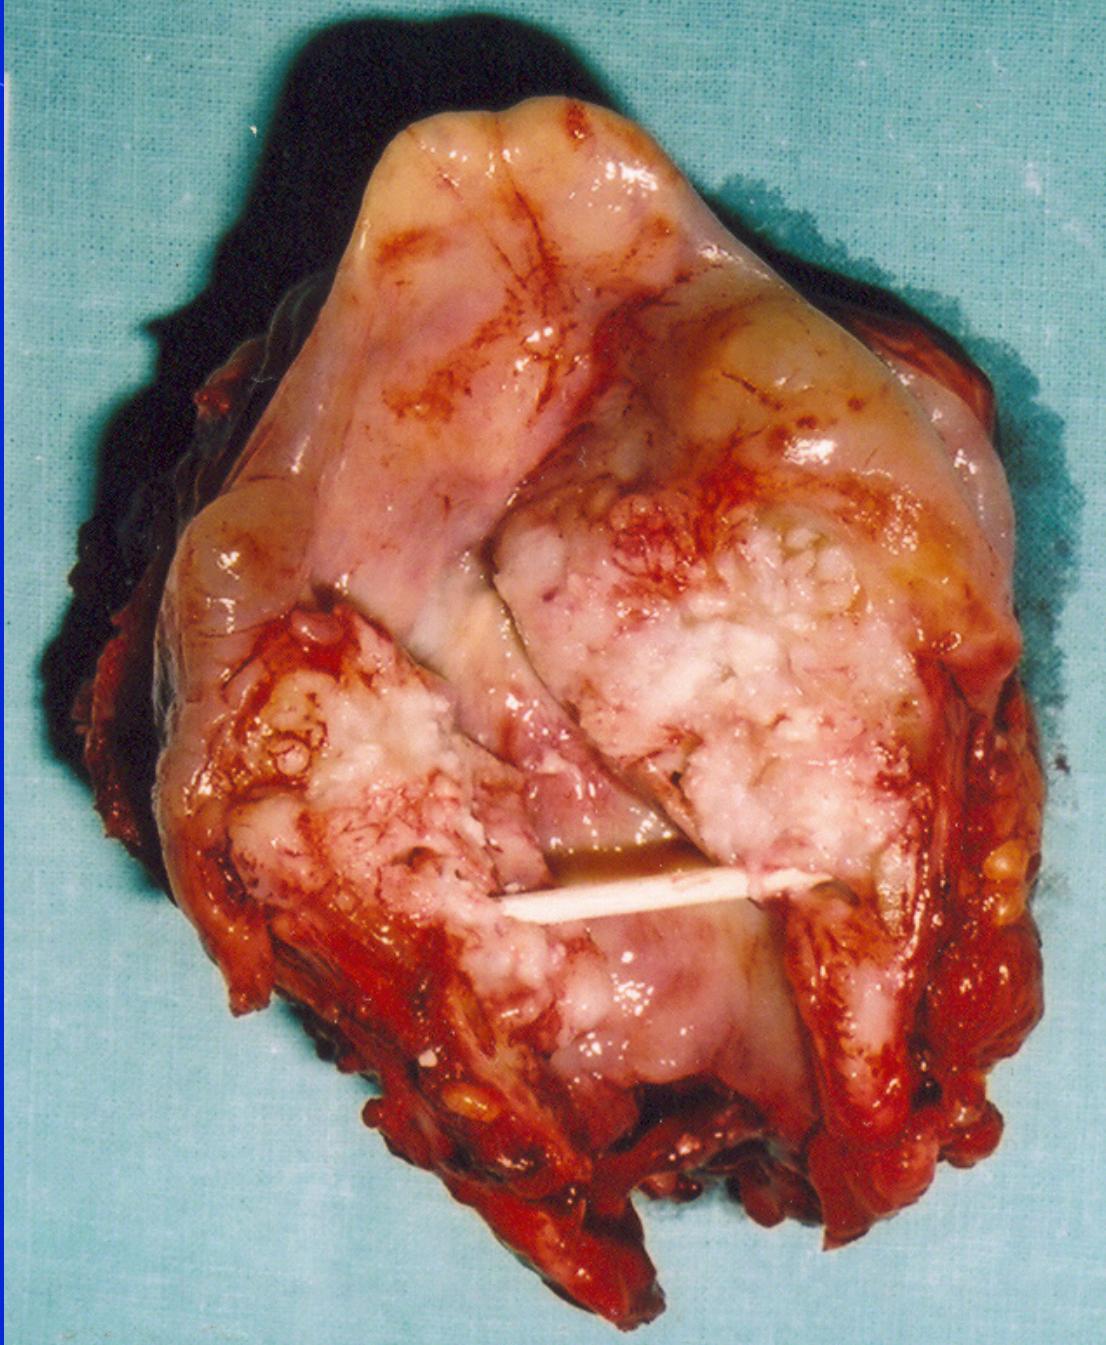

Ca spino plicae voc. l.sin. T3

Ca spino sinus piriformis

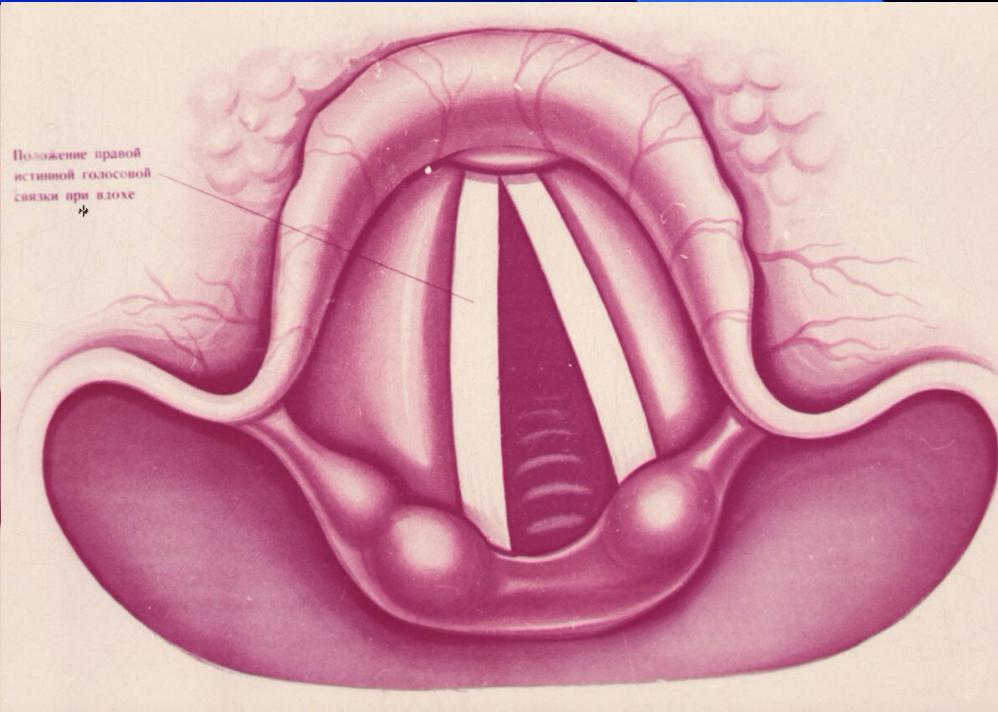

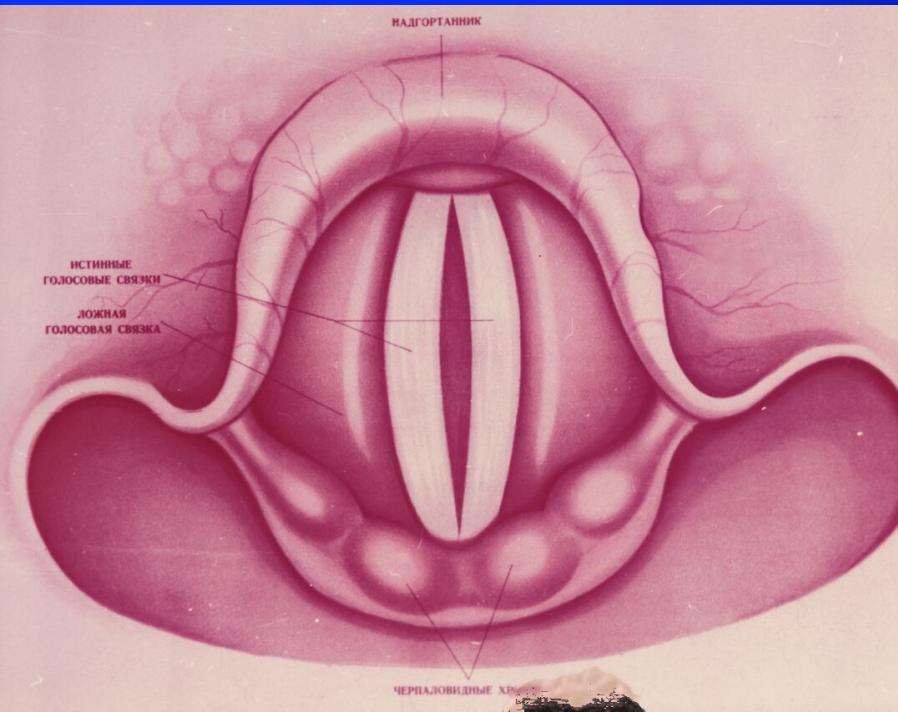

Ca glottis

Disorder of laryngeal motivity

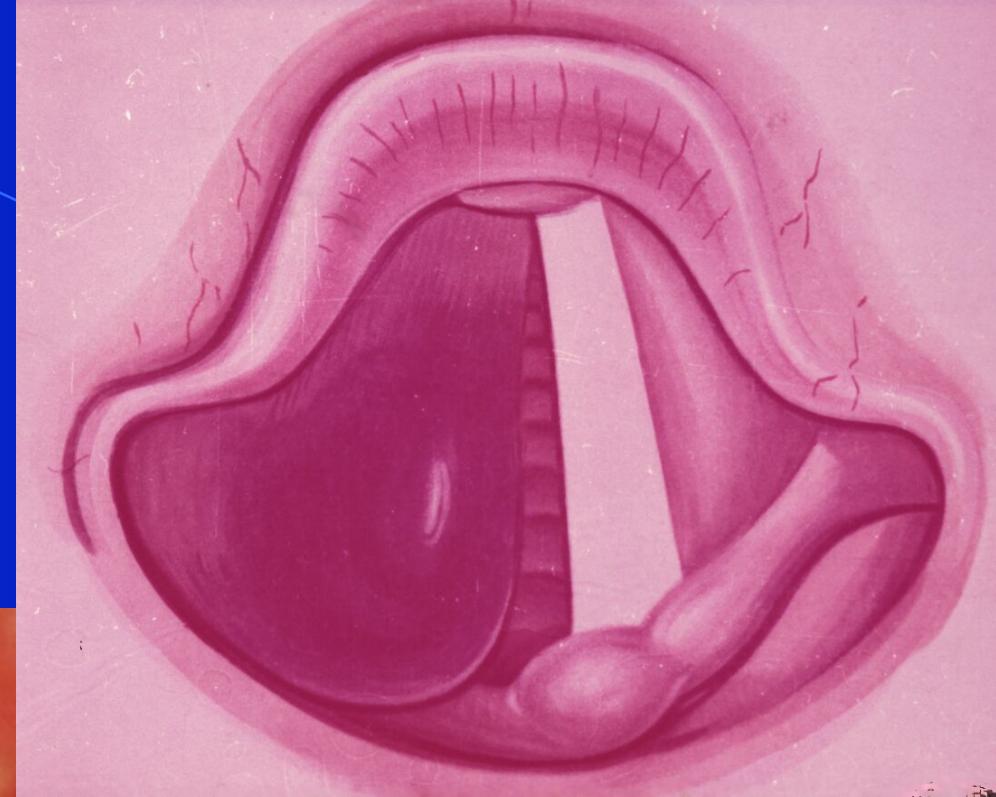

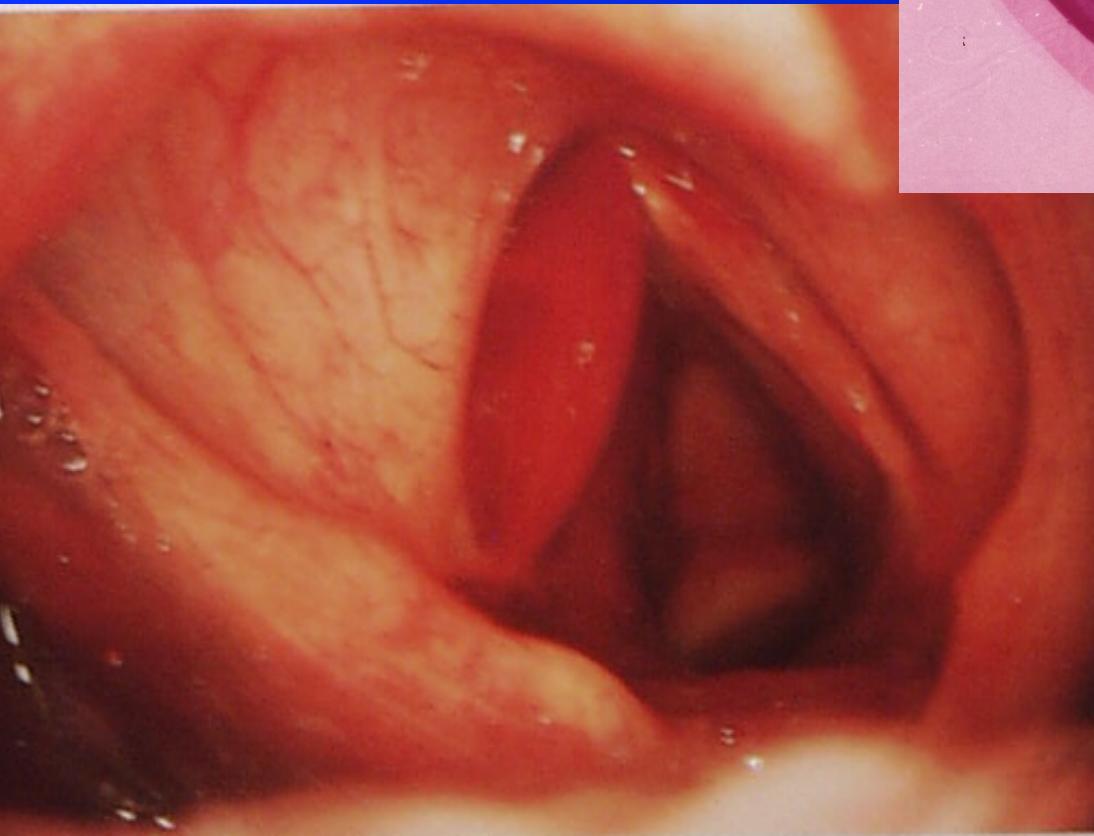

Seeman-Rosenbach rule – in insidious toxic influence on recurrent nerve - first damaged fibers phylogenetically younger (for m. posticus)

Laryngeal injury – symptoms, diagnosis

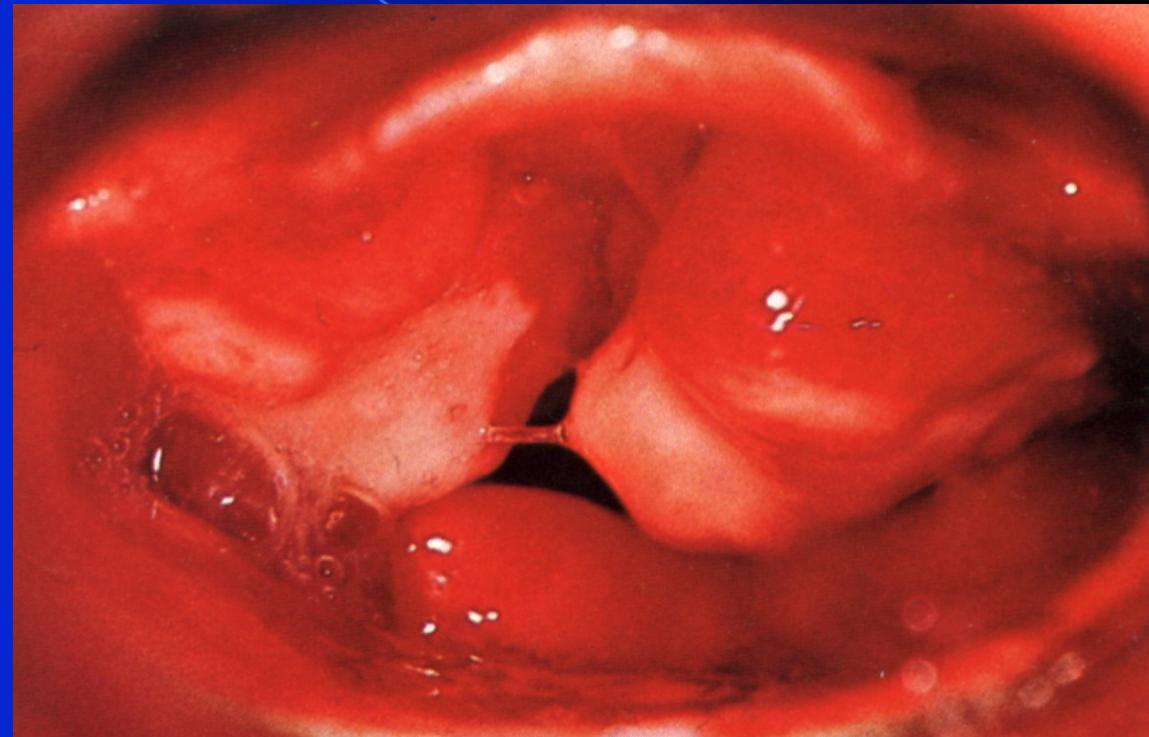

- **Dyspneu**
- **Dysphonia**
- **Bleeding** – not very extensive
- **Dysphagia** – in connection to injury of pharyngeal and esophageal muscles

Hematoma of right vocal cord

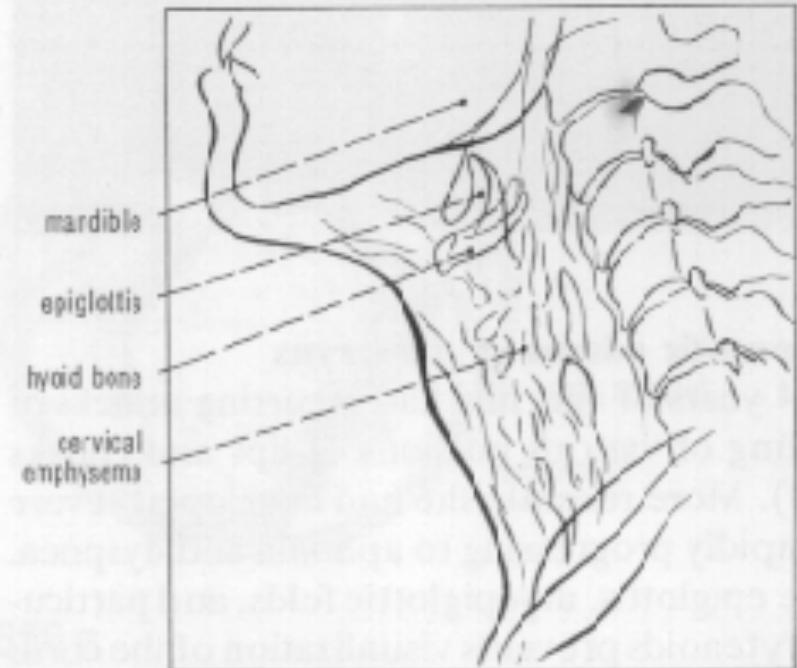

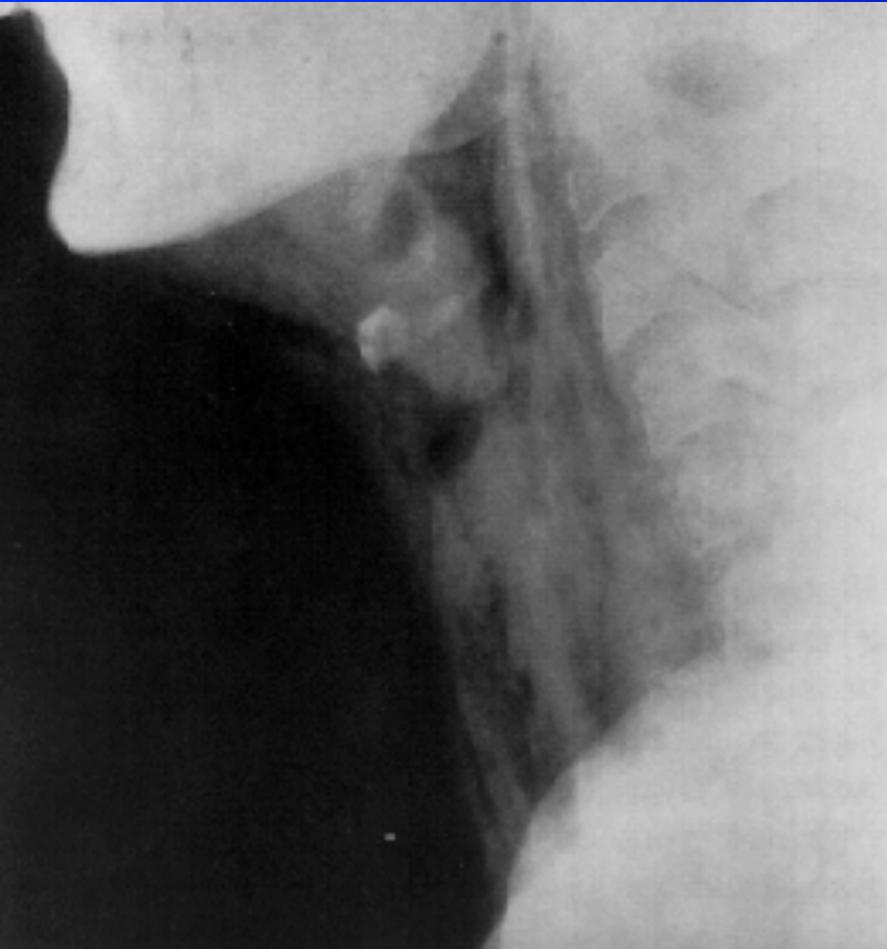

Fractura of laryngeal skeleton

Laryngeal fracture
with a mucosal
hematoma and
dislocation of
the arytenoid

Laryngeal fracture , neck emphysema

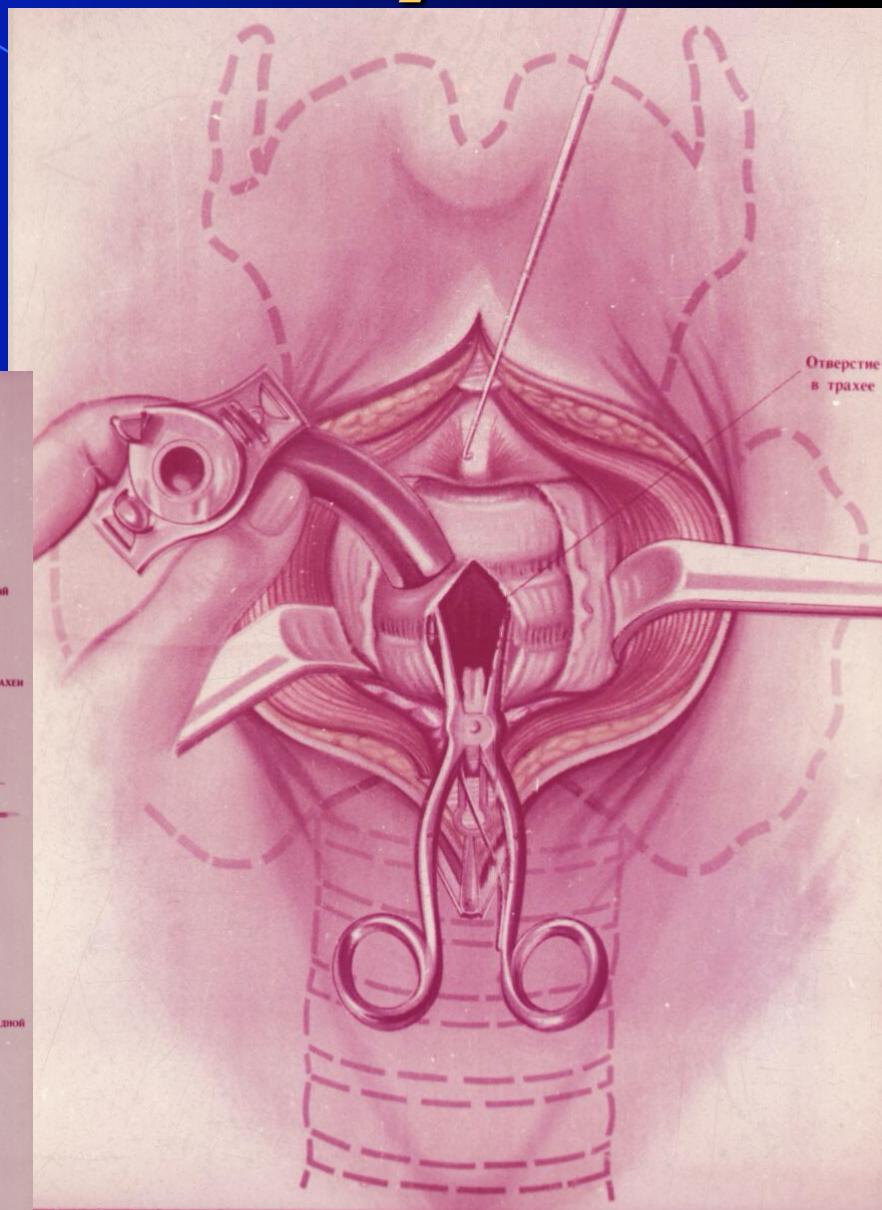

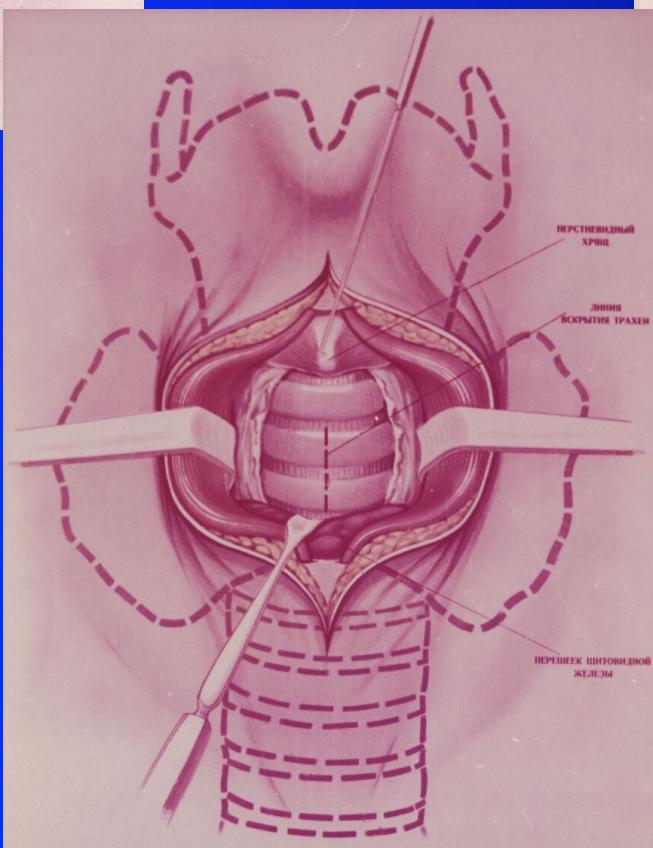

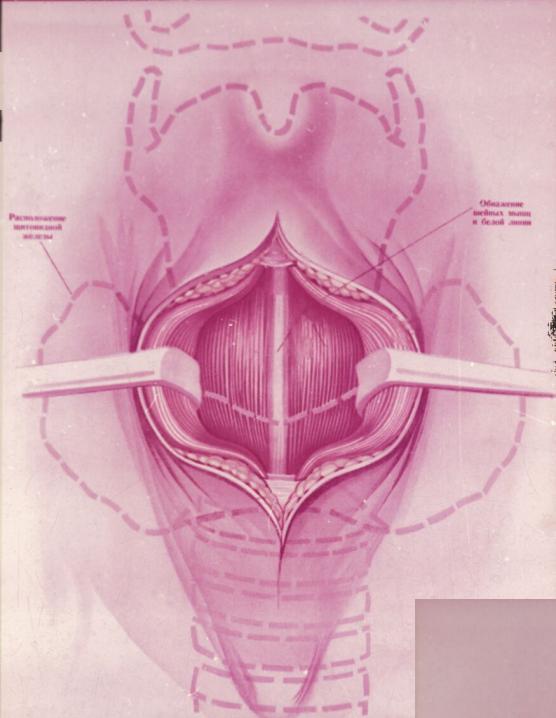

External laryngeal injury, first physician aid

- **Anti- shock treatment**
- **care for airway**
- **Management of bleeding**

Light injury (blunt trauma) conservative treatment-

- 1) antihistaminics, corticosteroids, antibiotics, analgetics, oxygen**
- 2) cold compress on neck**
- 3) in dyspnoe – coniotomy, intubation**

Tracheotomy

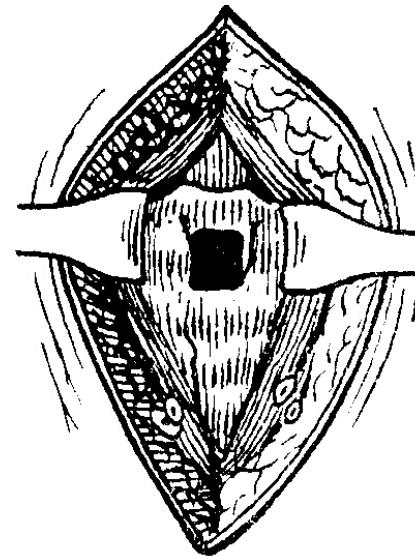

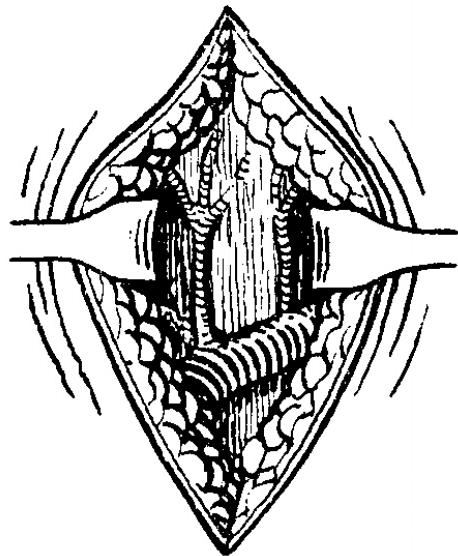

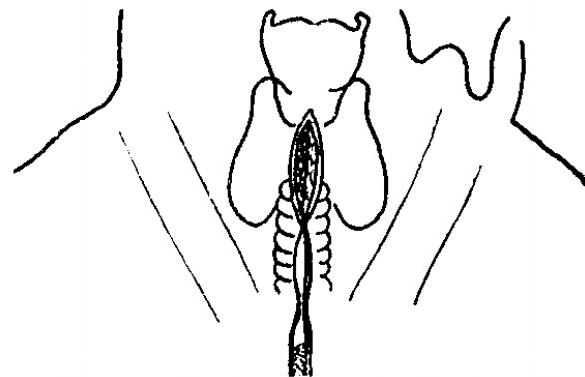

Indication for tracheotomy

„Classic“ – to bridge stenosis caused by inflammation, tumor, foreign body, injury, palsy

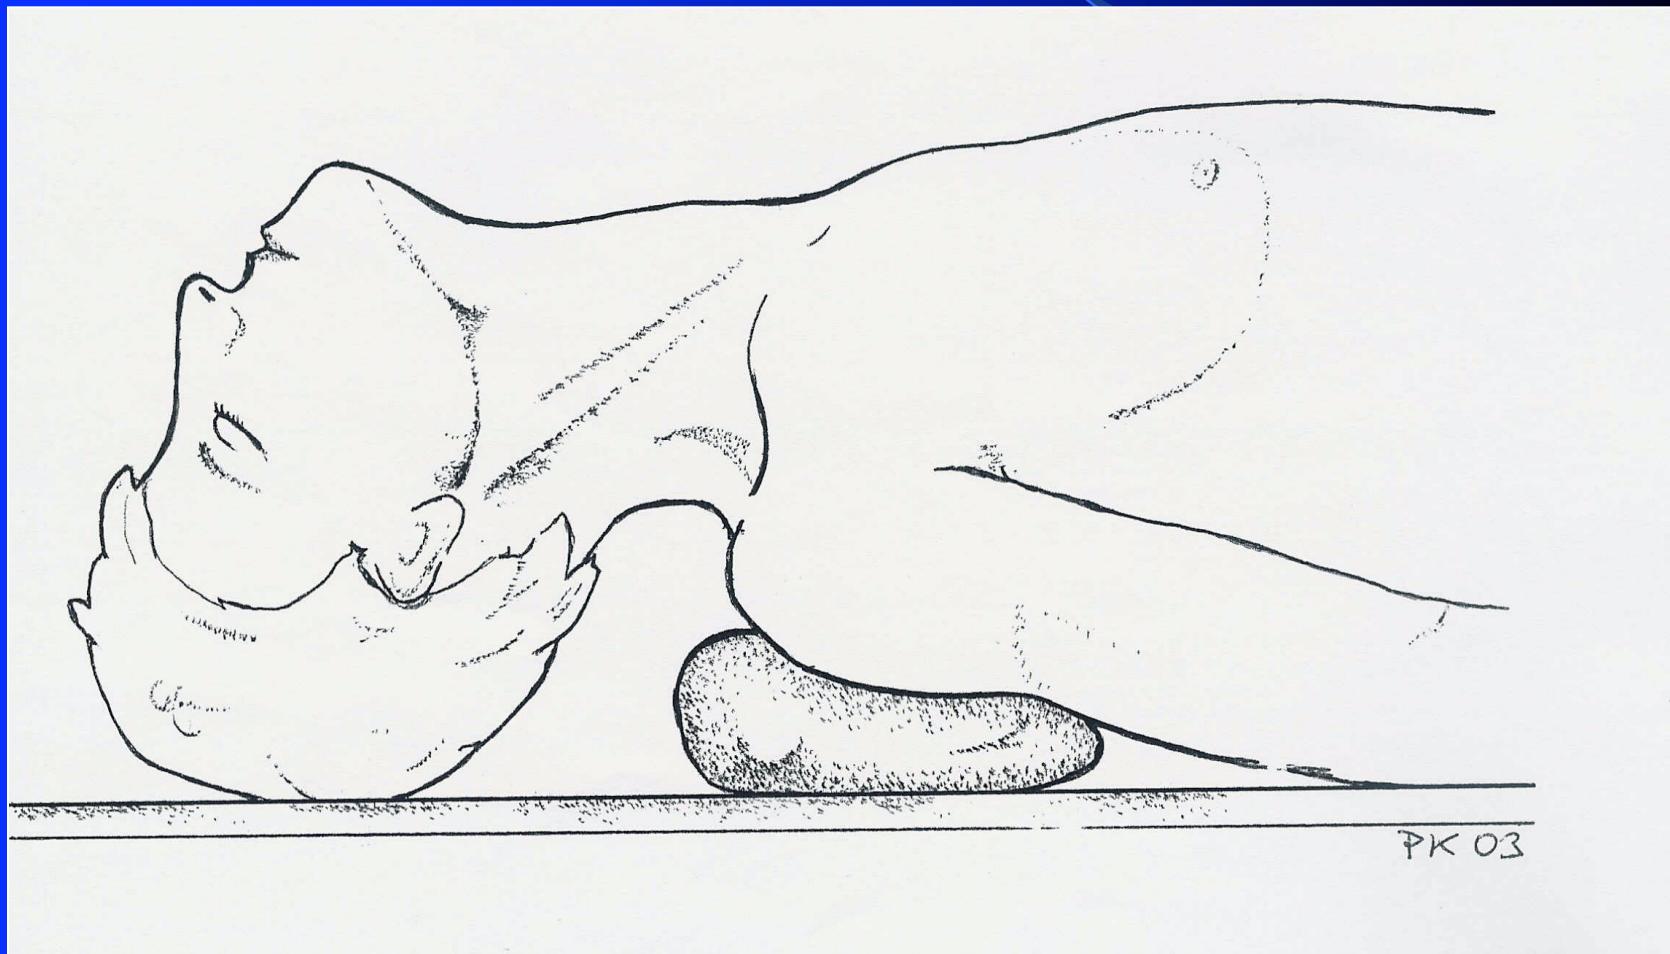

„Prophylactic“ – if we suppose possible stenosis (big surgery, swelling, bleeding, irradiation....)

„Anesthesiologic“ long term intubation of patient (prophylaxis of intubation injury, aspiration; reduction of dead space in airway, suction...etc.)

Tracheotomy

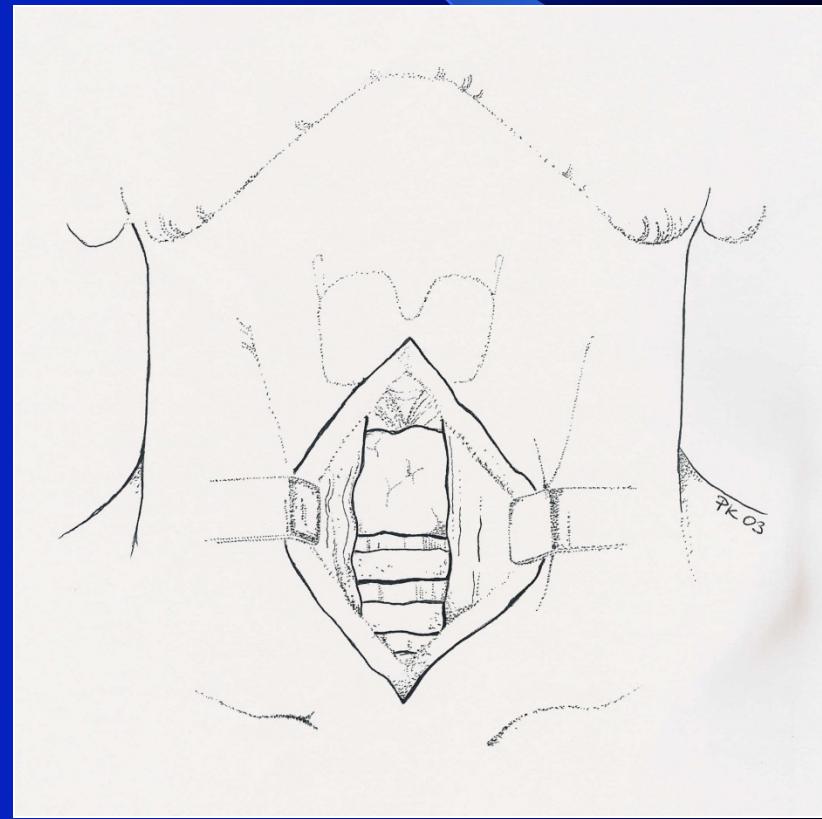

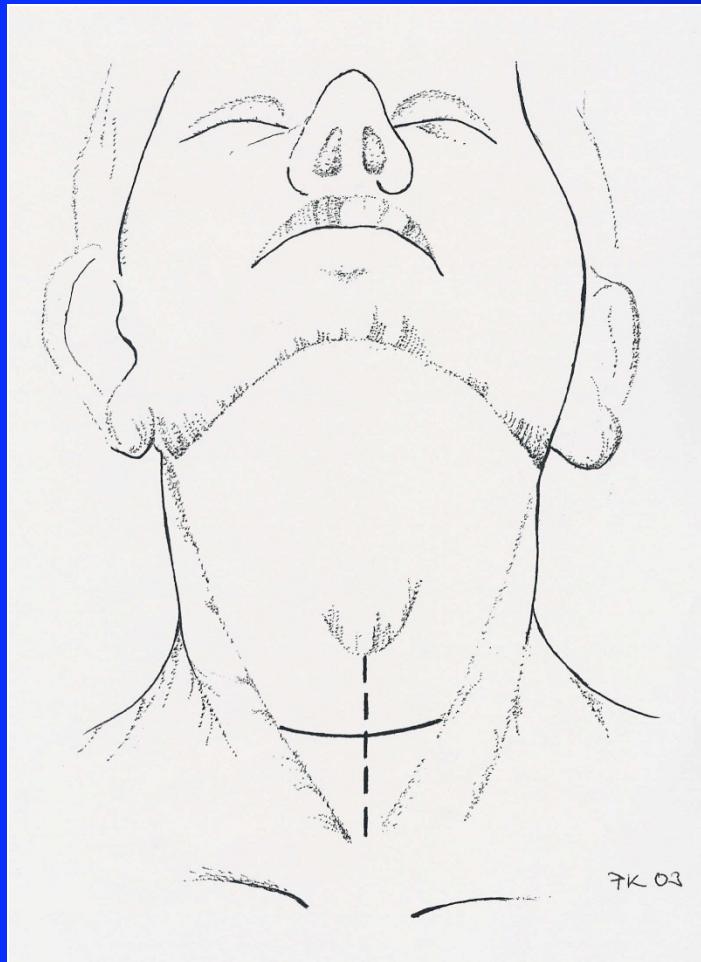

Position in tracheotomy

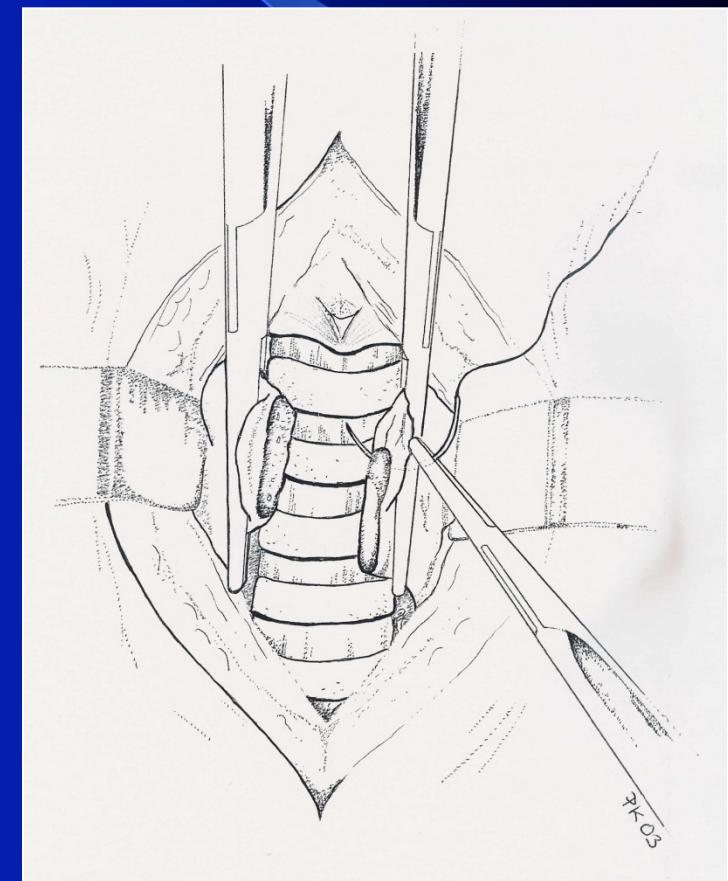

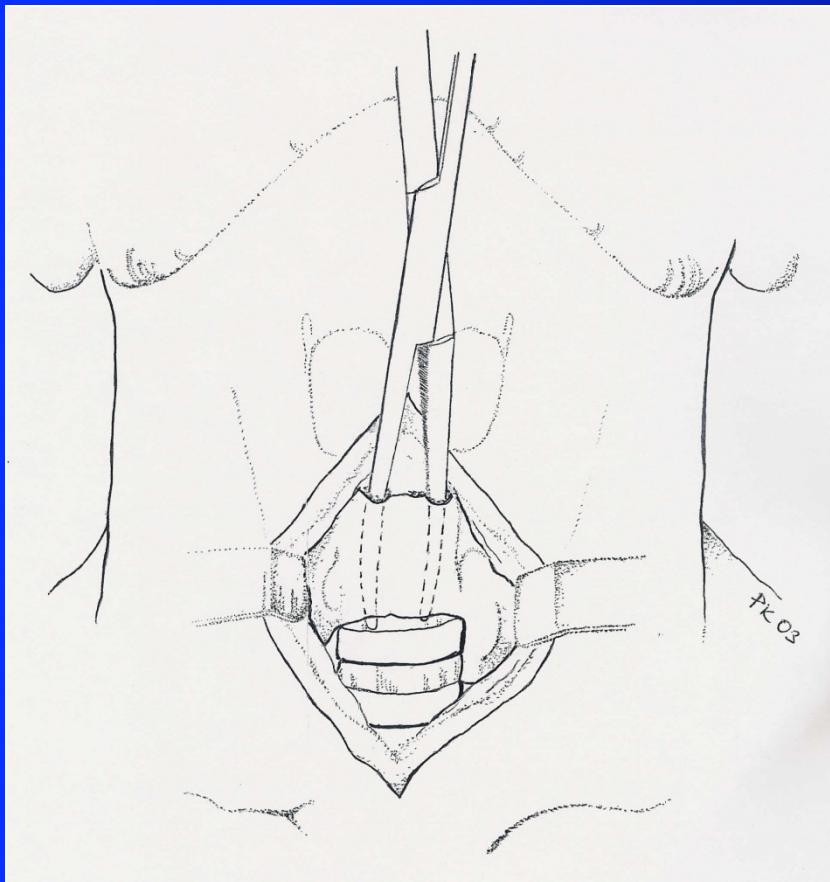

PK 03

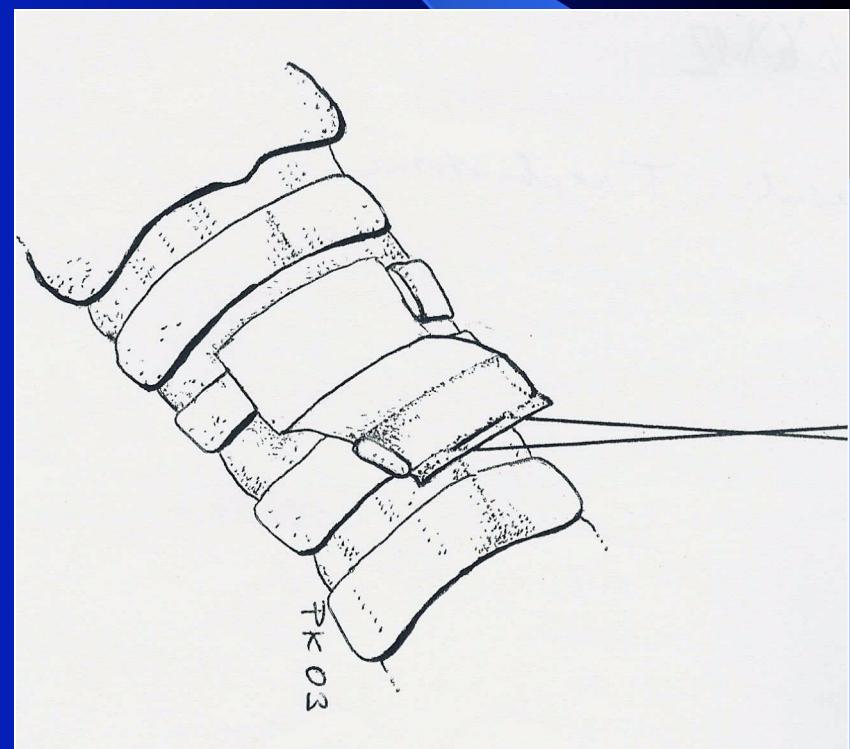

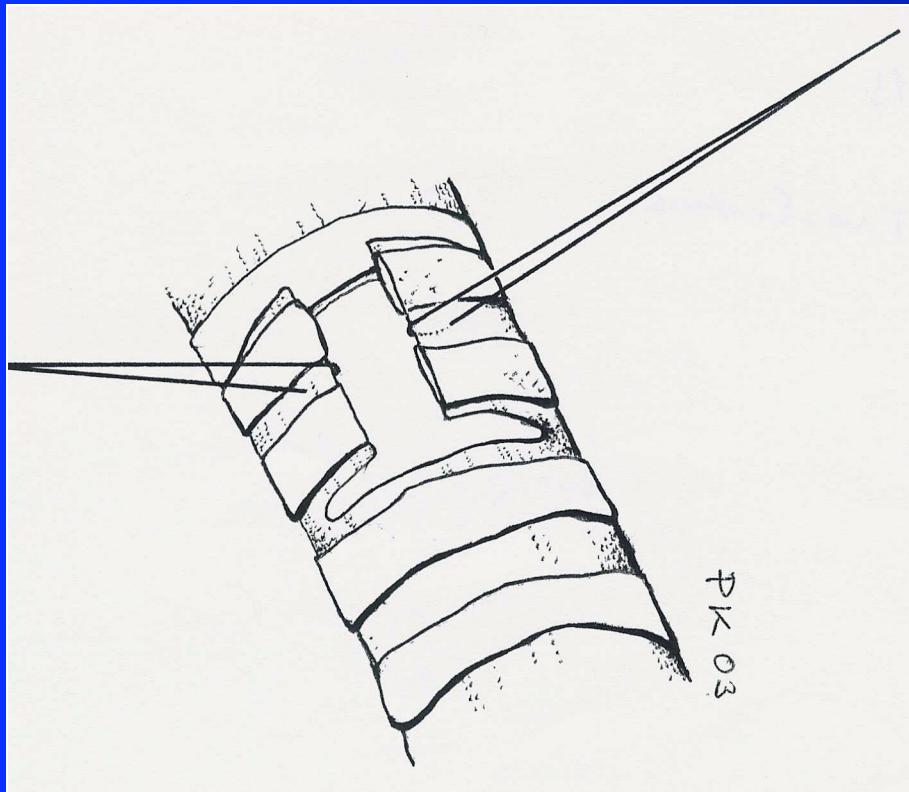

Skin section – horizontal or vertical

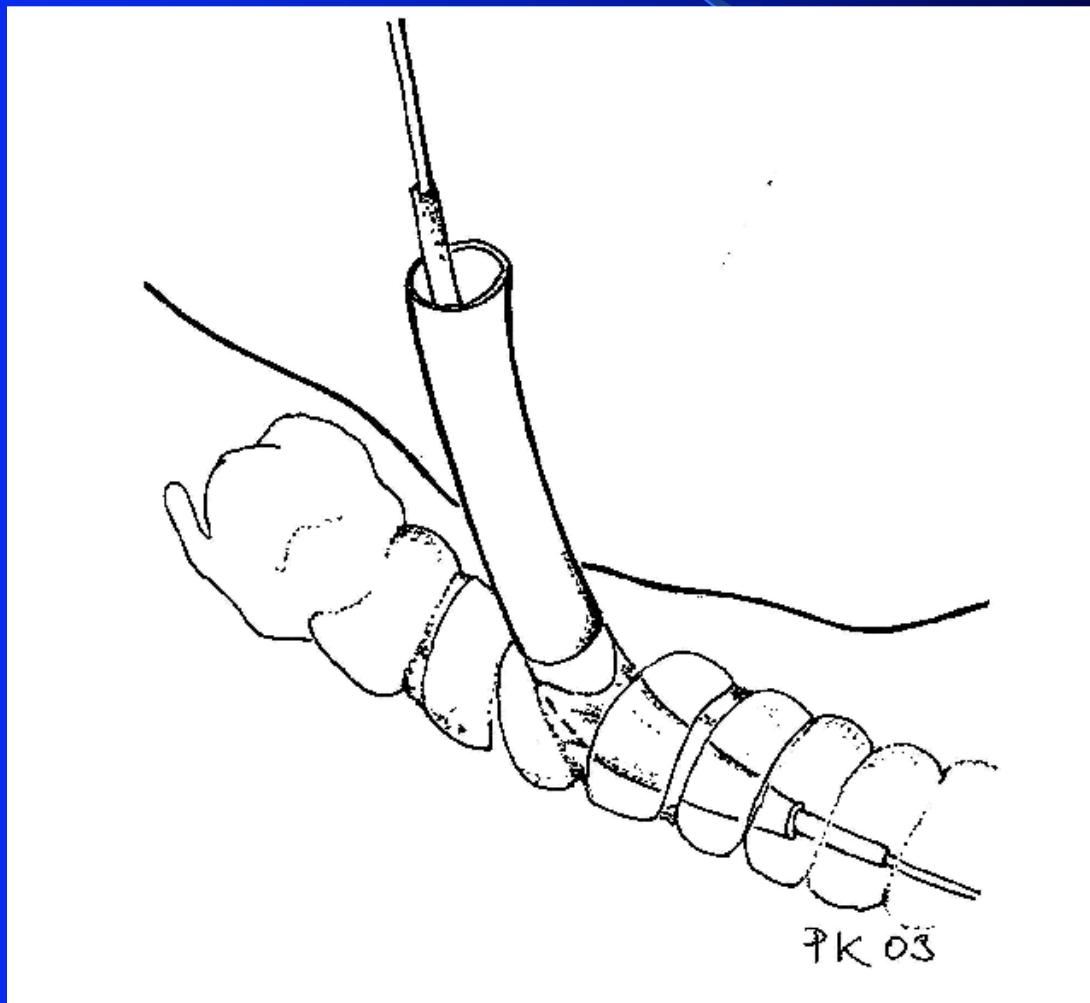

Thyroid gland isthm resection

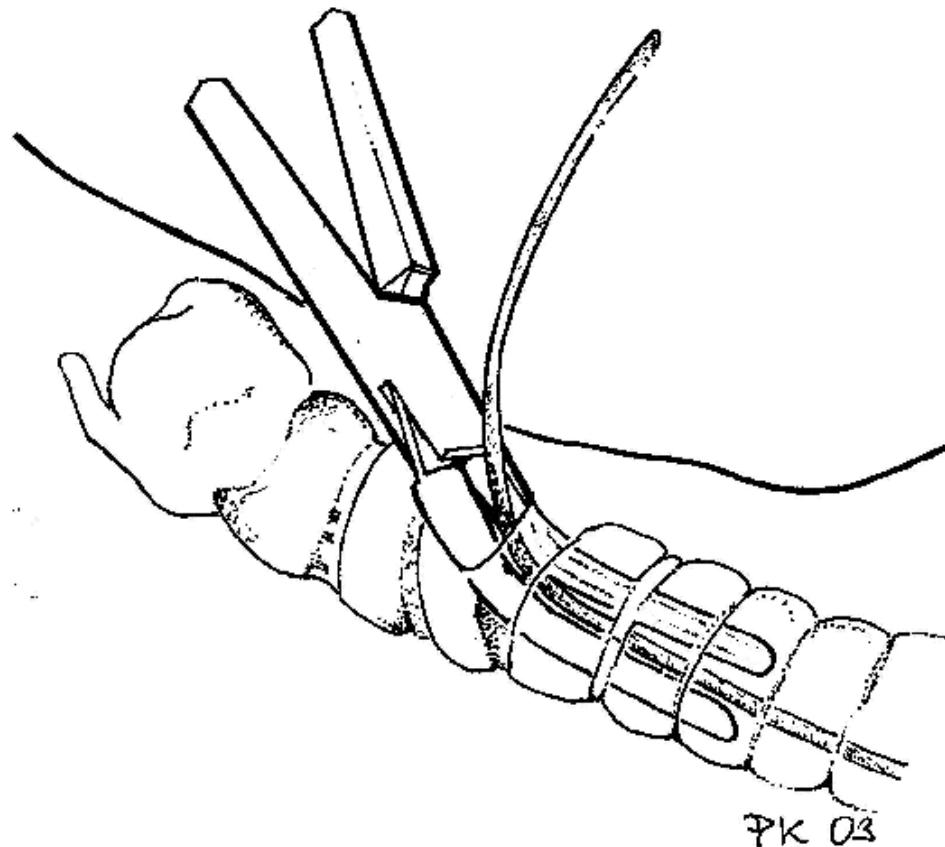

Trachea opening

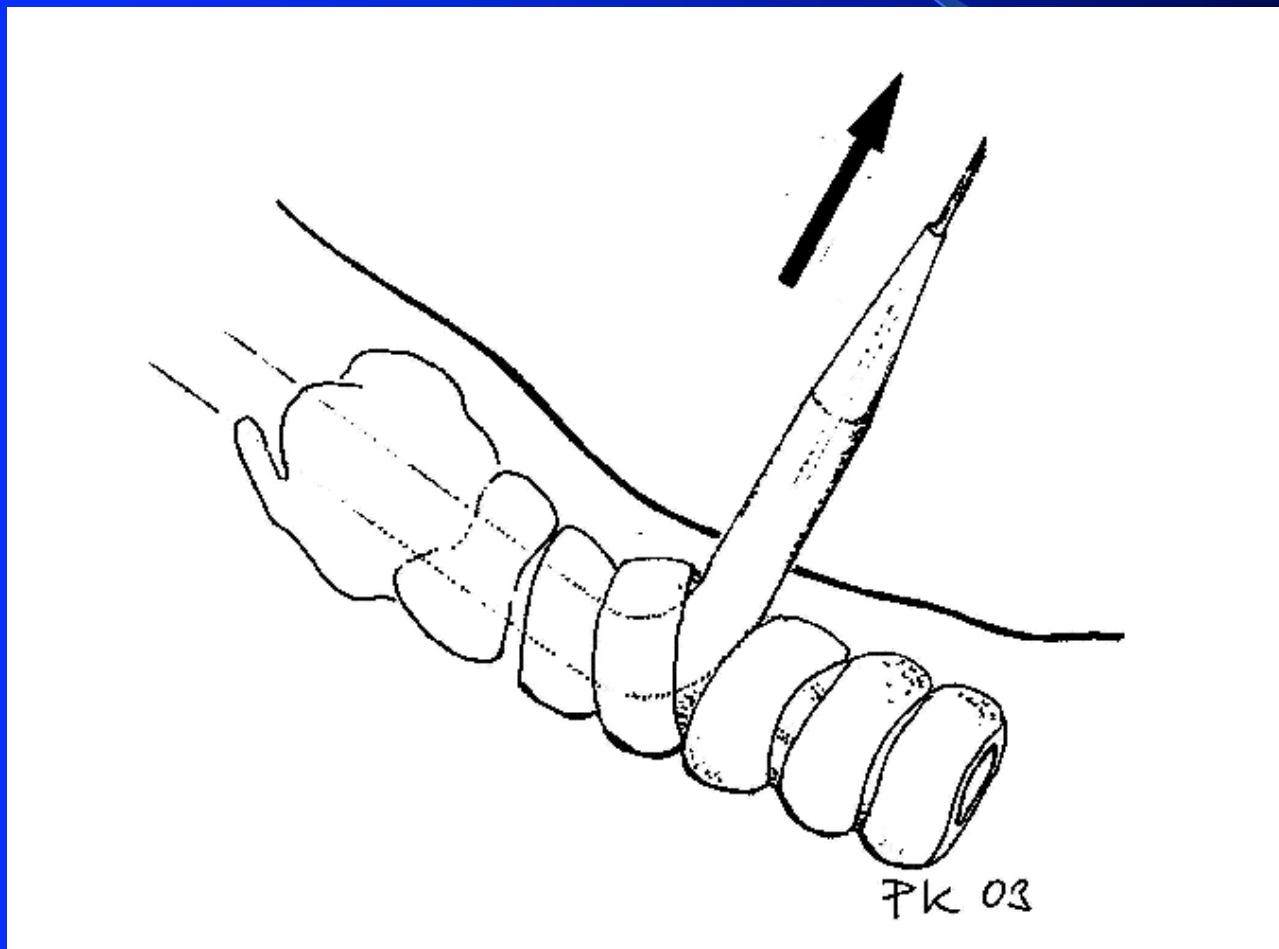

Punction, dilatation tracheotomy - Ciaglia (1985)

PDT – Griggs (1990)

Translaryngeal tracheotomy Fantoni (1993)

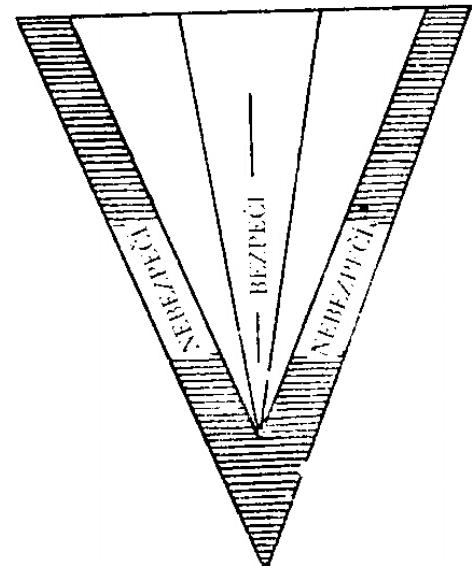

Complication in tracheotomy

During surgery bleeding,
dyspnoe, lost of orientation,

Early post surgery,
emphysema, embolism,
mediastinální emfyzém,
pneumothorax, inflammation
bleeding, nekoresponduje otvor
v průdušnici a na kůži-
problémy s výměnou kanyly .

Late post surgery stenosis

(C. CRICOID)

Orientační trojúhelník při
tracheotomii
(podle Ch. Jacksona):

Černá ramena trojúhelníku
značí nebezpečnou oblast svaz-
ku velkých krčních cév. Střed-
ní čára značí bezpečí jak před
krvácením, tak před funkční-
mi poruchami hrtanu. Směrem
kaudálním od chrupavky prs-
tencové, která tvoří základnu
trojúhelníku, bezpečí ubývá,
poněvadž se obě nebezpečné
zóny sbližují
