Ear I

**ENT Clinic of Masaryk University, Brno
Faculty St. Ann Hospital**
Head: Ass.prof. Gal Břetislav, MD, Ph.D.
Pekařská 53, Brno , 656 91

The hearing and balance system localized in temporal bone

Two main subdivisions:

Peripheral Part

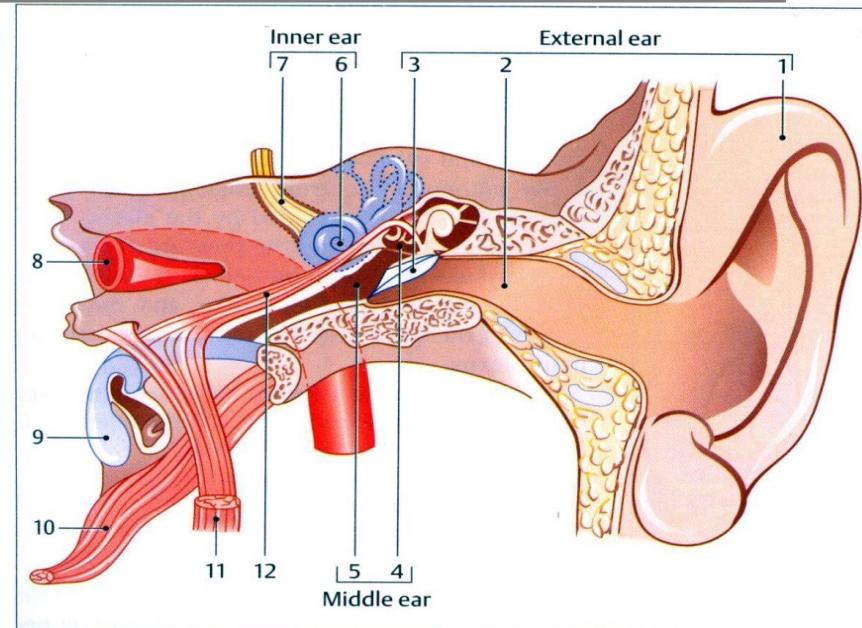

- external, middle and inner ear
- auditory nerve

Central Part

- central hearing pathways
- subcortical and cortical auditory centers
- central balance mechanism

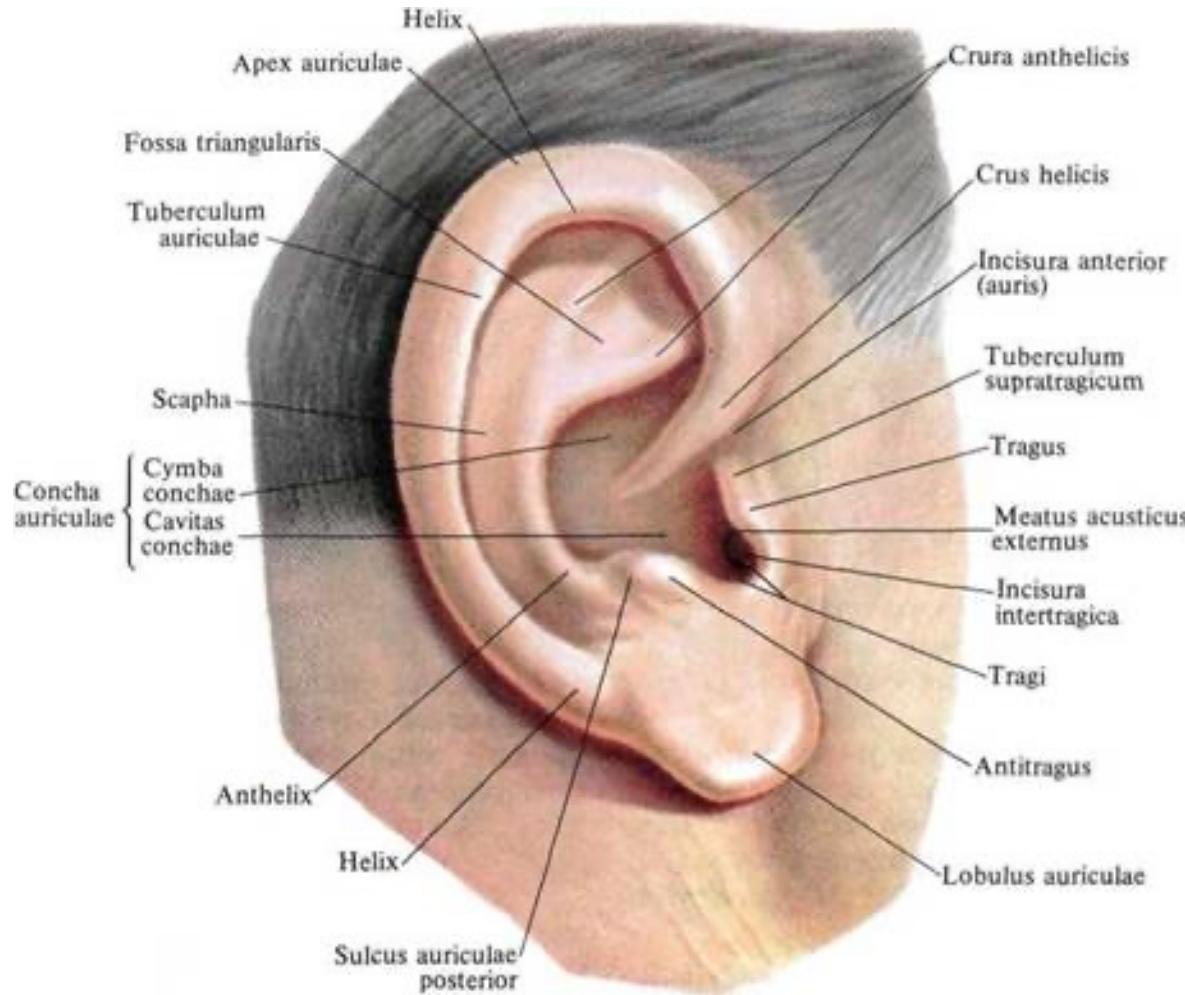

Anatomic boundary - entry the VIIth nerve into brainstem.

- The external and middle ear *transport* the stimulus
- cochlea *distributes* the stimulus
- the sensory cells *transform* the stimulus

External ear

Auricle – abundantly formatted cartilage

External meatus (meatus acusticus externus)

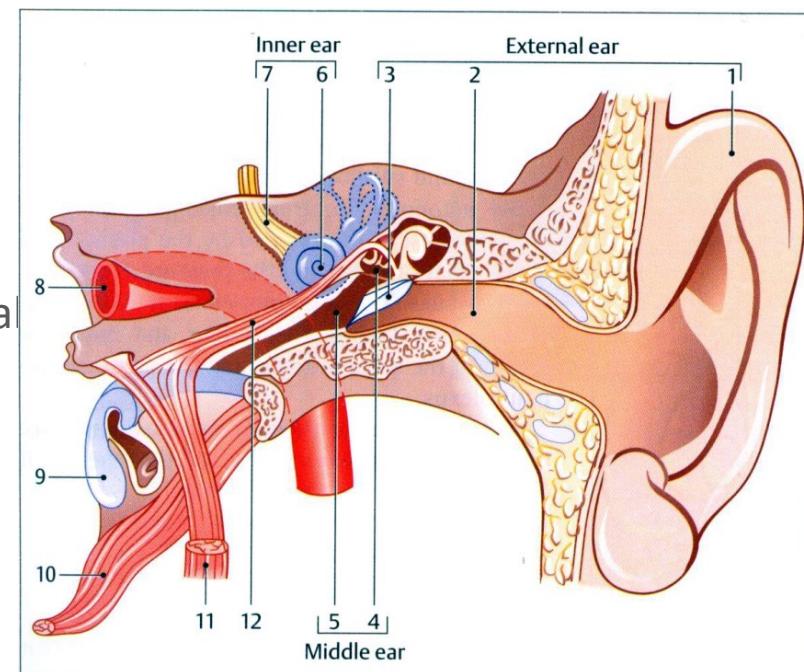

External part

- cartilage
- Lined with skin and down (tragi) and sebaceous gland – cerumen

Internal part

- Temporal bone
- Lined with thinned epidermis
- curved cartilaginous mobile part –
must be drawn upward and posteriorly –
to bring the same axis

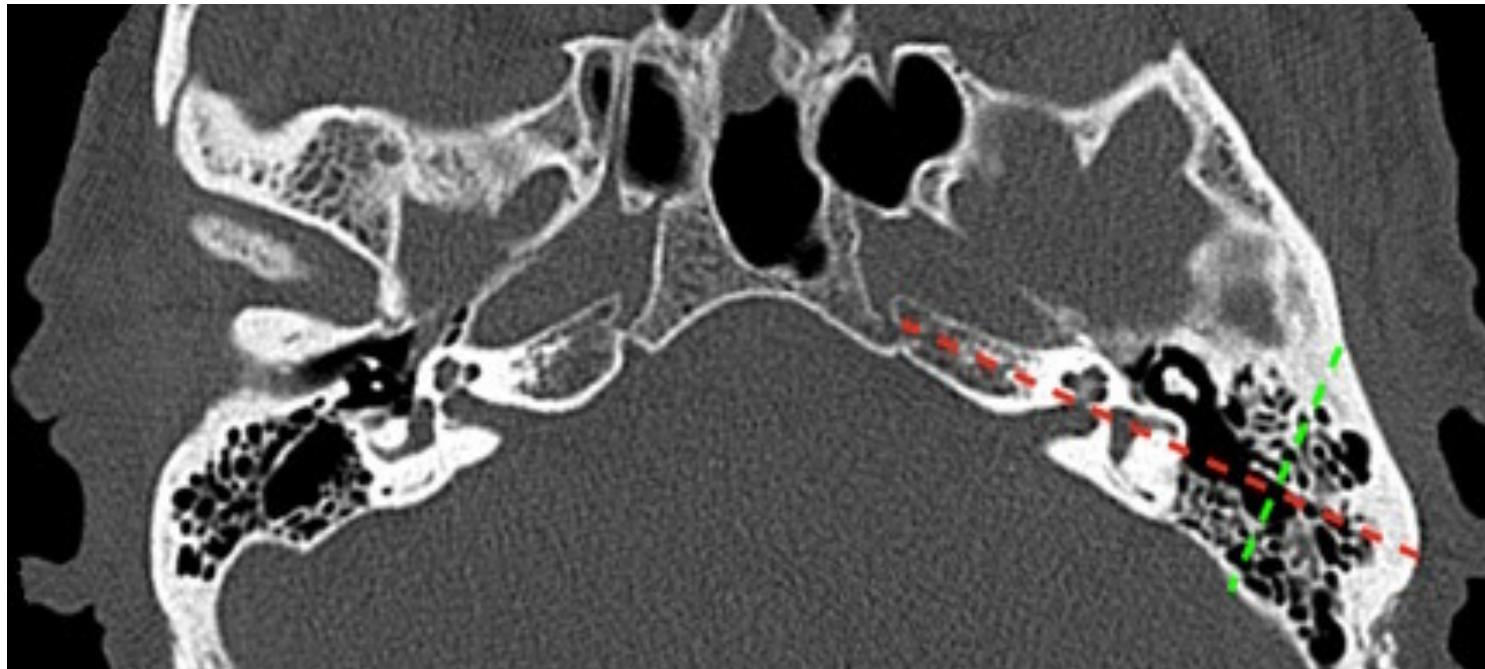

External meatus skin has 10x higher growth potential than middle ear lining – theory of development of acquired cholesteatoma

Middle Ear

Middle Ear cavity

- summary name for the whole pneumatic system of temporal bone:
tympanic cavity, cells of proc. mastoideus and Eustachian tube
(tubotympanal and tympanomastoideal segment)

Tympanic membrane (membrana tympani)

- a sound pressure receptor and transformer

Inclination and declination angle to meatus axis
surface 55 mm²

- sulcus tympanicus
- anulus fibrocartilagineus

pars tensa

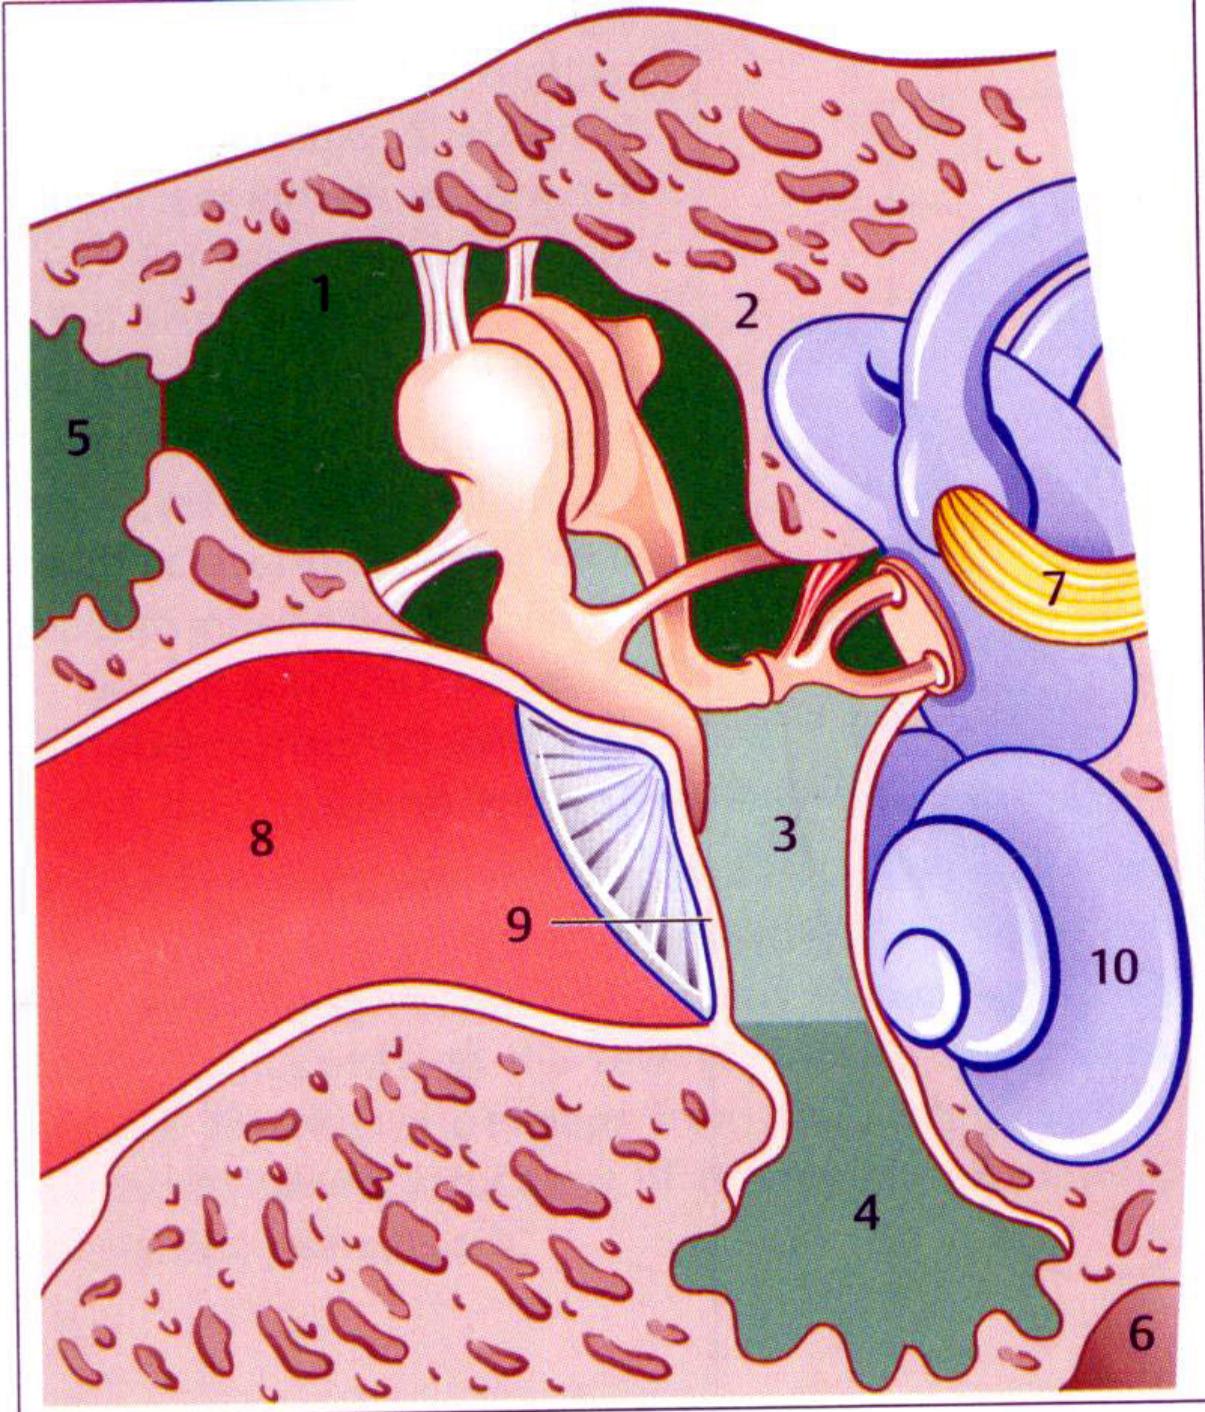

- *Three layers:*
 - external- epidermis (stratum cunateum)
 - middle- fibrouas layer ,str. fibrosum
 - internal- epitel, str. mucosum

pars flaccida (membrana Shrapnelli)

- Surface 5 mm² in superior part of ear drum
- Fibrous layer is missing

1,2 epitympanic recess
3 mesotympanum
4 hypotympanic recess

Cavum tympani - (shape of biconcave lens) 6 walls

Paries:

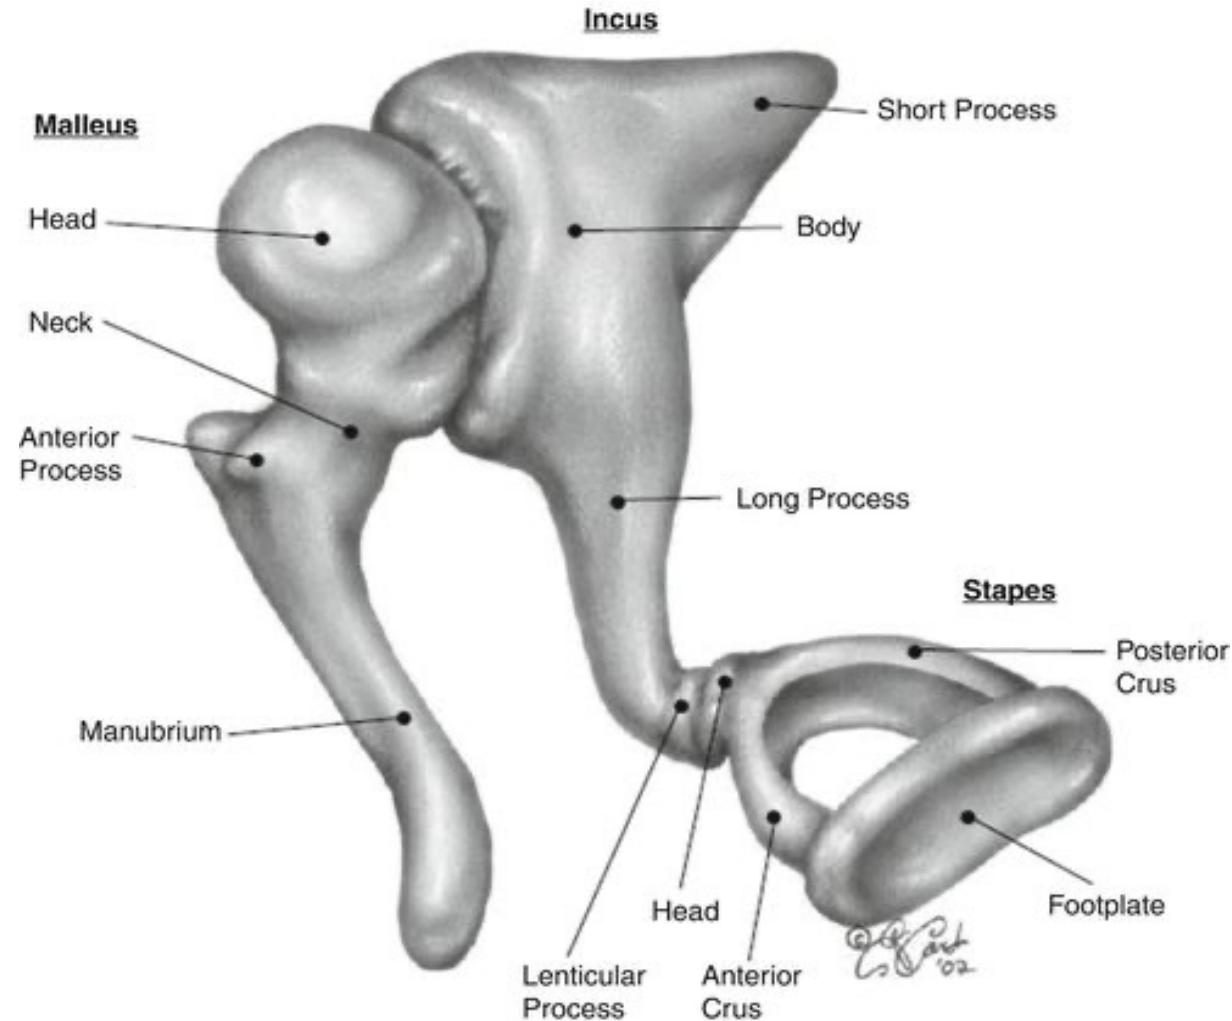

- membranaceus
- labyrinthicus
- tegmentalnis
- jugularis
- mastoidea
- caroticus

Middle ear

Tympanic cavity (cavum tympani)

ossicular chain:

- *malleus*
- *incus*
- *stapes*)

HEARING FUNCTION (TRANSFER, SYSTEM)

1. Compensation of loss of acoustic energy (ear- liquid):
 - a/ tympanic membrane - oval window 14x
 - b/ lever-action system of ossicles 1,3x
 - c/ lever-action system due to uneven incurvation of ear drum,
all together 30-35dB
2. Mutual change of deviation and pressure acoustic vibration .
Gas = great deviation, low pressure.
Liquid = low deviation, great pressure .

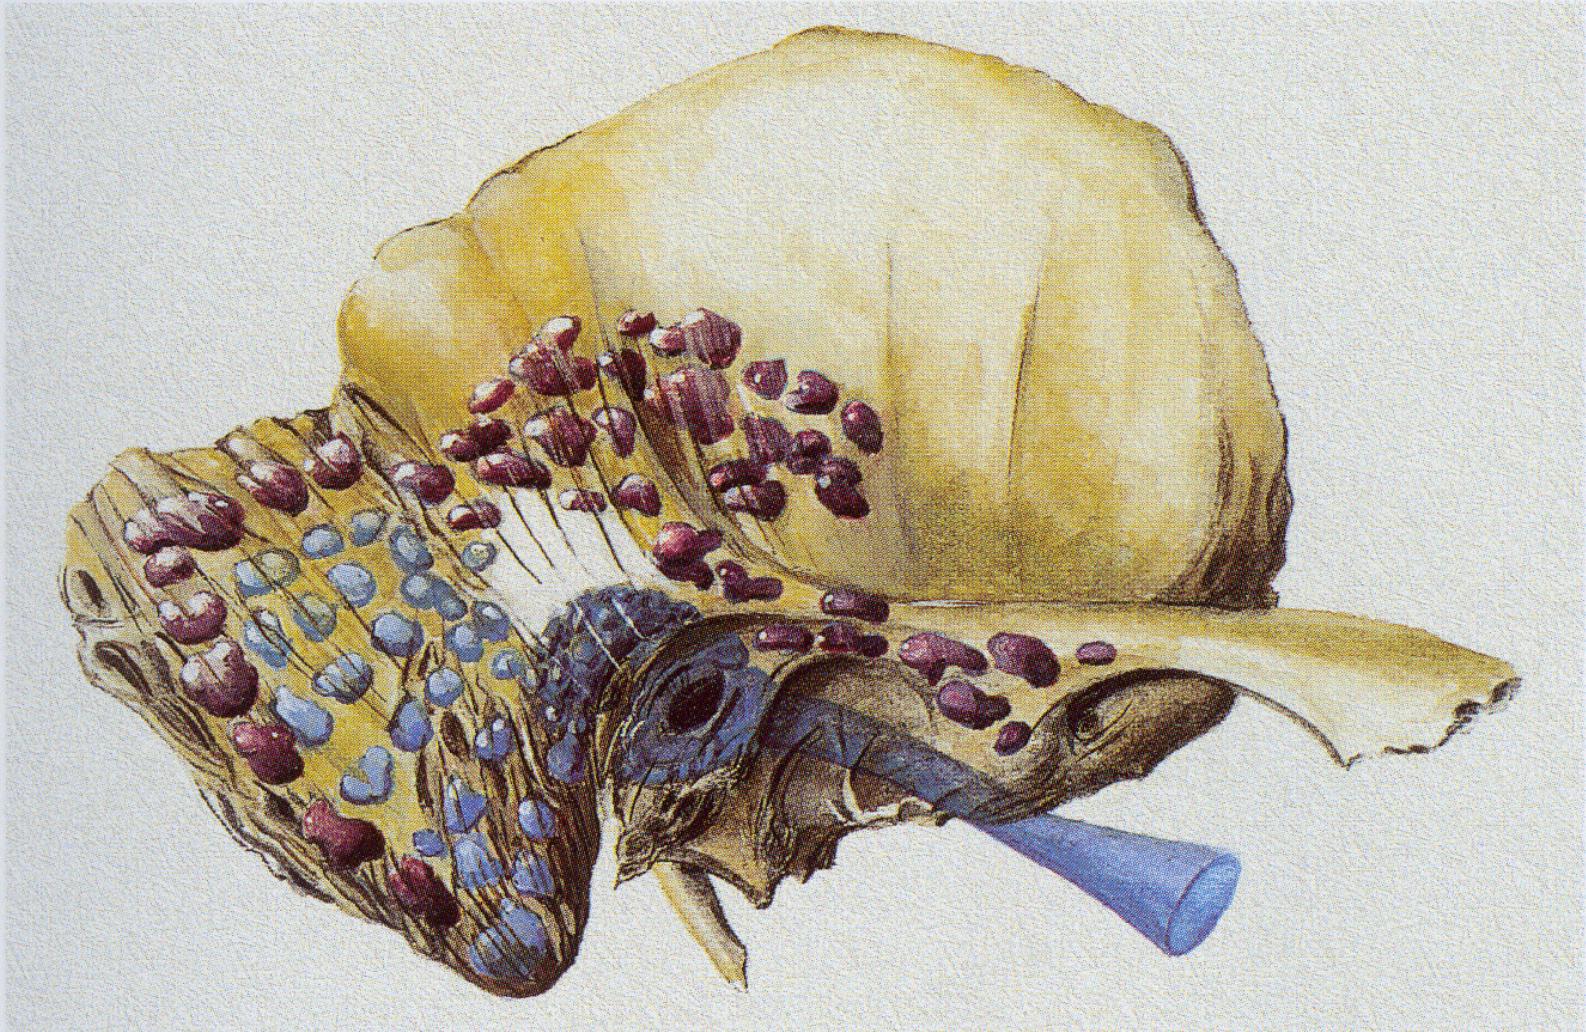

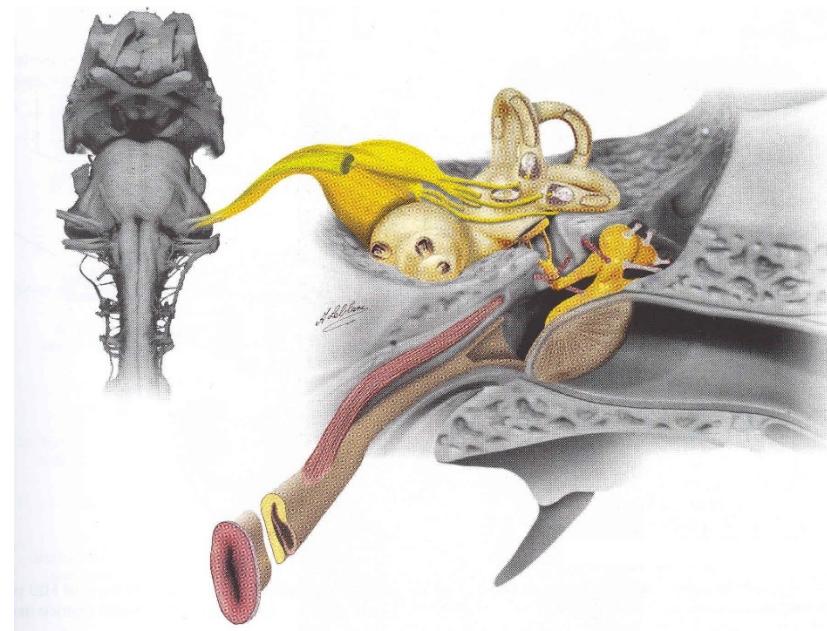

Fig. 26

Pneumatization types of the petrous bone

- compact mastoid process
- restrained pneumatization
- good pneumatization

Eustachian tube

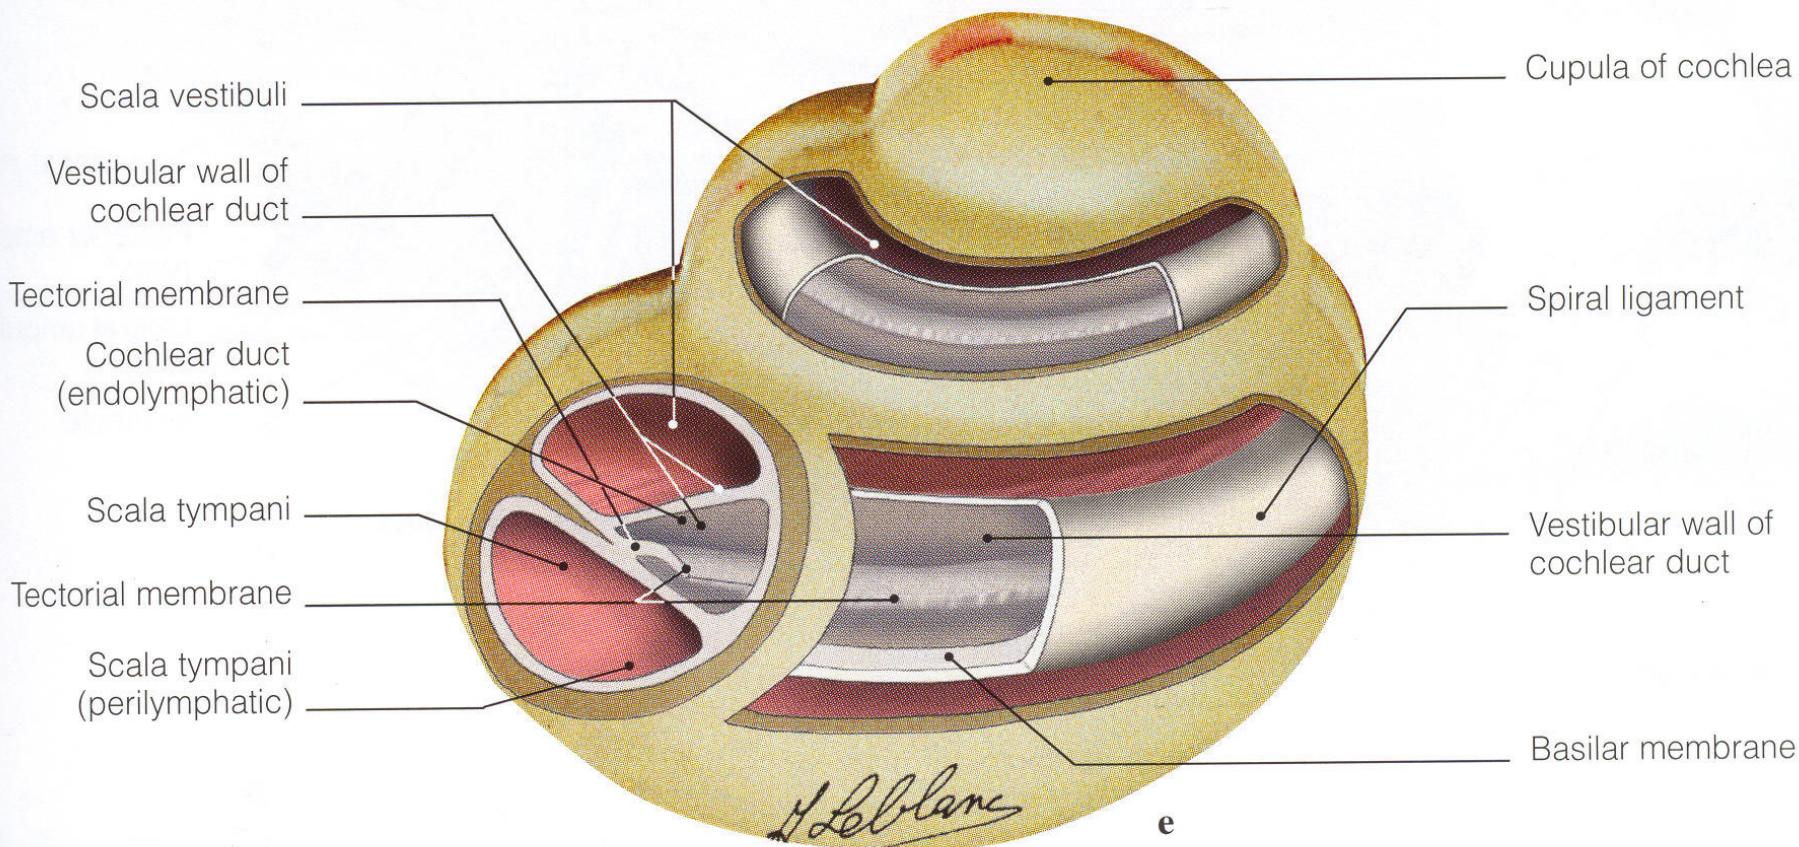

- **Ventilation function** - it serves to equalize the pressure between middle ear and the nasopharynx
- **Drainage function** – removal of secretion from middle ear cavity
- **Protective function** - before secretion penetration into middle ear cavity

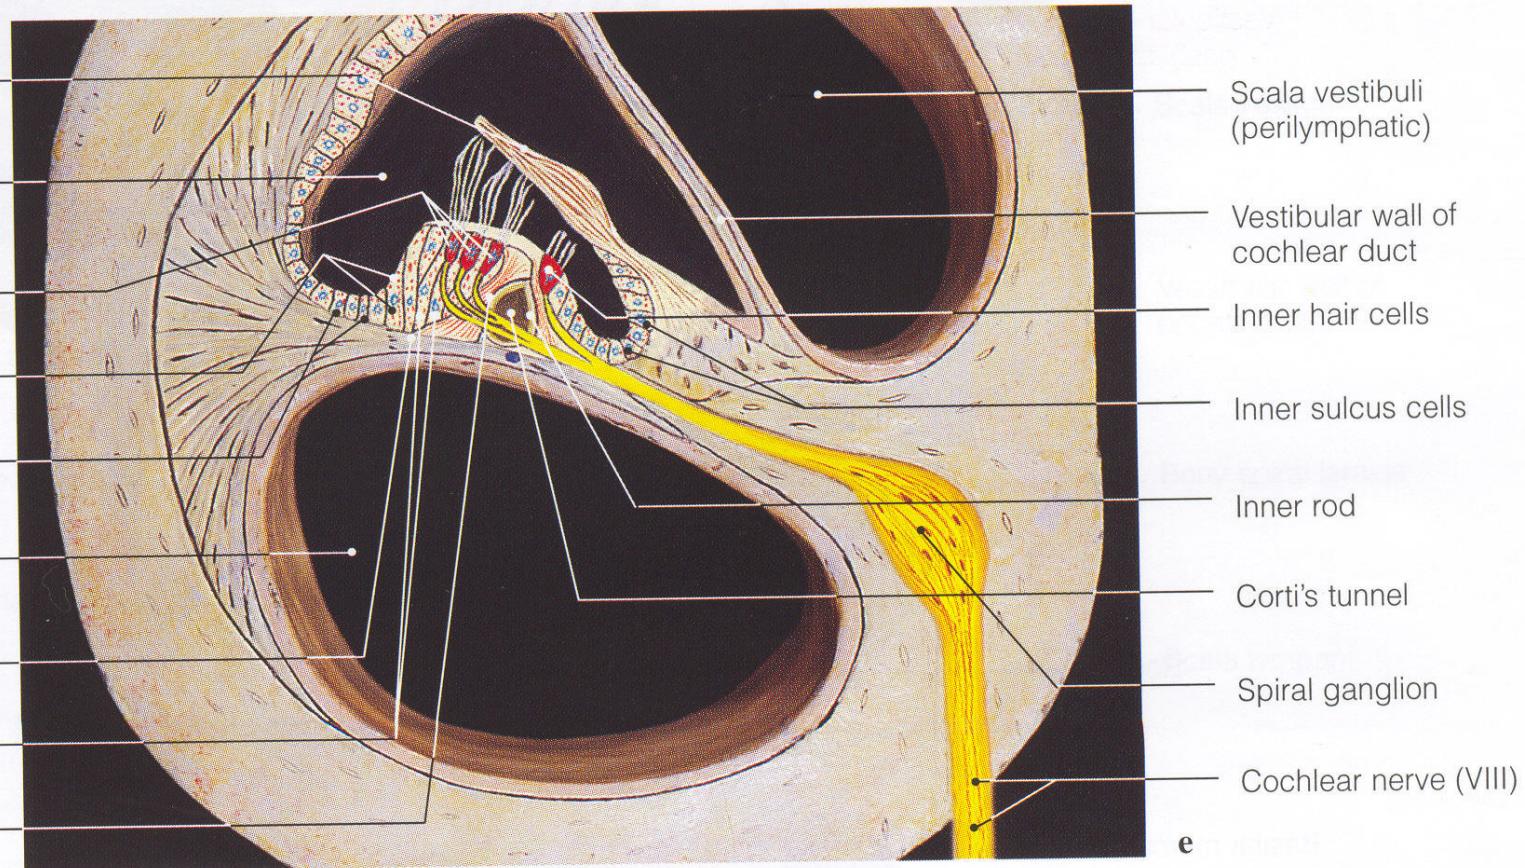

Cochlear function:

- Change of mechanic vibration on neural excitation
- Basic frequency analysis

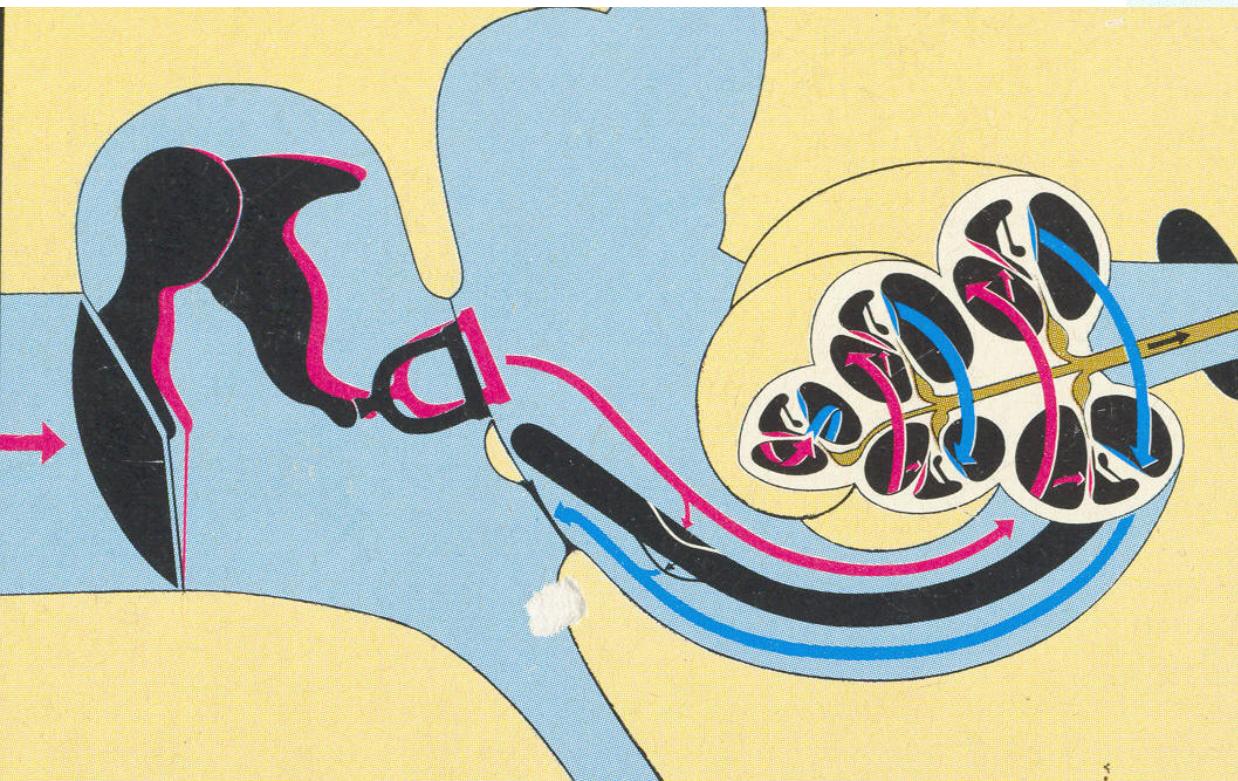

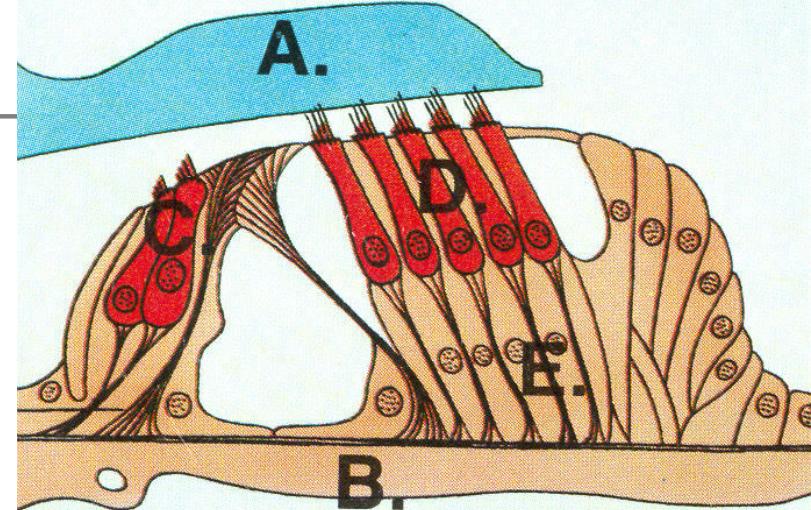

Cochlear cross-section

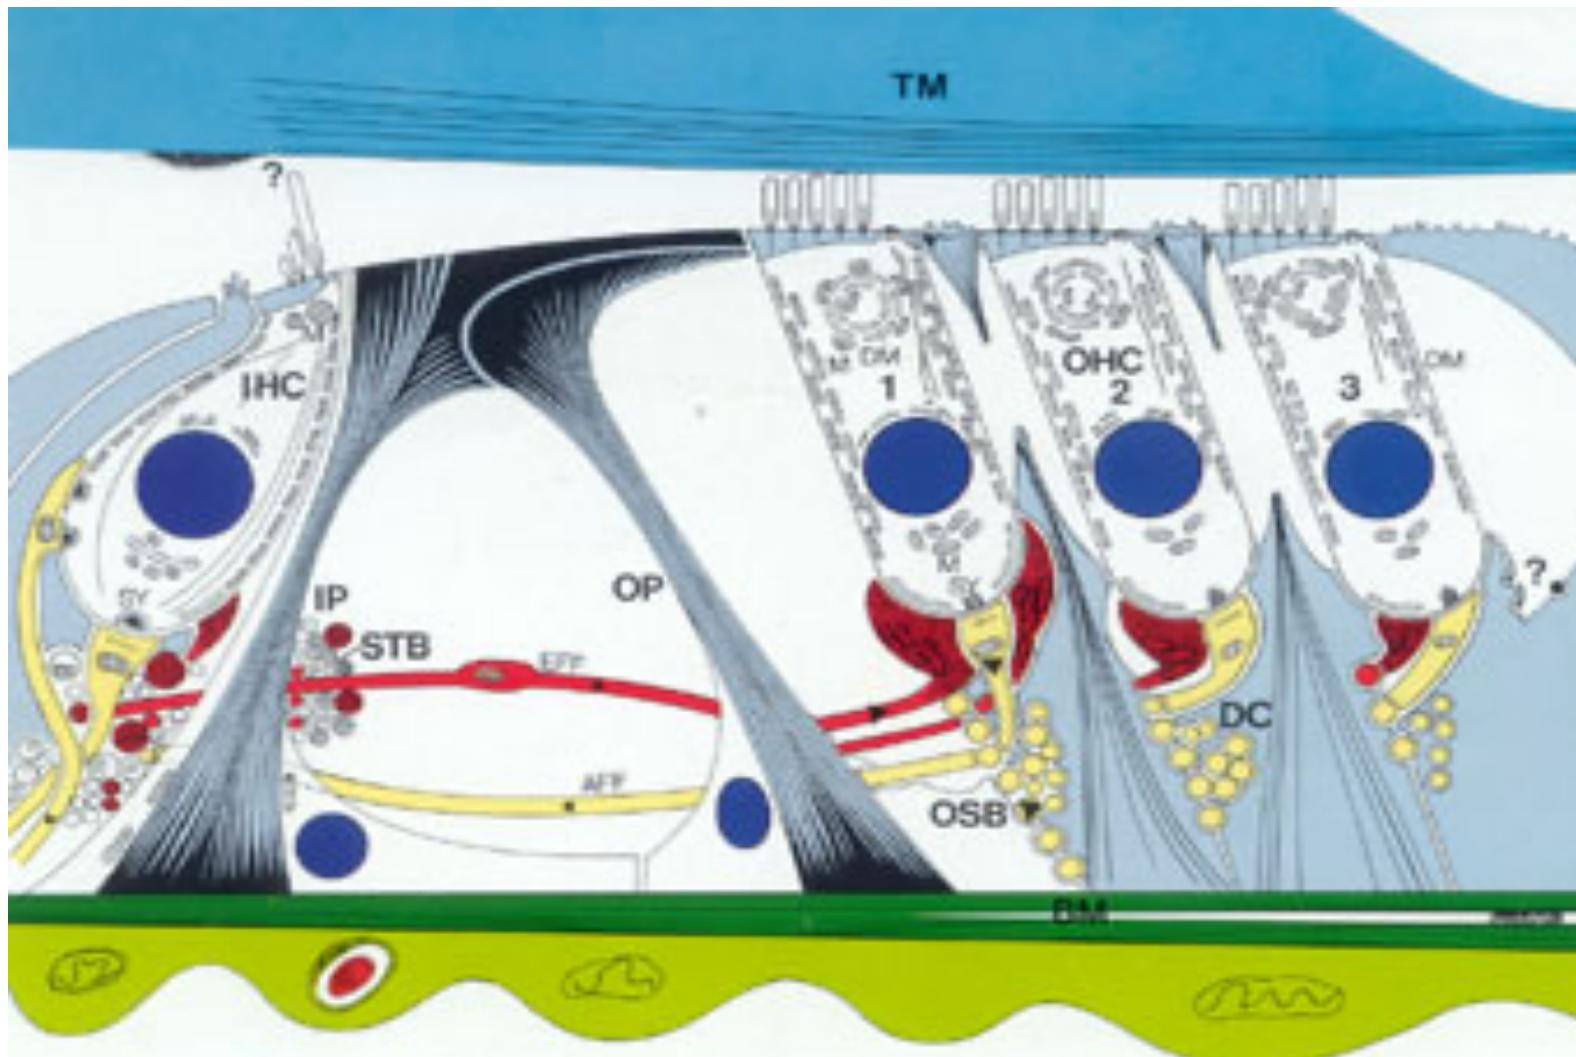

Cochlear duct cross-section

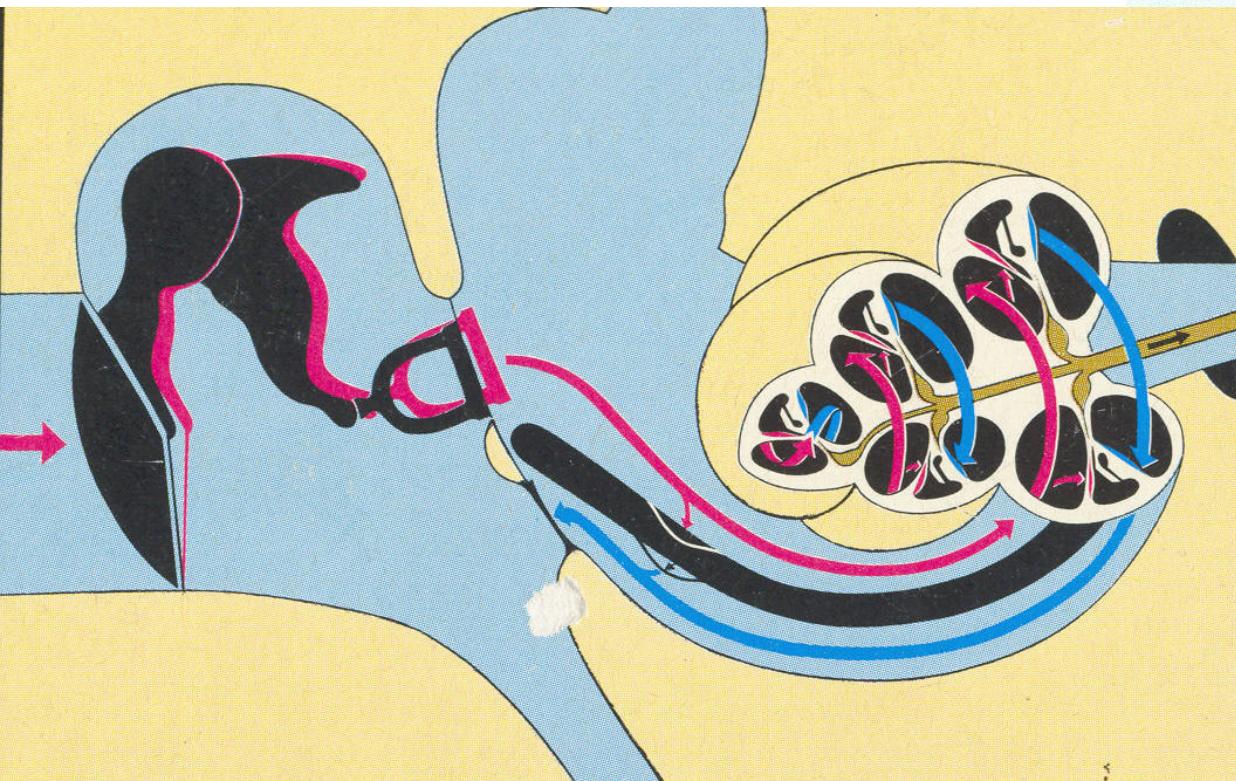

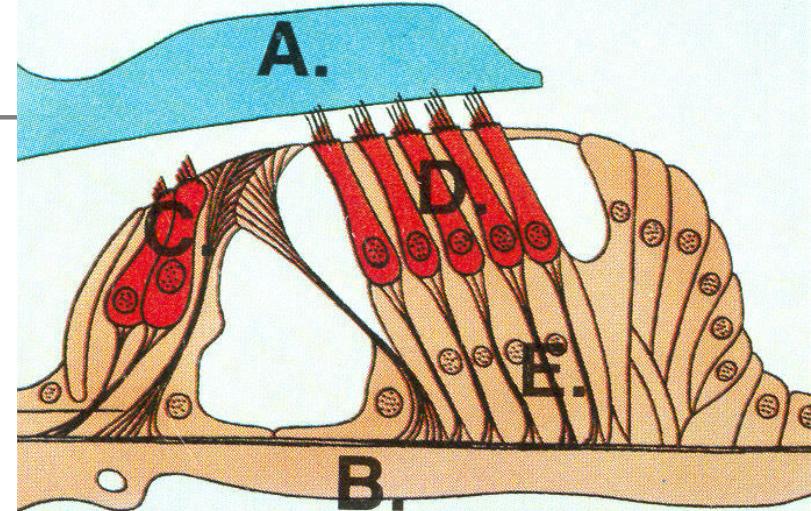

Conduction of vibration from tymp. membr. through cochlea, Organon Corti

Outer hair cells (OHC) = servomechanism for inner hair cells (IHC)

routing vibration from ear drum through cochlea, Organon Corti

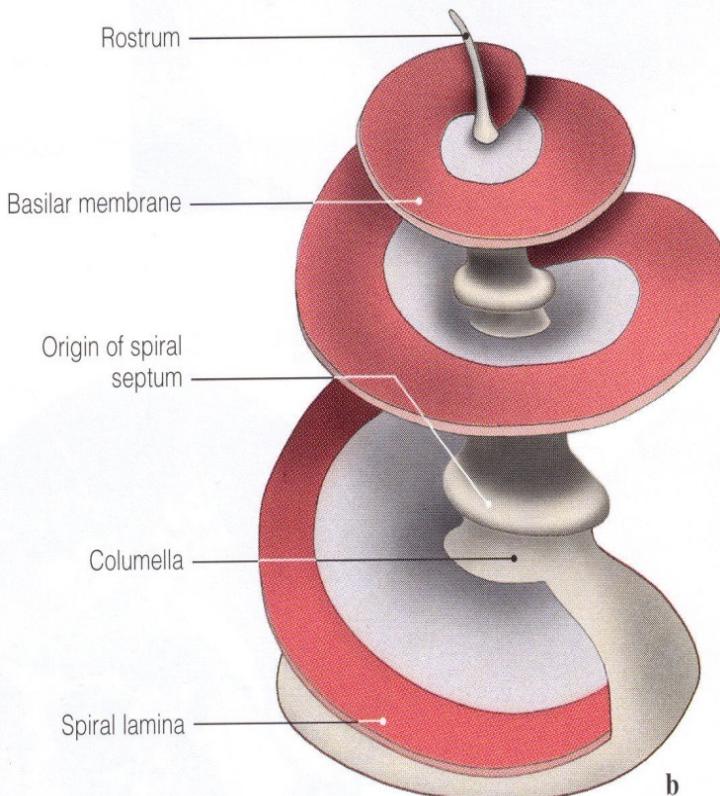

Cochlear septum

System of 3 membranes –
membrana basilaris, reticularis,
tectoria

Principle of tonotopy

– as higher frequency, the acoustic pressure balanced near to stapes.
High frequency are perceived in basal whorl, low frequencies in apical whorl.

Wave hydrodynamic theory of hearing (von Bekesy theory of „traveling wave“)

- Acoustic tension is led from ear drum through ossicles into oval window.
- Liquid is not compressible, pressure changes are equalized on round window membrane, which vibrate in anti phase to stapes.
- Acoustic pressure is equalized on cochlear septum and it creates a wave.
- A sound impulse sends a wave sweeping along the basilar membrane. ... And as Helmholtz had postulated, **Bekesy** found that the high-frequency tones were perceived near the base of the cochlea and the lower frequencies toward the apex." **(principle of tonotopy).**
- „traveling wave“ leads to shift of tectorial membrane of Organon Corti in relation to basilar membrane and deflection of hairs of sensory cells
- Thus the mechanic energy is changed into electric potential in VIII cranial nerve.

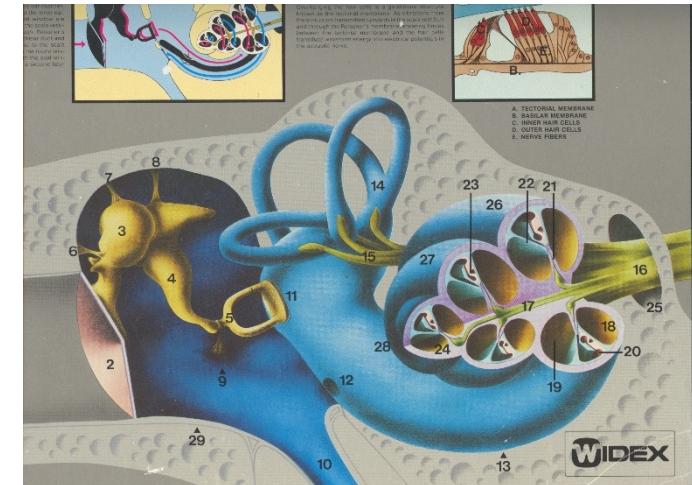

Vestibular system

Basic function

- Equilibrium of human body in stand and in walking
- Stabilization of retinal picture and keeping visual sharpness in movement

Basic reflex circles

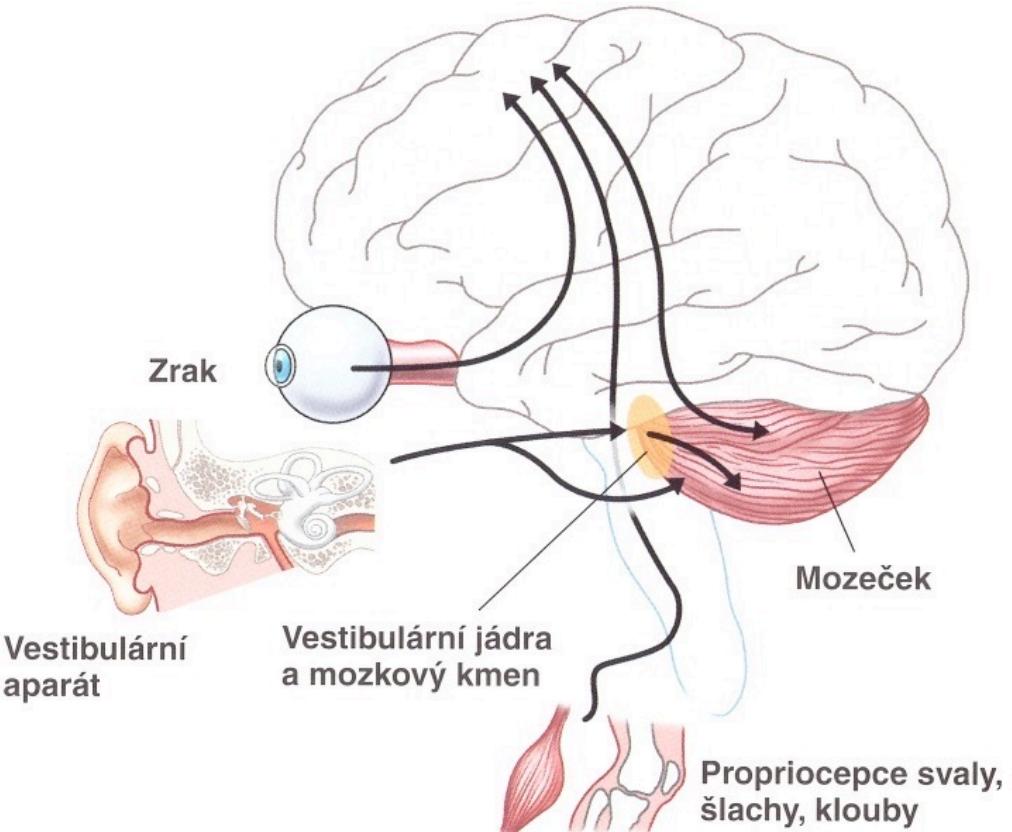

- vestibulo-ocular reflex (VOR)
- Vestibulo-spinal reflex (VSR) - help keep head and body in upright position due to vestibulospinal system.

Equilibrium

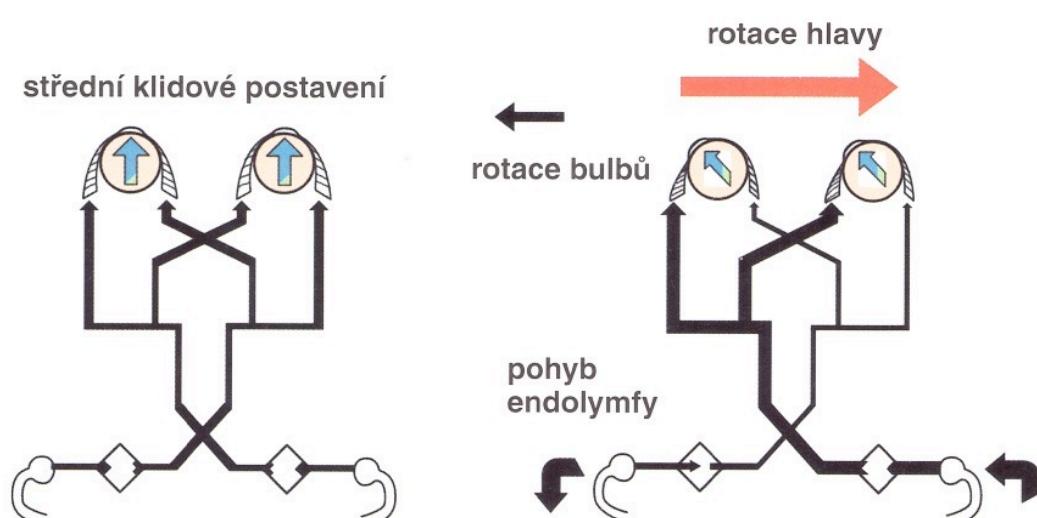

Interaction of eye, vestibular-semicircular system, proprioception and cerebellum on keeping balance

Three afferent sources
of equilibrium: eye,
proprioception and
vestibular system.

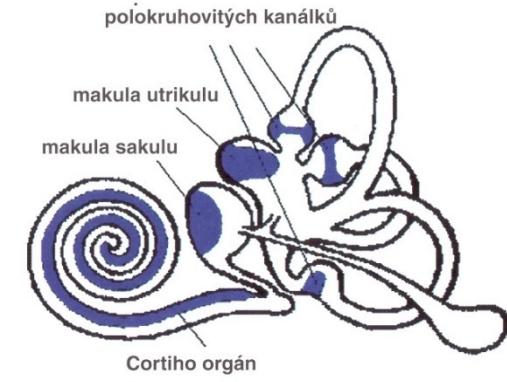

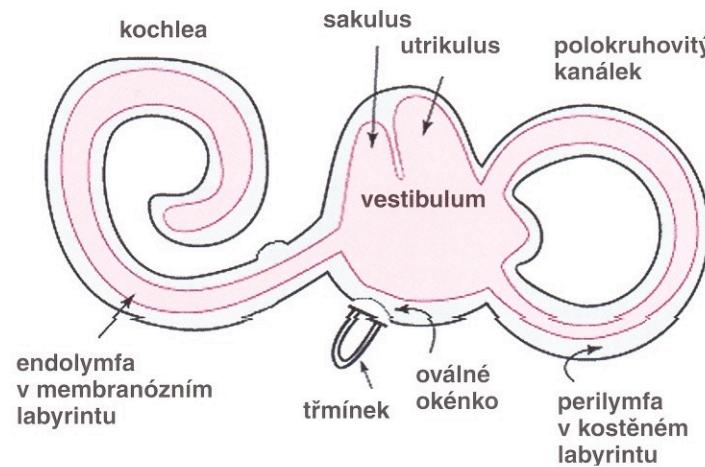

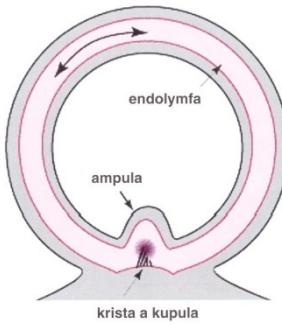

Vestibulo-ocular reflex

Create movement of eye, which are opposite to movement of head in some plains. Nystagmus – conjugated, coordinated eye movement around a specific axis. **The movement consists of rhythmically alternating slow – and fast beating phases.** The direction of the fast components determines the laterality of the nystagmus.

Membranous labyrinth

- Vestibular apparatus localized in pyramis ossis temporalis; membranous labyrinth: saccule, utricle and three semicircular canal; filled with endolymph.
- Every semicircular canal begins with pars **ampullaris with ampillary crest**, sense organ is **static macula**.

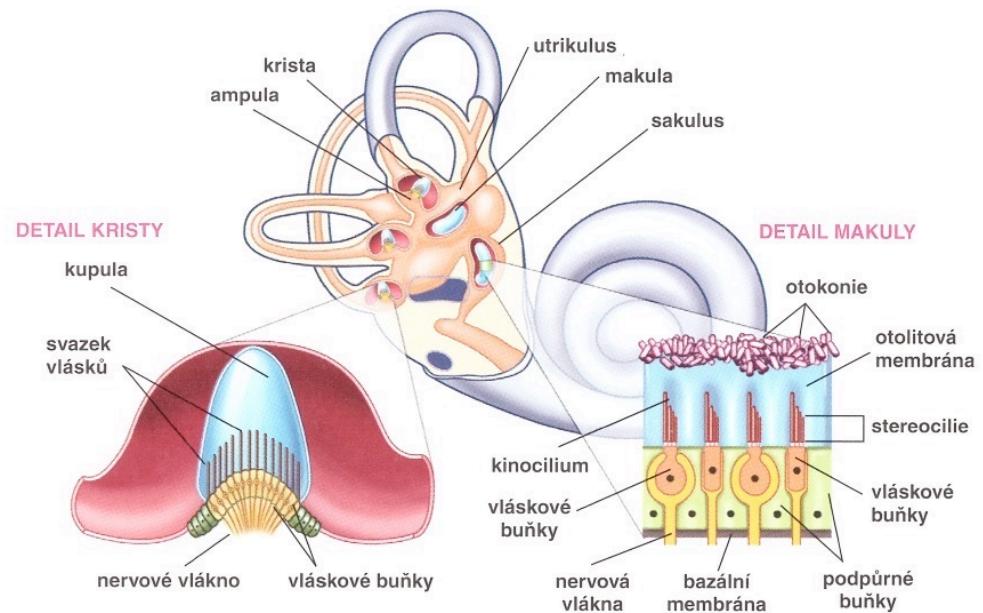

Section of semicircular canal, schema of membranous labyrinth (with one canal), sensory organs.

Genesis of receptor potential

Ampullary crests and **maculae utricle and saccule** are created **supporting cells and hair cells**. On their surface lie the **otoliths** (statoconia) – calcium carbonate crystal.

Linear acceleration changes the otolith pressure, **deflecting the sensory hairs**. This stimulates the sensory cell by altering the resting **potential**.

Vestibular function Tests

- History – subjective feeling of dizziness
- Nystagmus
- Vestibule-spinal and cerebellar reflexes:
 - Hautant test (spontaneous deviation test),
 - Romberg test,
 - Barany test (finger-nose pointing test) ; posturography
- Head impulse test: from mild eccentric head position we provide passive quick rotation movement from side to side.

Vestibular function Tests

- Head shaking nystagmus – spontaneous Ny can be provoked by gentle, passive, horizontal shaking of the patients head
- Detail evaluation of eye movement - electronystagmography, video oculography
- Unterberger test, walk „on the rope“
- Stabilometric plain - static and dynamic

Vertigo (dizziness)

- ***Periferal type*** – feeling of rotation of itself body or surroundings, direction of rotation is usually into healthy part, loss of stability or feeling of swimming
- ***Central type*** – ineptitude by walk, inability of walk, vertigines with aura (EPI), disorder of vision "*black outs*" – diplopia is seen by disorder of oculomotory.

Symptom	Peripheral (harmonic) VS	Central VS
Nystagmus	Horizontal rotatory on side of most reactive labyrinth	Other then Horizontal rotatory (only horizontal, vertical, „gaze“ nystagmus, rebound nystagmus etc)
Tonic deviation	On side of weak labyrinth (to affected ear) in relation to position of head	Without relation to head position
Eye fixation	In absence of eye fixation nystagmus is growing	In absence of eye fixation nystagmus not changed
Cranial nerves	Without lesion (excl.: n. VII)	Lesion of cranial nerves present
Cerebellar symptoms	Not present	Could be present
Disturbance of oculomotoric function	Not present	Could be present
Hearing disorder	Usually Could be present	Usually Not present
Central compensation	Gradually compensation, harmonic symptoms: intensity of vertigo correlates with nystagmus intensity and tonic deviations	Not present, disharmonic symptoms

History of ear disease

Physician itself is a „remedy“. (Michael Balint)

Hearing
disorder

Otorhoea
Ear discharge

Tinnitus

Pain

Dizzines

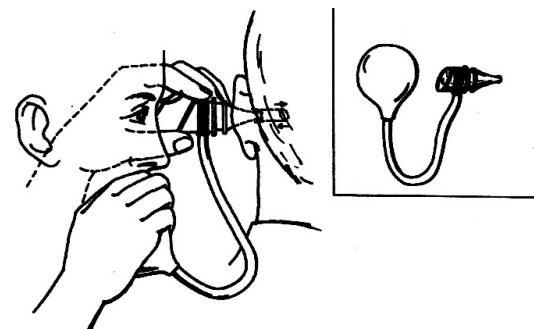

■ Aspect and palpation

- Auricle shape, deformities
- Skin lesions, scars (also retroauriculars)
- Discharge from external meatus
- Pain in pressure on tragus (by otitis externa)
- Pain in pressure on processus mastoideus (by mastoiditis acuta)

■ Otoscopy and oto(mikro)scopy evaluation

- Ear speculum
- Illuminated otoscope, pneumo-otoscopy
- otomicroscope

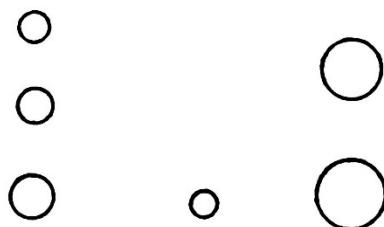

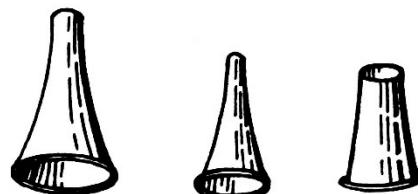

Obr. 13: Zavádění ušního zrcátka u dítěte

Obr. 12: Zavádění ušního zrcátka u dospělého

Obr. 11: Ušní zrcátka

Otoscopy
eye evaluation of
deeper parts of
external meatus
and ear drum

Bezold's trias

- Prominentia mallearis
- Stria mallearis
- Light reflex

Otoscopy – tympanic membrane quadrants and zones

p - prominens malleolus

a - atra malleolus

zh - umbra

p - reflexus reflex

Kvadranty:

p - posterior

ph - " horner

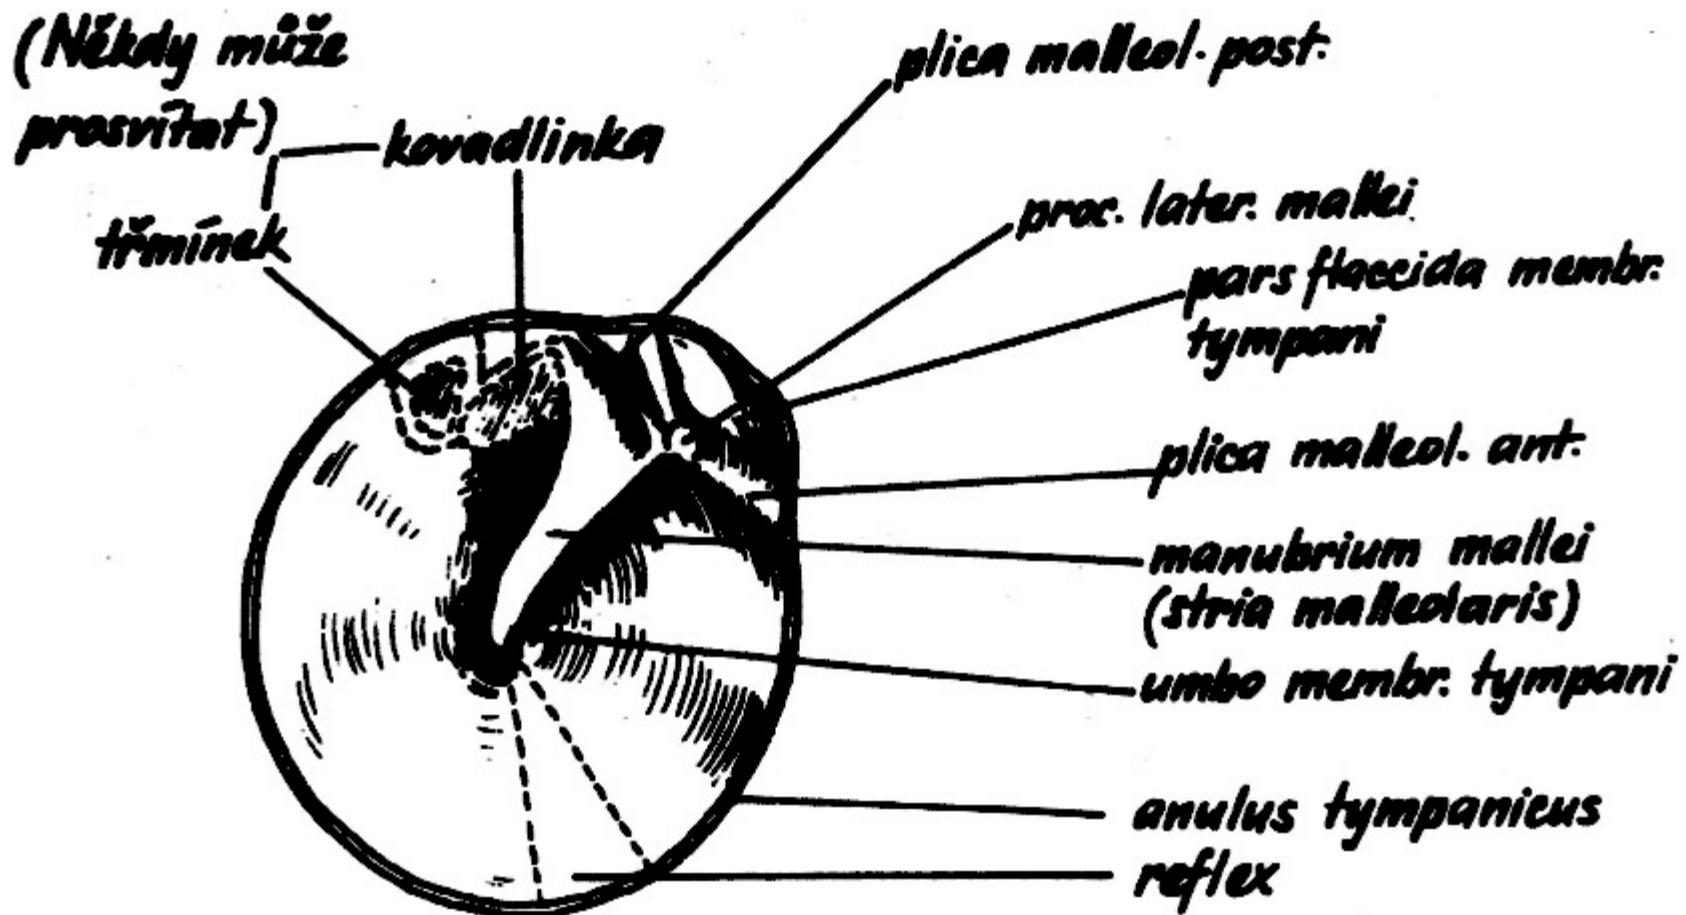

zh - anterior

ph - " horner

zóny: c - centrum; i - intermediálne; p - perifórum

Rozdelení bubínského povrchu na kvadranty a zóny

Normal ear drum

Basic pathologic finding on tympanic membrane

- Injection of the vessels of the tympanic membrane
- **(position) bulging due to exudate** - hyperemia, moist infiltration and opacity of the surface, the contours of the handle of malleus and short process disappear
- **retraction** - injection of blood vessels
- **(integrity) perforations** –
 - after injury
 - inflammatory - acute
 - chronic - central (mesotympanic)
 - - marginal (peripheral)
- **(changes after inflamm.) thickening of the tympanic membrane, scars**
- changes **behind** the ear-drum: middle ear effusion, fluid level, air bubbles

Various types of ear drum perforations

Centrální perforace

ruptura bubínku

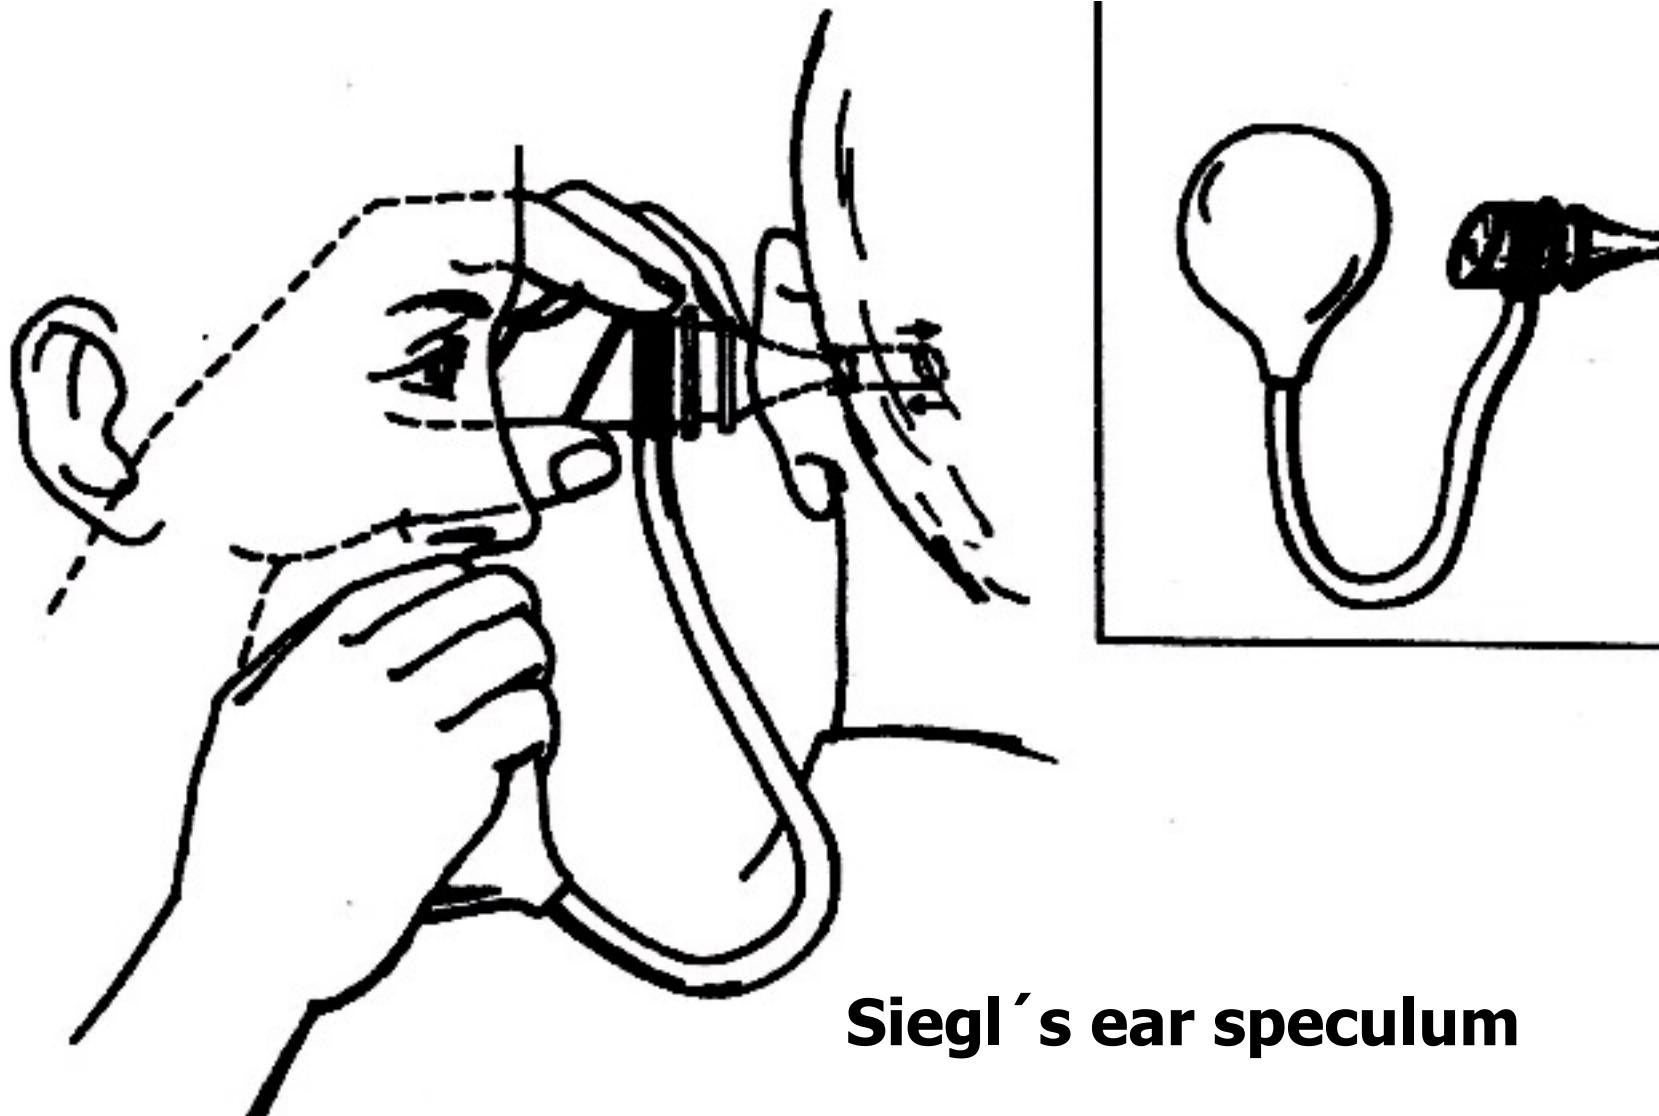

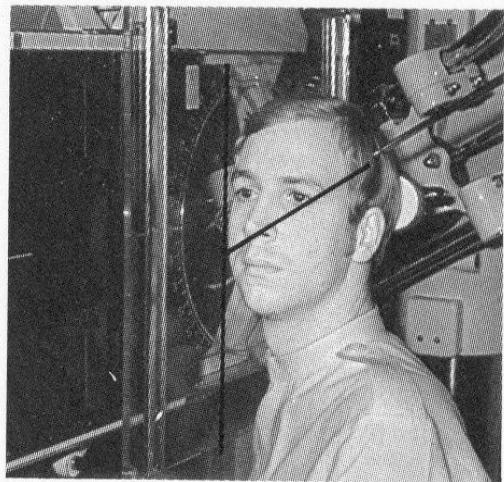

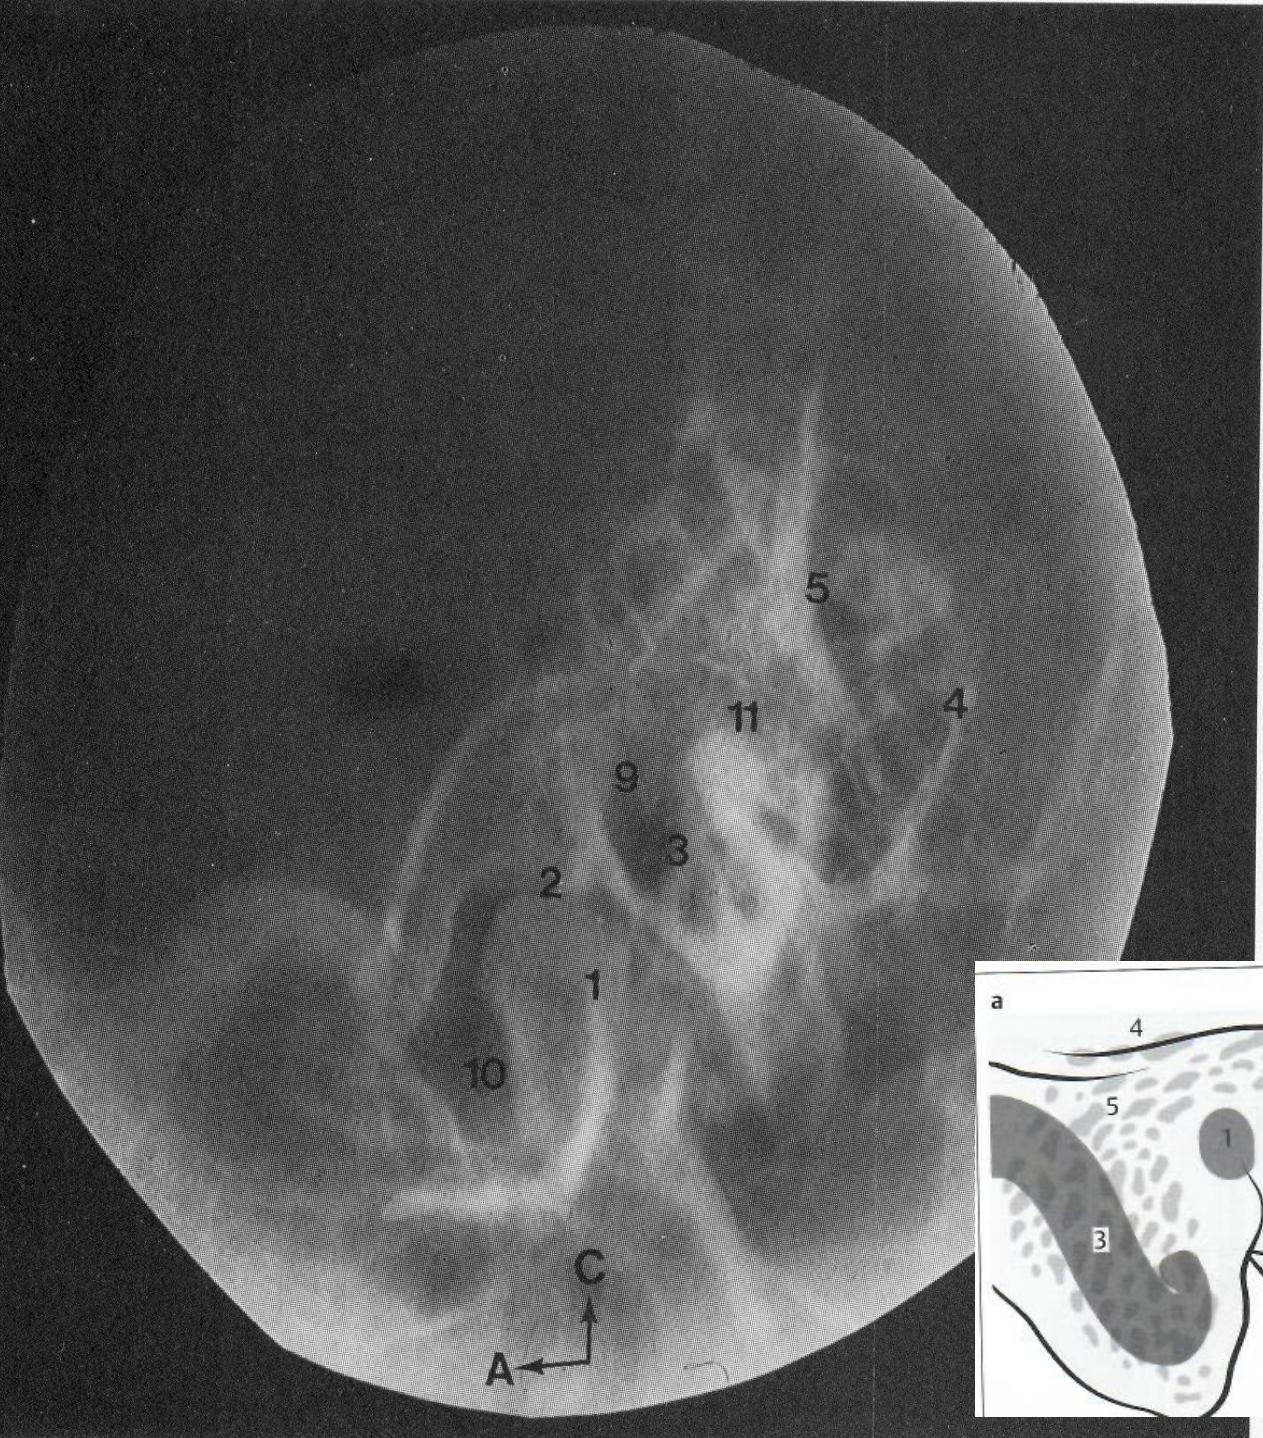

okrajové perforace

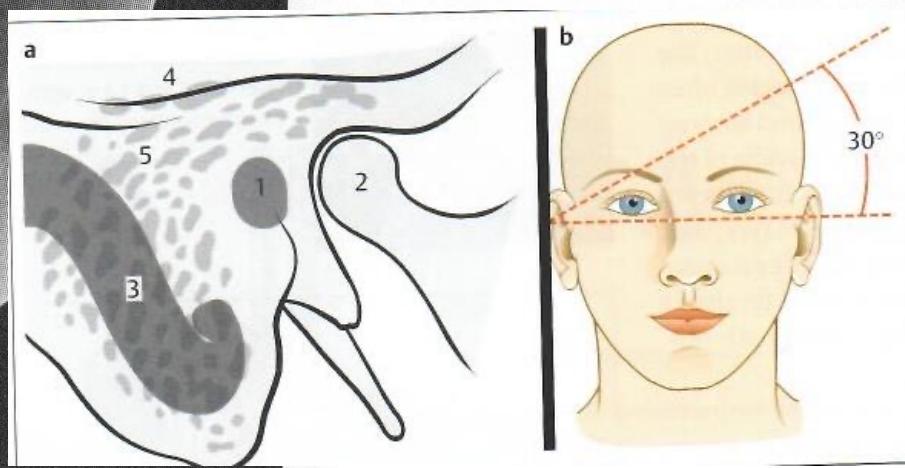

okrajová a centrální perforace

Siegl's ear speculum

Hearing disorder according to place of lesion

Schema of hearing organ:

- External ear – conductive hearing loss
- Inner ear sensorineural intracochlear hearing disorder
- Central pathways – retro cochlear hearing disorder

Hearing disorder (Hypacusis)

Senzorineural
Hypacusis perceptiva
Weber lat. to better hearing
Rinne posit
Schwabach shortened

Conductive hearing disorder
Hypacusis conductiva
Weber lat to worse hearing
Rinne negat
Schwabach prolonged

Mixed hearing disorder
Hypacusis mixta
Schwabach shortened
Rinne negat

Cochlear

Retro (supra) cochlear

Classification of basic type of hearing dysfunction
according to place of lesion

Evaluation of hearing function

We evaluate on growing level of objectivity:

- „Classical“ hearing test
- Audiometry
- Objective evaluating methods
 - tympanometry
 - evoked potentials
 - otoacoustic emissions

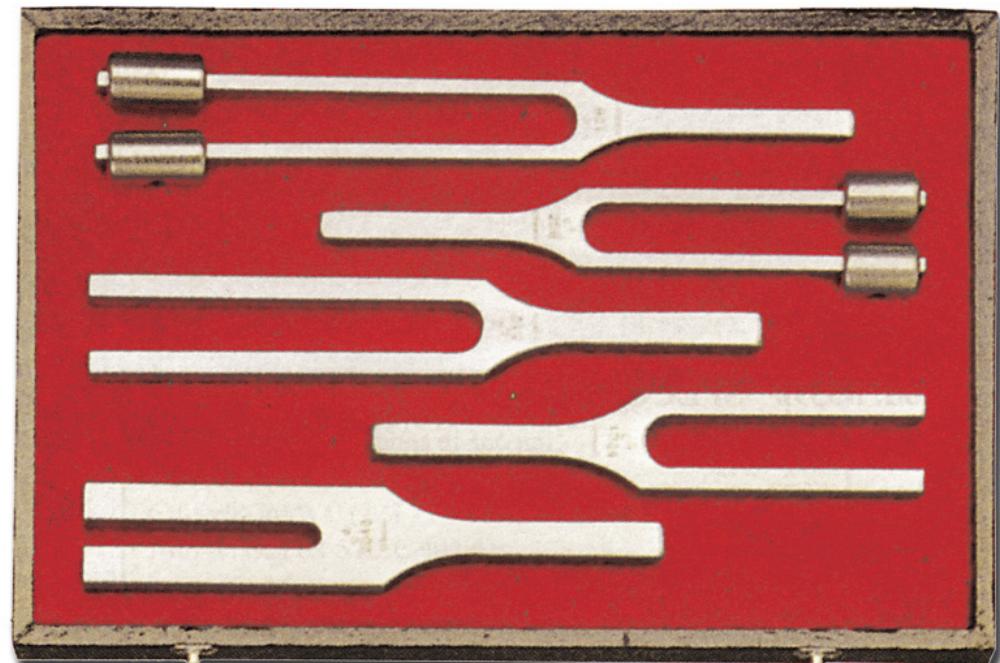

Classical hearing test

Important part of hearing tests:

- + quick, easy, cheap, information about understanding speech
- only for orientation

Tuning fork tests:

- Rinne
- Weber
- Schwabach,
Gellé, ...

Basic types of hearing disorder

Pure-tone audiometry

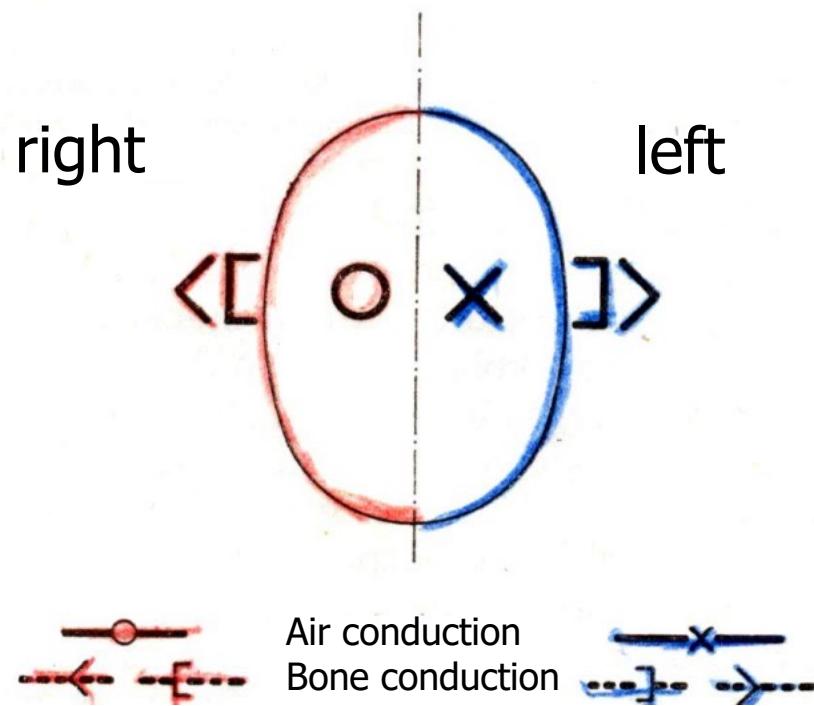

An Audiometer is an electric tone generator used to determine the **hearing threshold** for pure tones; generates tones of specific frequency (Hz) and intensity (dB).

- audiometric room
- Air conduction:
 - headphones
- Bone conduction:
 - bone vibrator

Normal range – until 20 dB loss

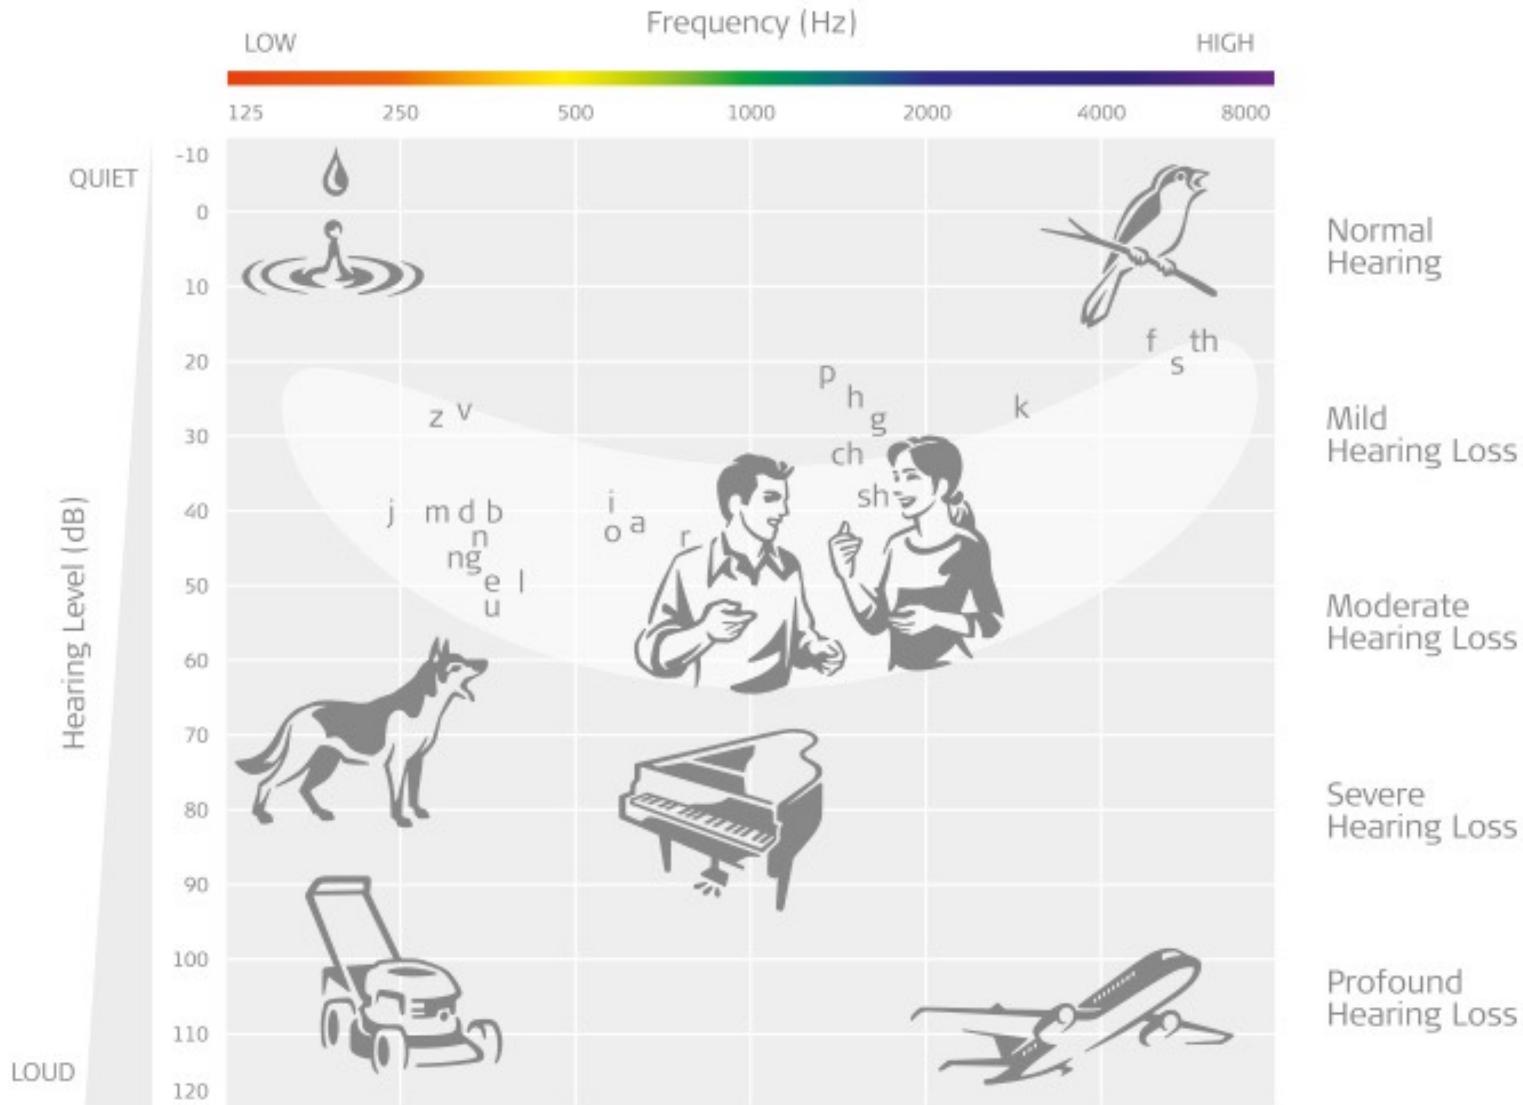

Symbols for record of audiometric evaluation

The speech field

Region of the best sensitivity for hearing

Speech audiometry

Patient repeats words which are reproduced. One correctly repeated word means 10% of comprehension from one set. It is evaluated on increasing levels of intensity till 100% of comprehension or maximally possible per cent of comprehension .

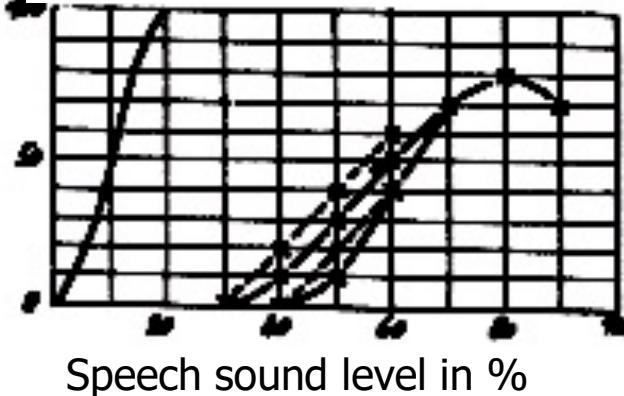

Normal hearing

Conductive hearing loss

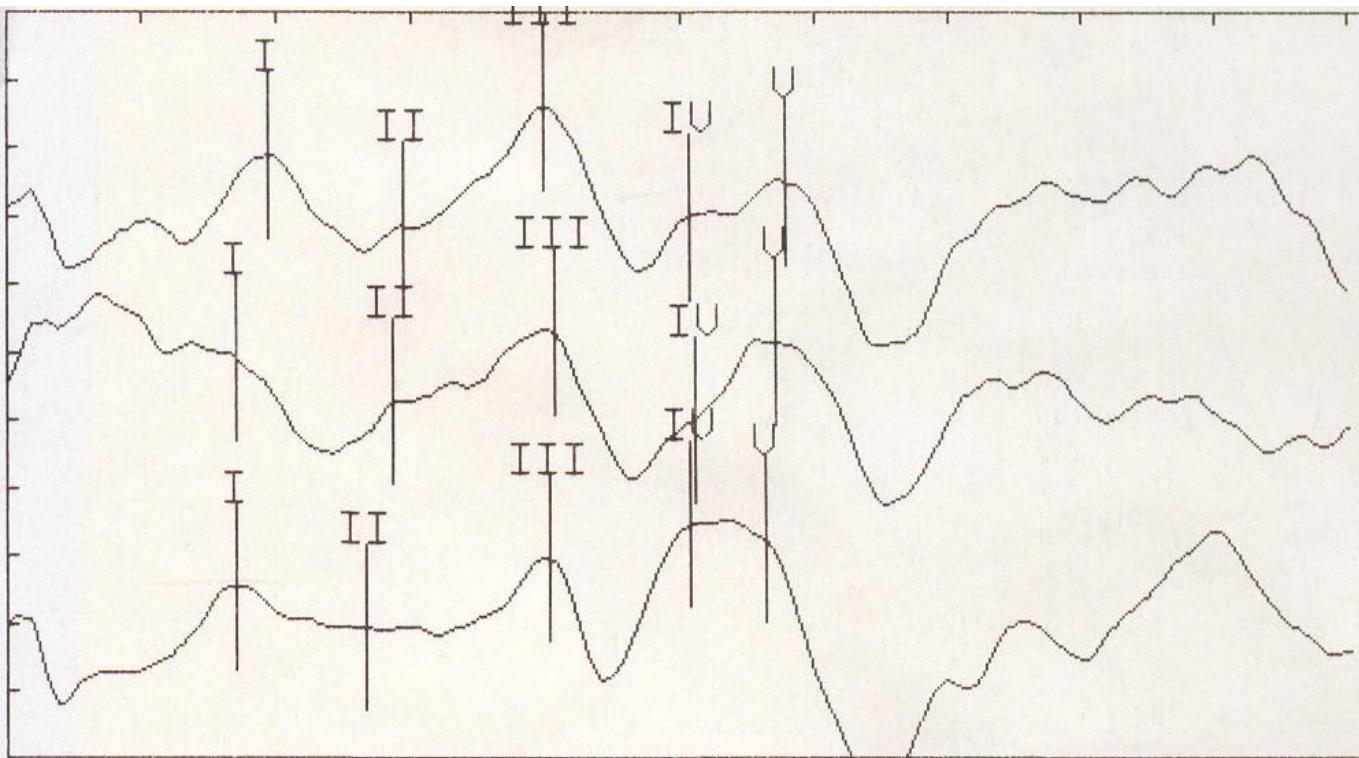

Sensorineural hearing loss

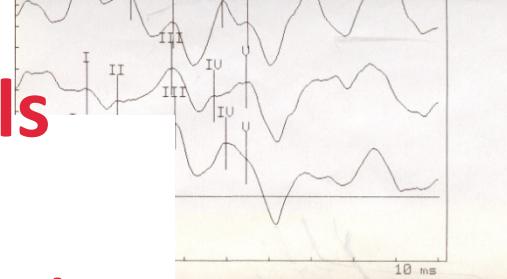

® Auditory evoked potentials (BERA,CERA...)

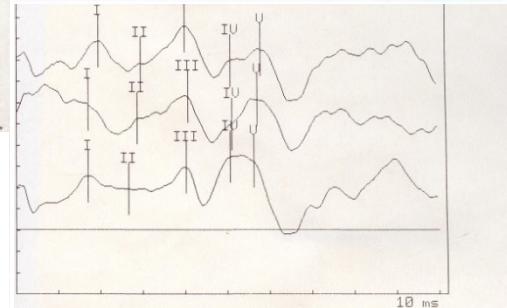

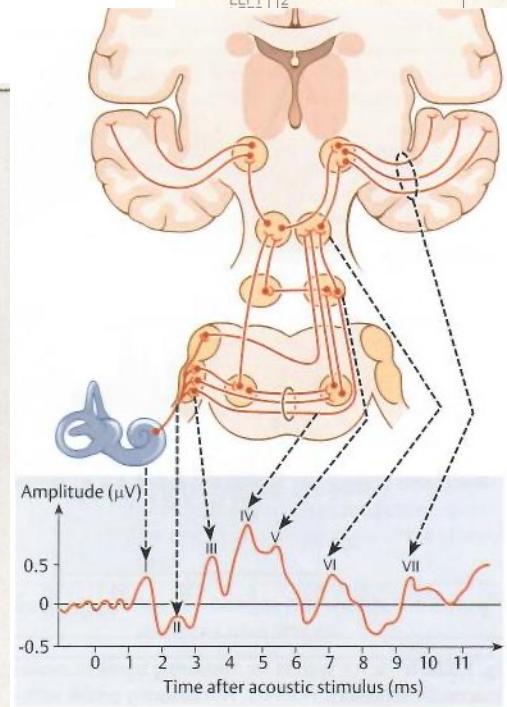

– prolonged latency of 0,2 ms – suspicion
on small schwannoma n. VIII

Patient repeatedly exposed to an acoustic stimulus, an EEG is recorded. **Averaging** – the individual response can be distinguished by mathematical analysis of numerous individual evoked potentials

SIDE	LABEL
LEFT	1
LEFT	2

SENSITIVITY	SIDE	LABEL
1 100 nV/div	1	1
2 100 nV/div	2	2
3 100 nV/div	3	3

Sensorineural hearing loss

According to type of audiology curve:

- Basocochlear
- Pankochlear
- Apicocochlear
- Mediococholear

**According to
lesion localisation:**

- Cochlear
- Retrocochlear

Cochlear lesion

- bothering, but not life threatening

Retrocochlear lesion

- bothering, but also they could life threaten

Sensorineural hearing loss (intra) cochlear

= damage of cochlear structures

Etiology:

- Presbyacusis
- Heredo-degenerative
- Noise damage
- Toxic damage
- Menier's disease
- Acute sensorineural hearing loss
- ... etc.

Sensorineural hearing loss retro- (supra-) cochlear

= damage of structures proximal from cochlea

Etiology:

Demyelization

- atherosclerosis
- sclerosis multiplex

Inflammation

- borreliosis
- neuro-viruses
- meningitis
- meningoencephalitis

Tumors

- vestibular schwannoma
- meningioma
- other tumors of cerebellar angle

Trauma

- commotion, contusion
- scull base fractures

1. Subjective tests:

- time demanding
- active cooperation of pt
- complicated for understanding
- relatively low validity

2. Objective tests :

- time usually not so demanding
- demand only passive patient cooperation
- expansive technical equipment
- high validity

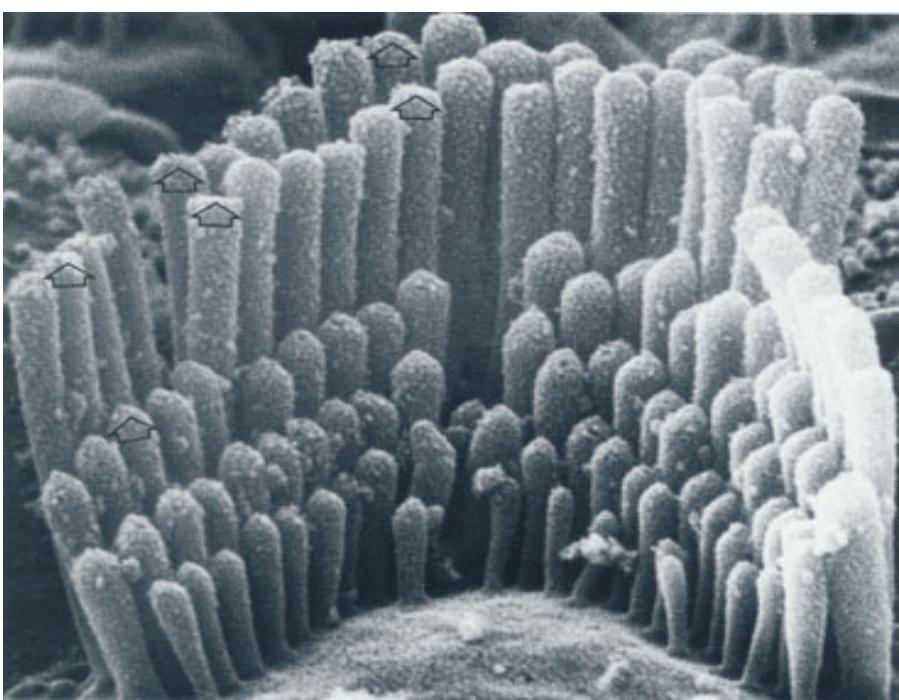

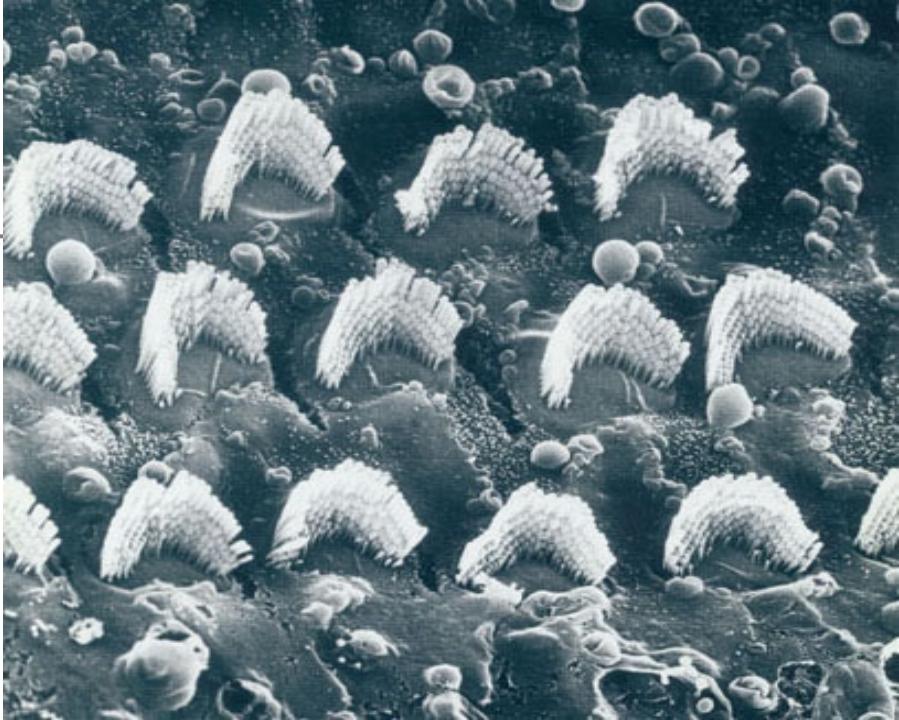

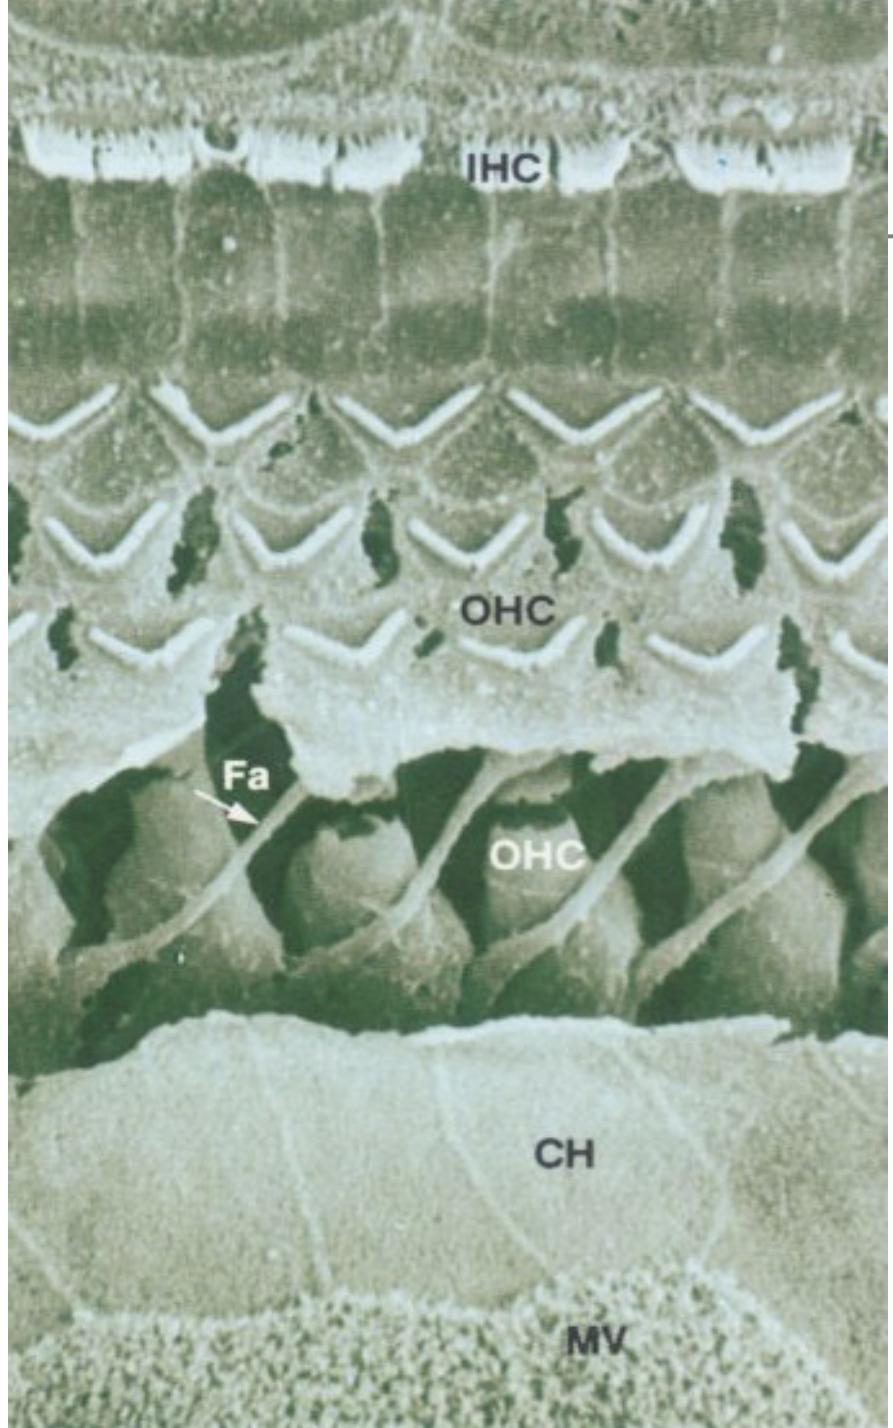

Subjective tests

Based on proof of:

mask effect of noise

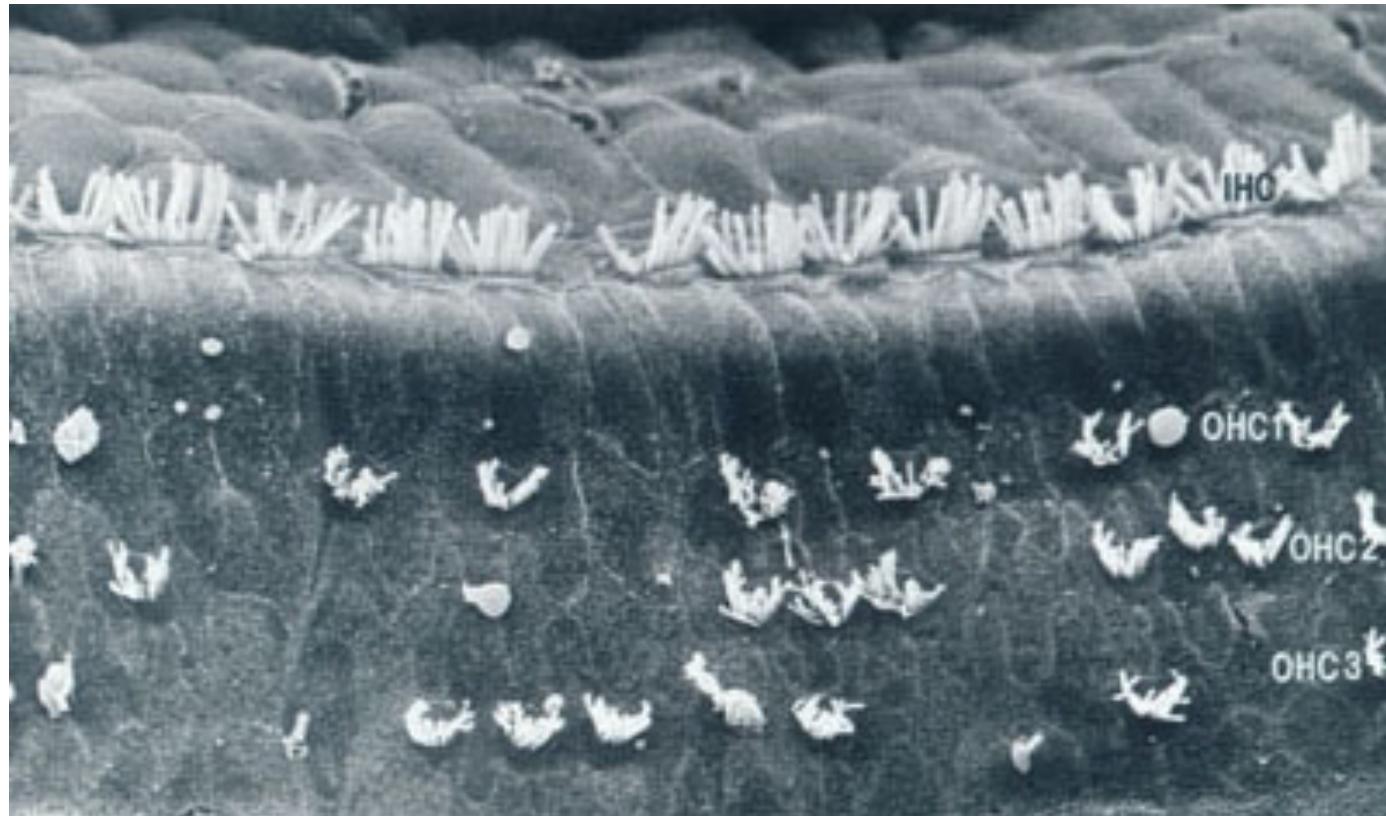

recruitment phenomena

wearisomeness of hearing organ

Recruitment phenomena

= abnormal increase of loudness in above-threshold in damage of OHC and normal function IHC

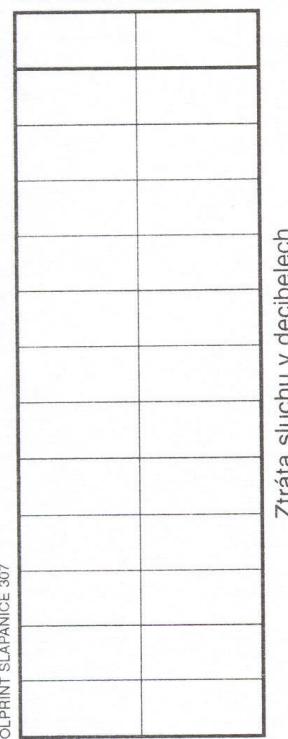

SI-SI Short Incremental Sensitivity Index

short time 1 dB increase of intensity 20 dB above threshold (20x)

assuredly recognize

Tympanometry

The greater the pressure differential (before and behind ear drum), the greater is the impedance of tympanic membrane and **more acoustic energy is reflected back** into external meatus. The level of testing tone in meatus is measured by sensitive microphone .

Tympanometry
