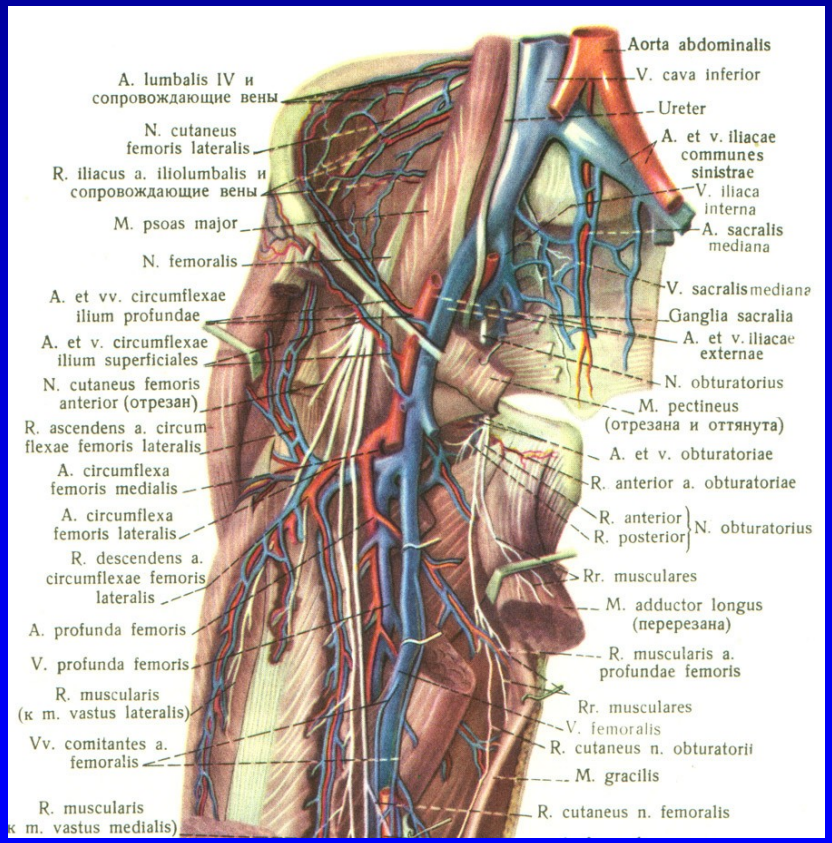
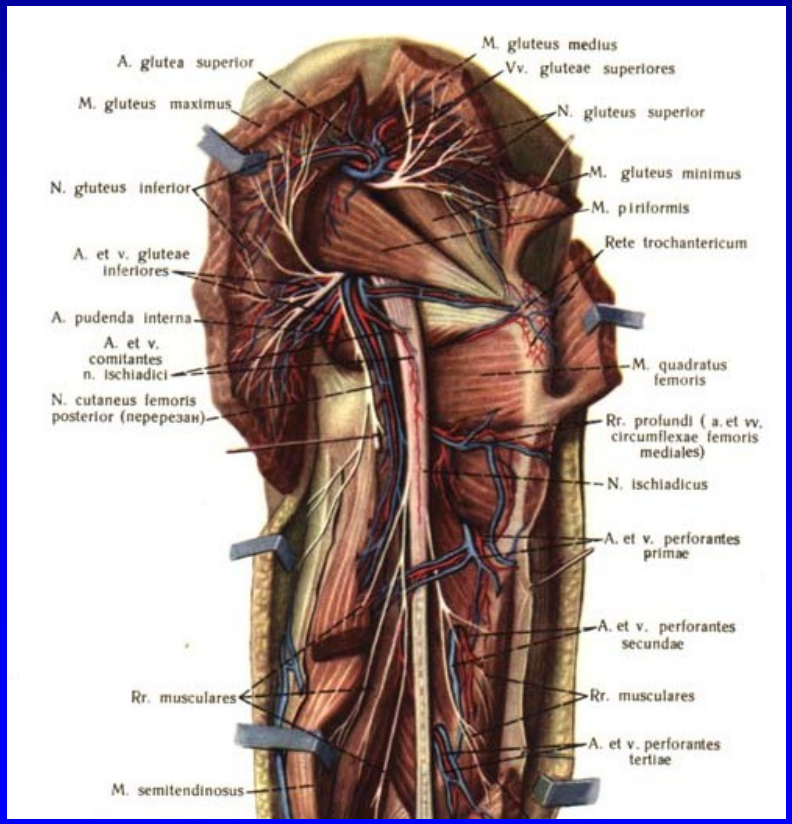
Femoral nerve



Sciatic nerve



THR indications

- Painfull hip joint condition
- Poor effect of conservative therapy
- Life comfort deteriorated
- No salvage surgeries indicated

Indications

Primary osteoarthrosis

Secondary osteoarthrosis:
congenital, posttraumatic,
after infection

Rheumatoid arthritis
Psoriatic arthropathy

Avascular necrosis
of the femoral head

Primary osteoarthritis

THR indications

- OA primary
- OA secundary
- Psoriatic arthropathy
- Aseptic femoral head necrosis
- Rheumatoid arthropathy
- Tumors
- Intracapsular femoral neck fracture, no indication for OS or conservative therapy (vital indication!)

THR contraindications

- Poor general condition, poor physical status (ASA IV)
- Persistent infection
- Severe comorbidity with poor prognosis
- Extreme obesity
- No compliance

Contraindication

- Active infection of the hip
- Infection in the body
- General condition not good
- Neurogenic arthropathy
- Extreme low bone quality
- No cooperation of the patient

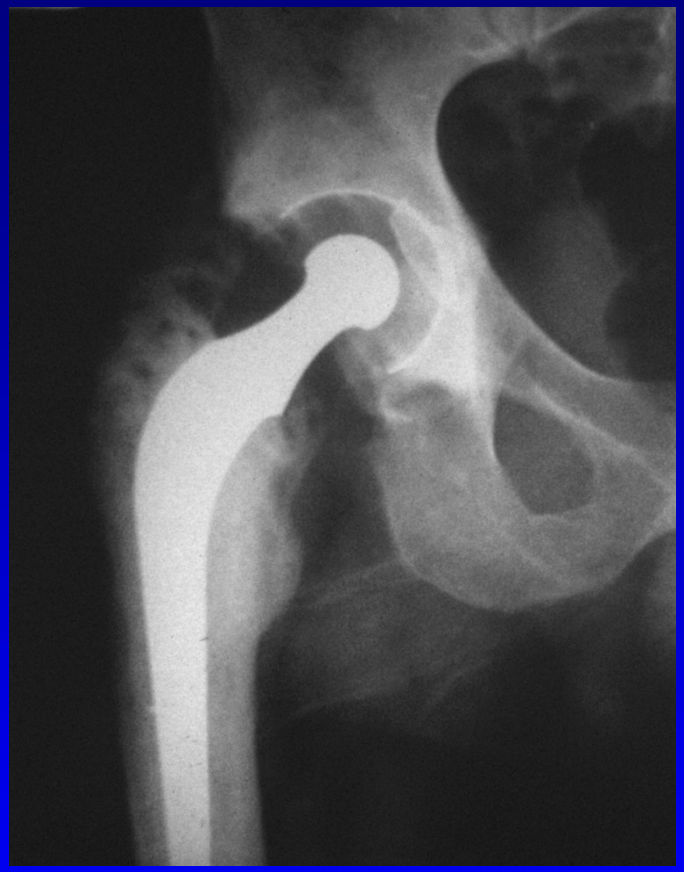
  elevated ESR, CRP

History

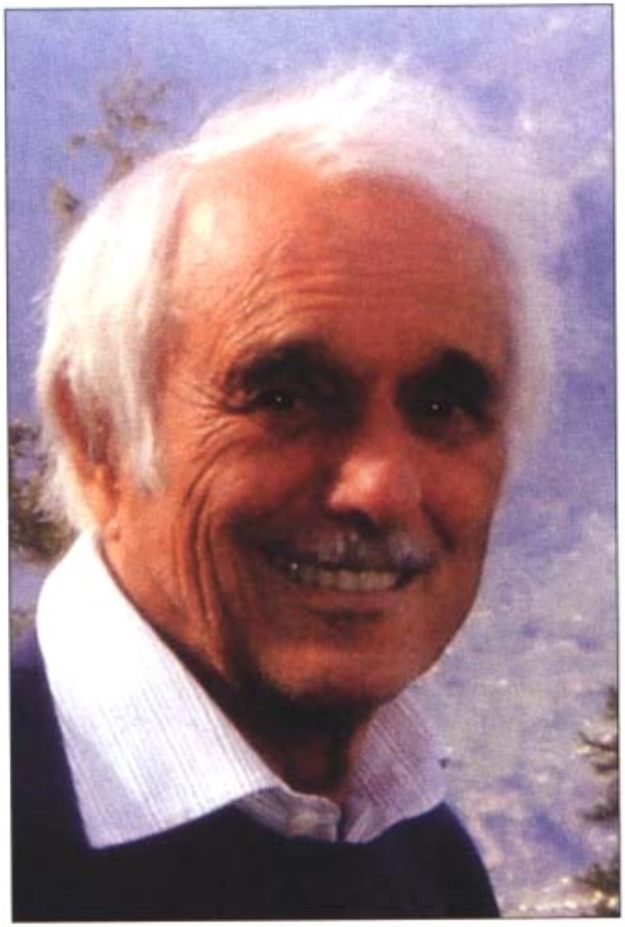
Sir John Charnley
Low friction arthroplasty
Acrylic dental cement

Polymethylmetacrylate
– bone cement

1962



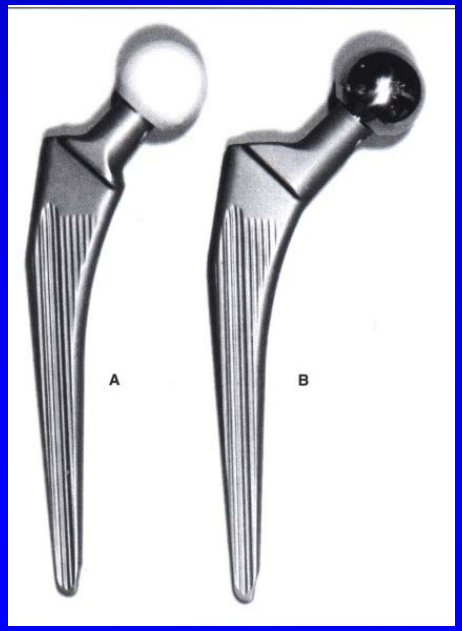
Low friction arthroplasty



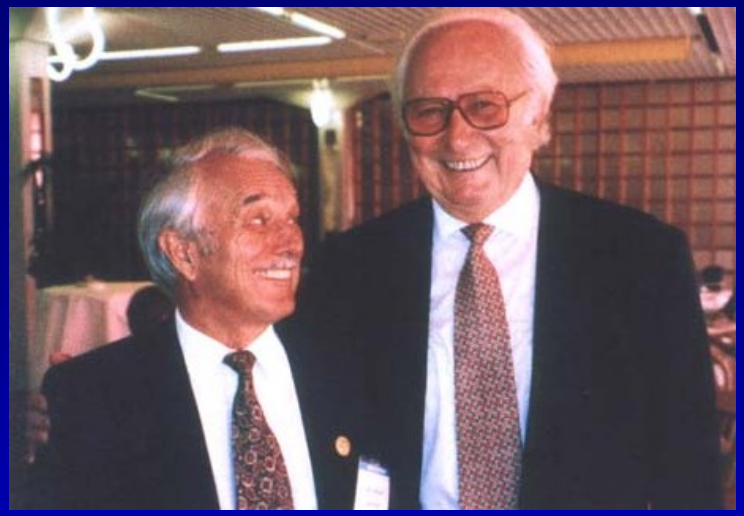
Prof. M. E. Müller

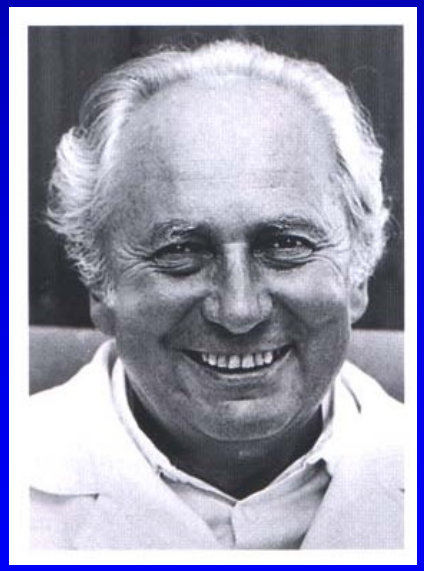
1964 -1965
Setzholzprothese

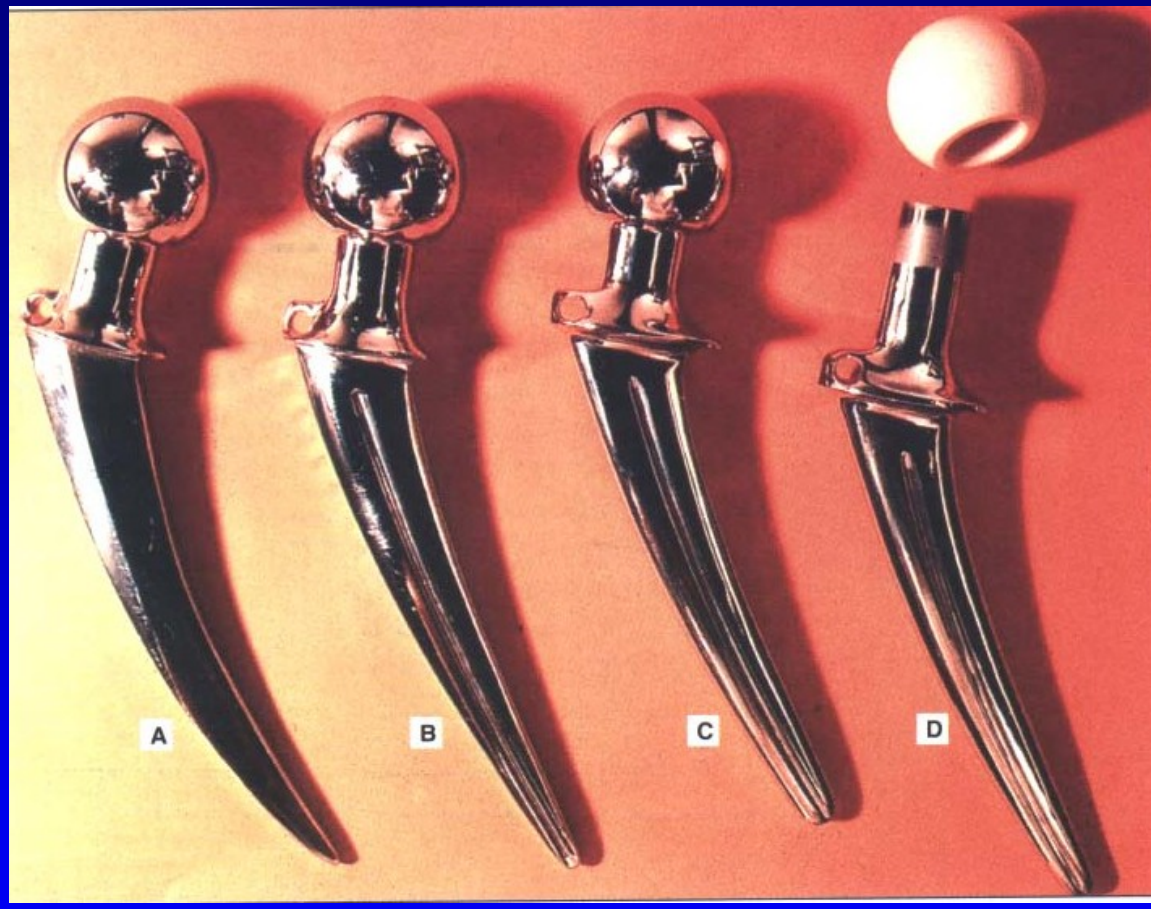
1966
Banana - shaped



1977
Geradschaftprothese







1972

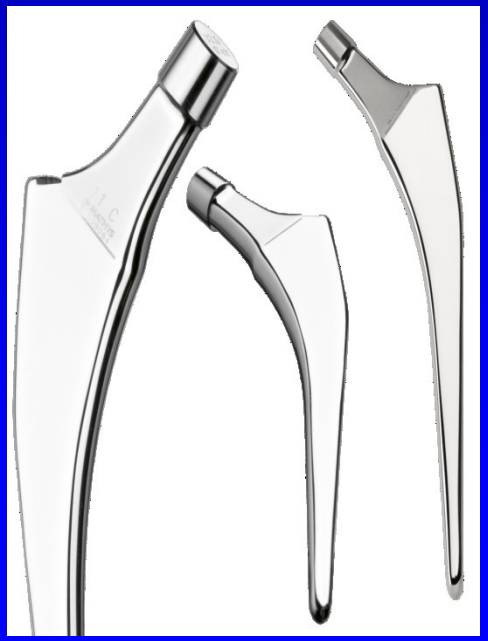
1986

Stems Poldi- Čech

Prof. MUDR.Oldřich Čech, DrSc.

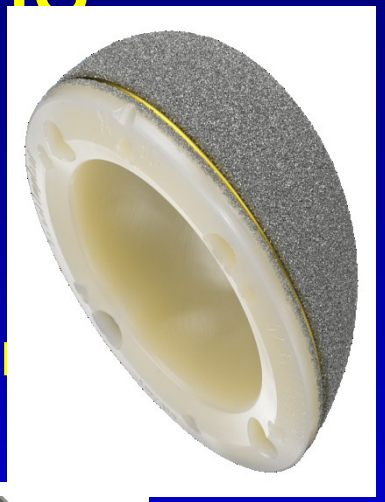
THR fixation options

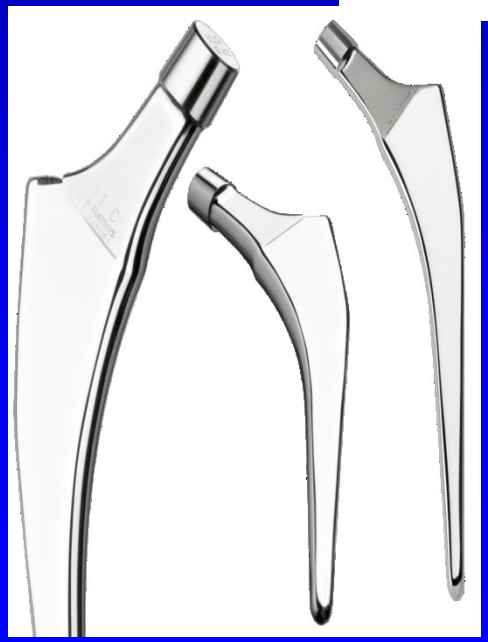
- Cemented
  - Both components fixed with bony cement
  - Older patients > 70 y.o.
  - Poor bone quality - osteoporosis



THR fixation options

- Hybrid
  - One component fixed with bone cemen
    (femoral)
  - 65-70 y.
  - Better implant survival

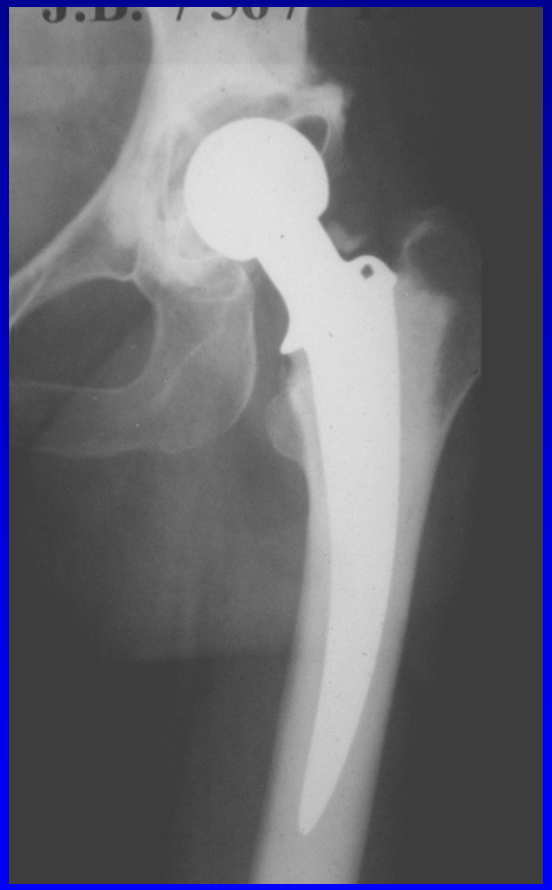




THR fixation options

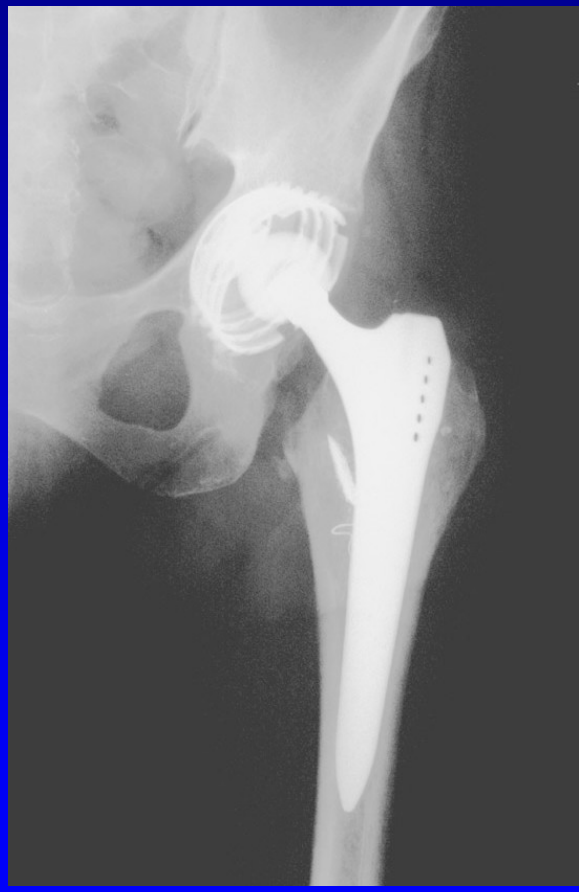
- Cementless
  - Both components fixed without cement
  - age bellow 65 y.o.
  - Good bone quality
  - Contraindication for bone ceme (alergy, right ventricle function)
  - Best implant survival
  - The most expensive

Fixation in the bone
Types of THA



Cemented

Hybrid



Uncemented

Primary THA

Polyethylene cup

Head

Neck

Stem

Revision THA

For tumors

Femoral head prosthesis

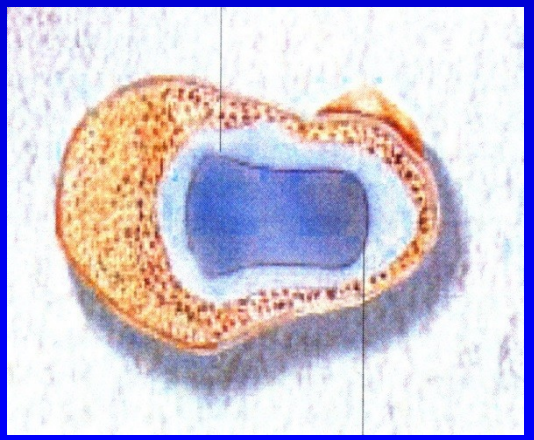
Thompson

Metal

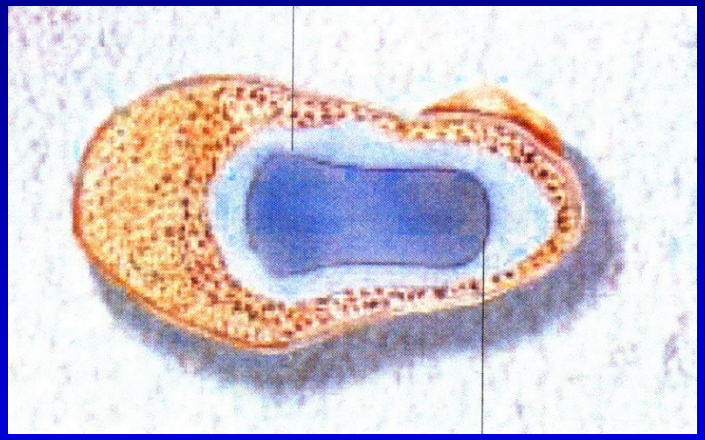
- Steel
- Cobalt - chromium-molybdenum alloys
- Titanium alloys

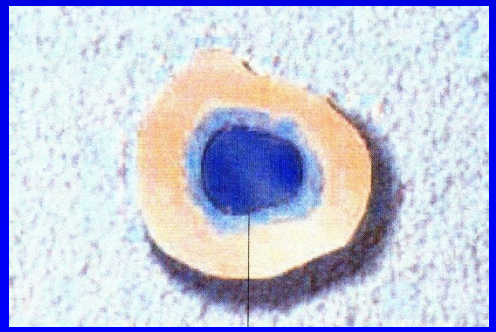
Bone cement

- Polymethyl methacrylate (metylesther metacrylic acid)
- Powder polymer, liquid monomer
- Exotermic response
- Stabilisation of the implant in 10 minutes
- Cytotoxic effect
- Protein coagulation (termical + chemical)
- Microembolisation



Cemented THA

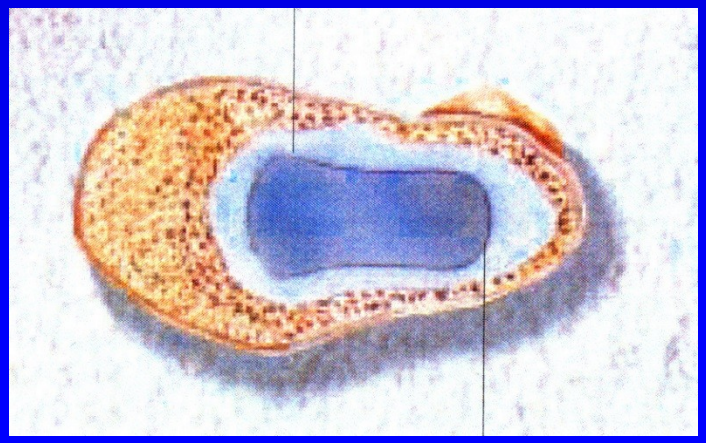


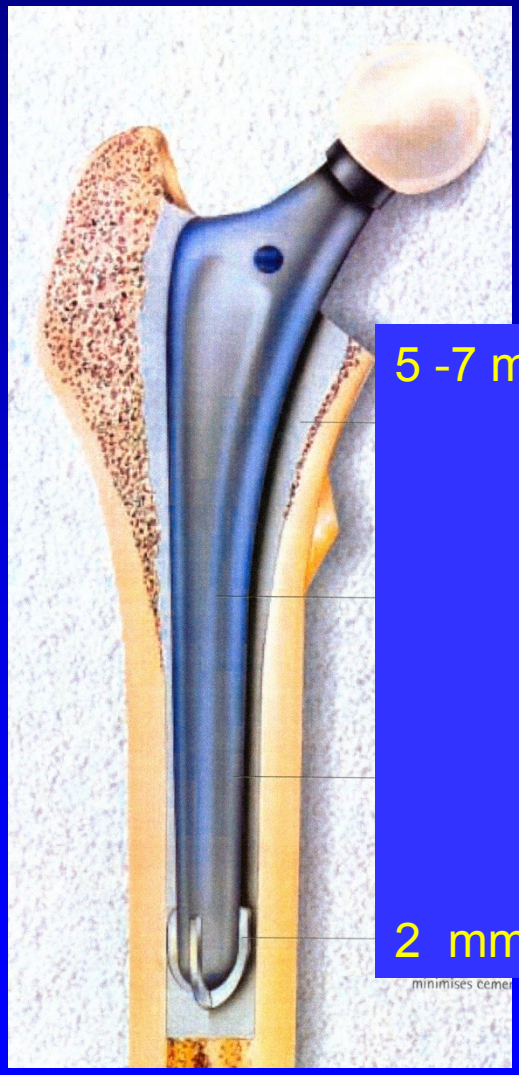


Cementing technique

- Interdigitation into bone trabeculae

- Regular layer:
  under the cup 3 mm
  around the stem 2- 7 mm





Polyethylen

- UHMWPE :

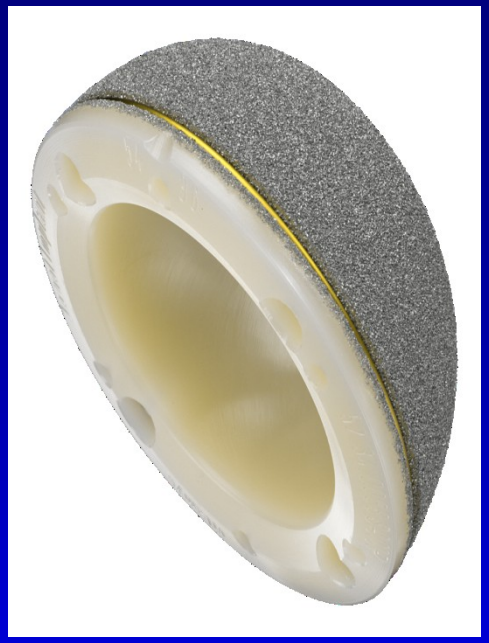
  ultra- high- molecular- weight- polyethylen

PE

- Polyethylen
  - Longest used material for cup
  - Viscoelastic
  - Plastic deformation (cold flow)
  - Higer wear rate
  - Oxidative degradation

PE

- Polyethylen
  - UHLMWH - Ultra high molecular weight polyethylen
  - HXLPE – cross - linked
  - PE + vit E
  - Aim:
    - Wear reduction
    - Oxidative degradation reduction
    - Keeping elasticity modulus

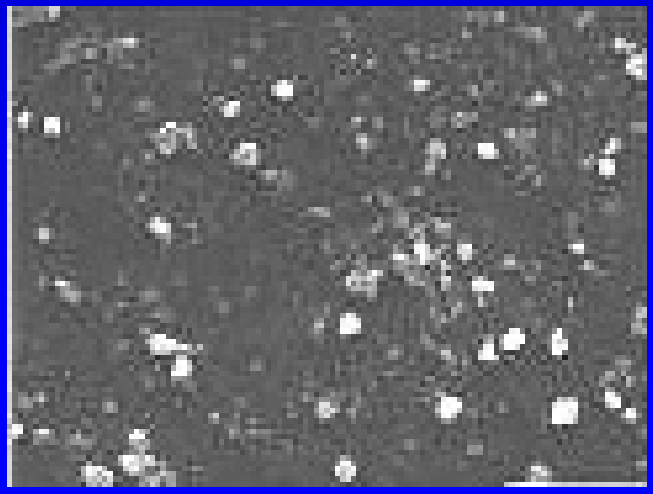


Polyethylen

- Linear wear 0,1 - 0,2 mm / year
- Volumetric wear 0,3 - 10 mg / year

- Cold flow – plastic deformation
- Abrasion and delamination
- Oxidative degradation

- Modern trends:
  highly crosslinked polyethylen
- with vitamin E



PE wear particles, 1 um

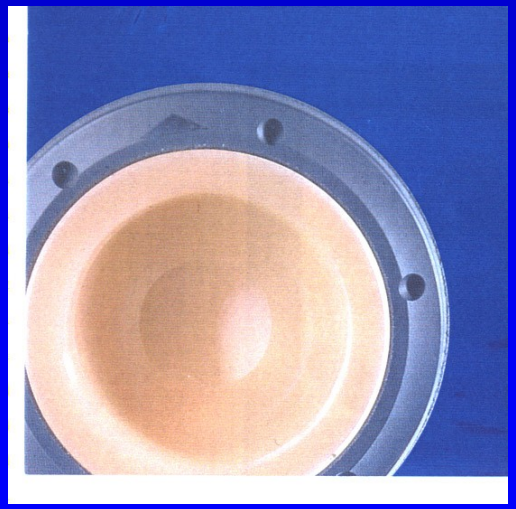
XPE- highly-cross-linked polyethylen + vitamin E

Antioxidant

Increases mechanical properties of PE

Ceramic

- Corundum or Zirconium AL_2O_3
- Smooth surface
- Less wear: 0,005 - 0,15 mm / year

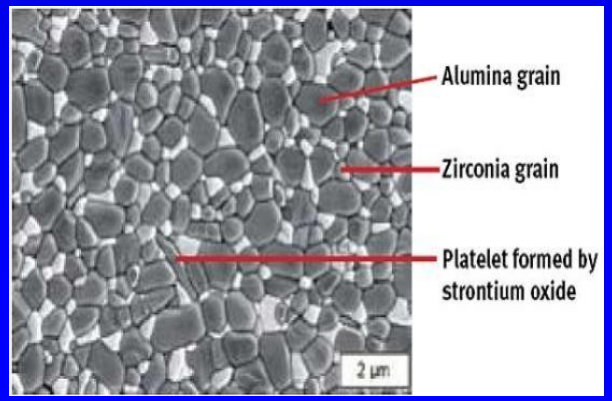


Materials – ceramic

- Pure aluminium oxide - AL_2O_3 - corundum
- ZrO_2 – zirkonium oxide
- Extremely smooth surface, minimal friction ratio
- An order of r
  rate comapa
- Fragile
- Expensive

Materials – ceramic

- Biolox forte
  - Pure AL_2O_3 (yellow)
- Biolox delta
  - Stronger
  - Lower grain size – even more s
  - More homogenic
  - Pink
  - AL_2O_3
  - ZrO_2
  - Zirconium oxides stabilized by

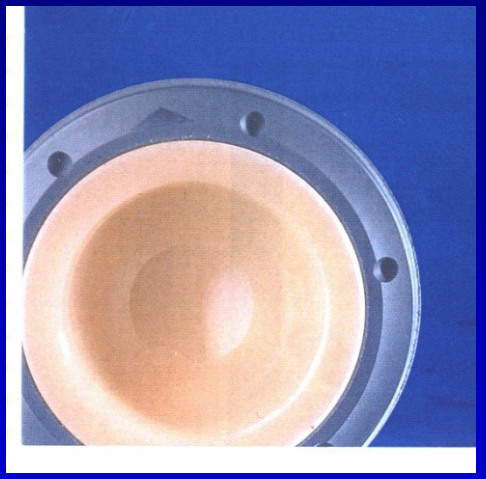


Materials – Oxinium

- Zirconium oxides
- Combines properties of alloy and ceramic
- 2x harder than ceramic
- Abrasion and scratch resistant
- Fracture resistance
- Trace amount of Ni only (hypoallergenic)
- 20% lighter than CoCr

Contact : head - cup

- Metal- polyethylen
- Ceramic- polyethylen
- Ceramic -ceramic

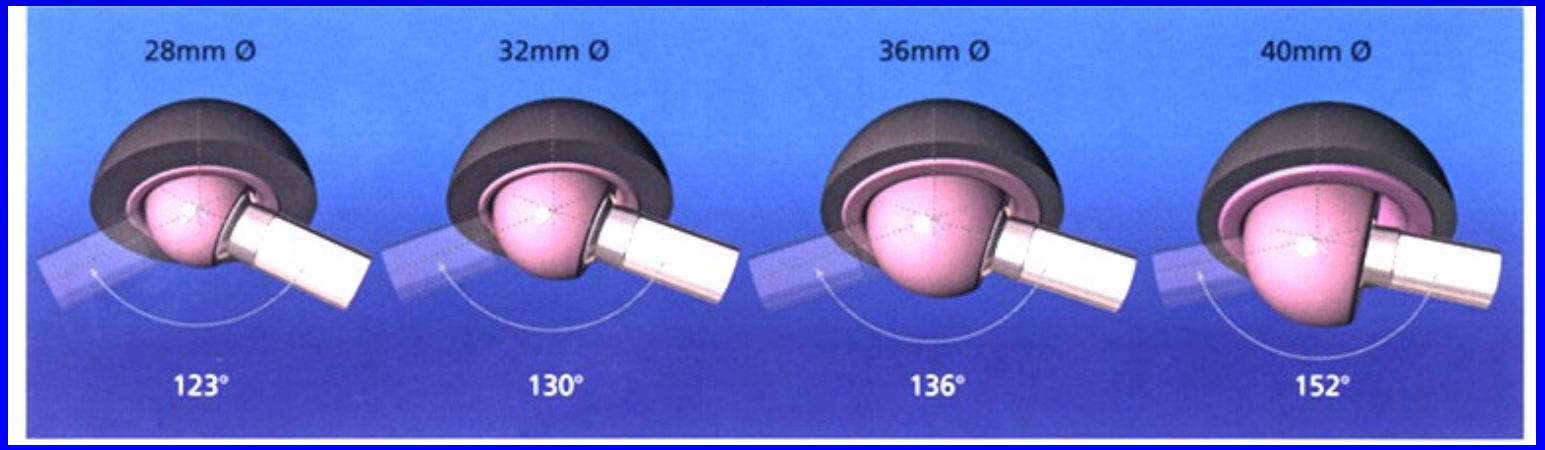


Diameter of the head

22, 28, 32, 36, 38, 40 mm

Advantage of 36 mm head:

Higher stability
Greater range of motion
Less impingement neck- edge of the cup



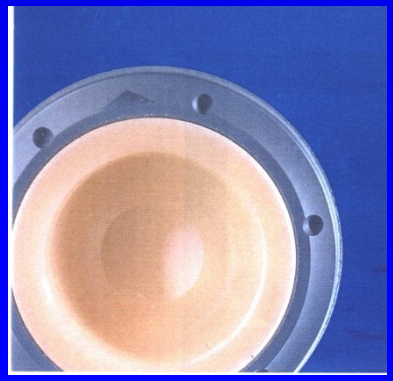
Acetabular component

- Cemented: polyethylen

- Noncemented: metal- backed

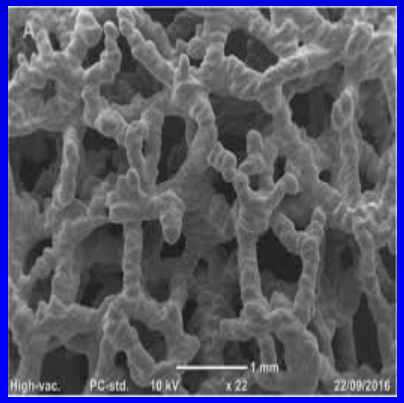
  with PE insert

  with ceramic insert



Materials

- Cementless implants requirements – bone adjacent surface
  - Trabecular titan
  - Trabecular tantal
  - Hydroxyapatite surface



Hydroxyapatite surface

Bioactive

Osteoconductive

Chemical bonds bone- hydroxyapatite

Surface of cementless implant

Macroporosity

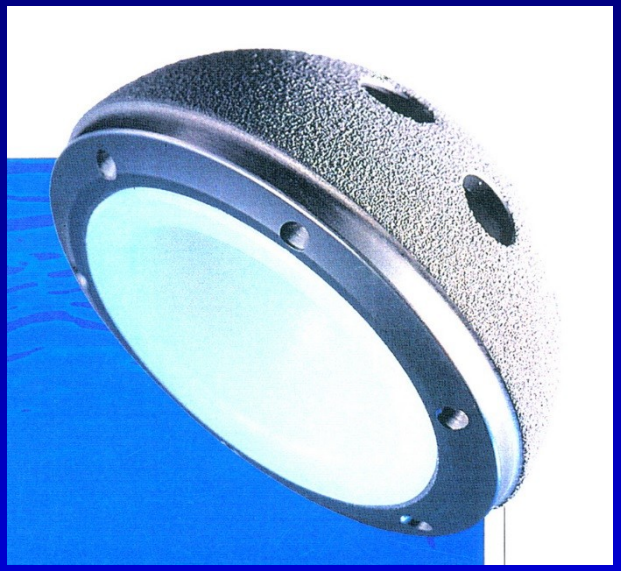
Microporosity

Pores on the surface 50μm - 600 μm

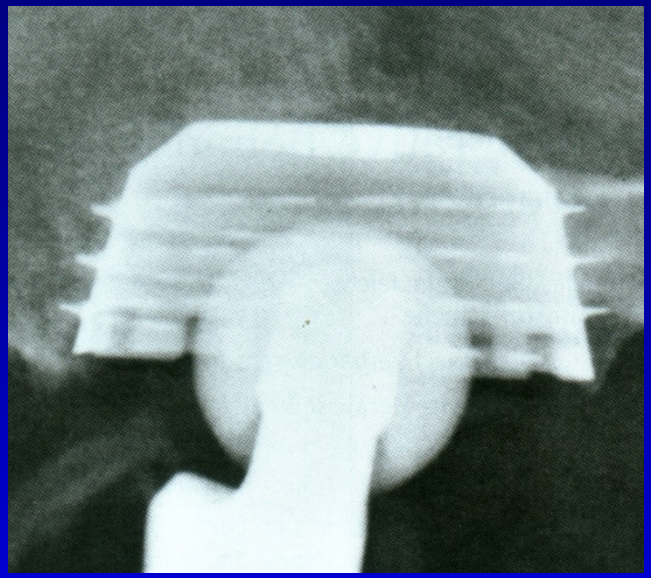
Pores above 800 μm- fibrous tissue

Adhesive surfaces:
Trabecular Metal
Trabecular Titan
Pores 300 μm
High initial stabiity

Uncemented cup



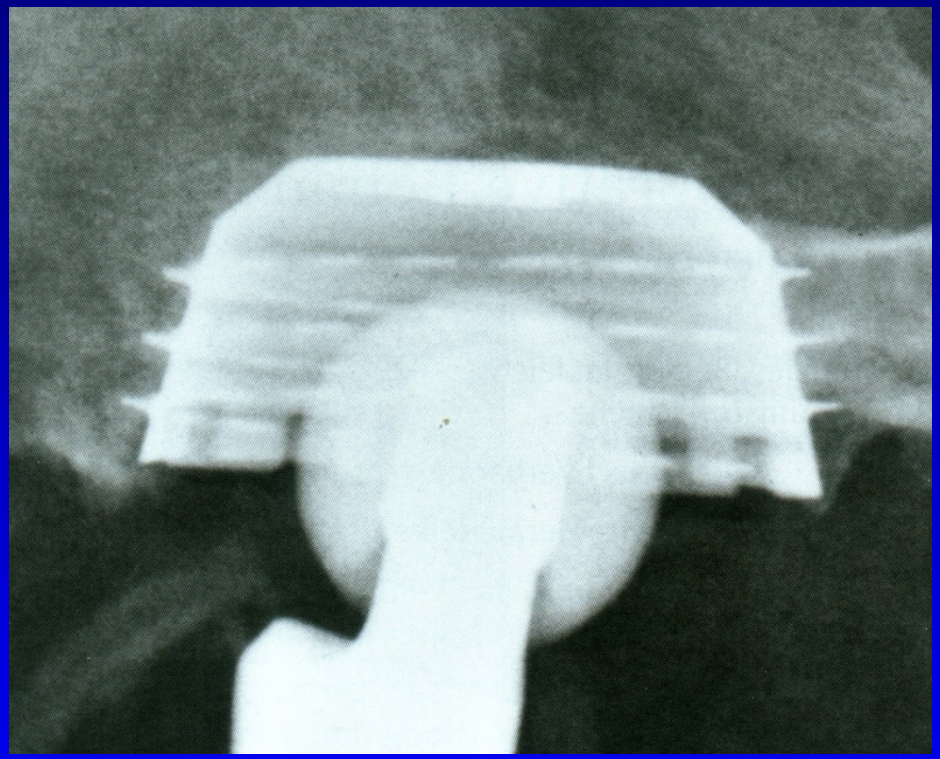
Press - fit



Threaded

Primary fixation: mechanical anchorage in the bone

Uncemented cup

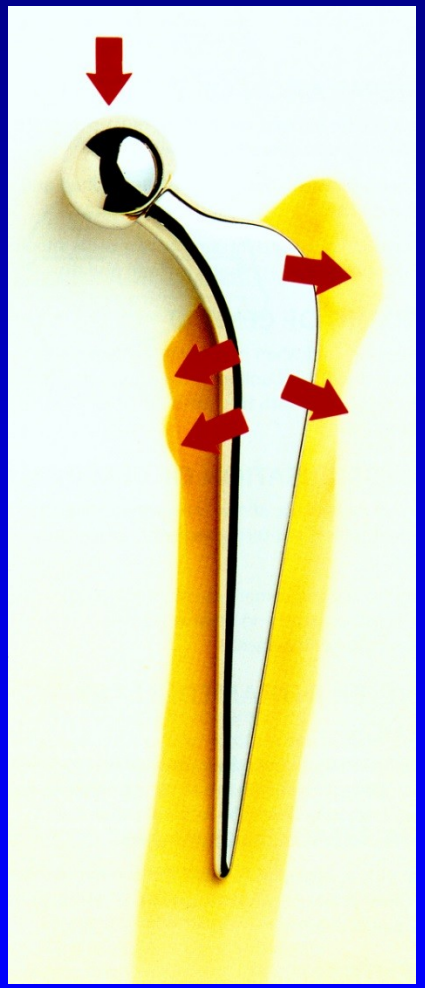


Secondary fixation: osteointegration of the implant on the surface of bone

Bicon – Zweyműller cup

Femoral component

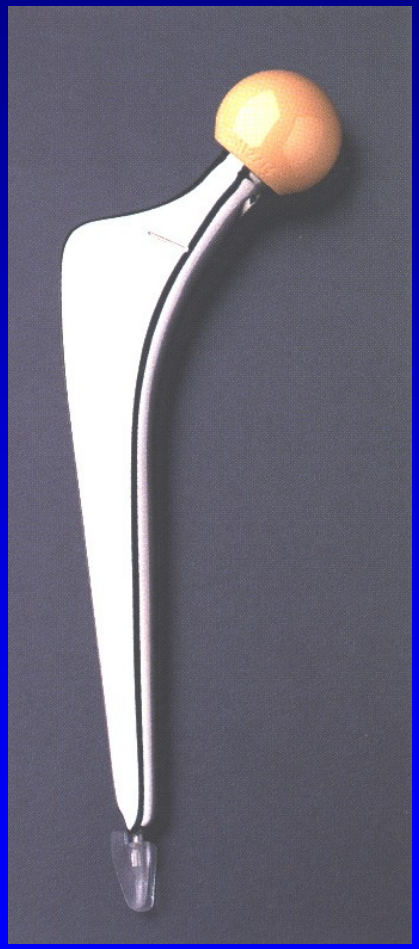
- High polished surface
  for cementing fixation
- Porous surface
  for cementless fixation



Cemented

Cementless

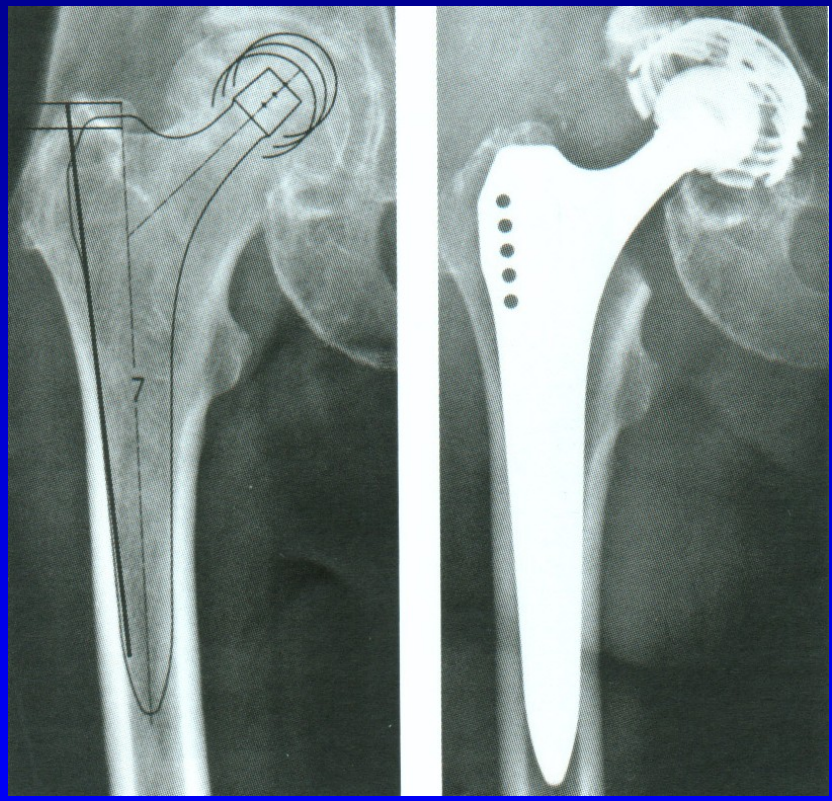
Morscher, **S**potorno MS – 30 stem cemented



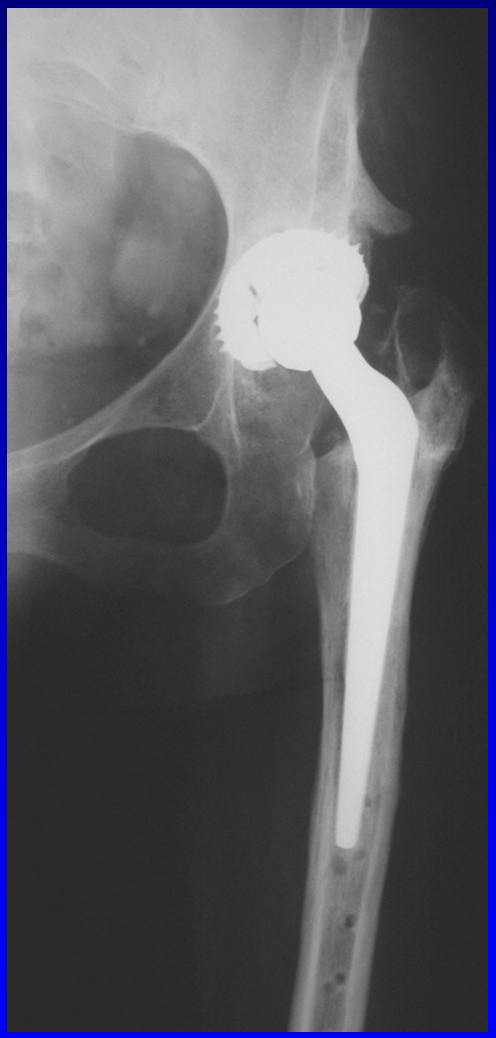
Uncemented stem

- Primary fixation:
- Mechanical anchorage
  in the bone

- Secondary fixation of the implant on the bone surface



Uncemented stems



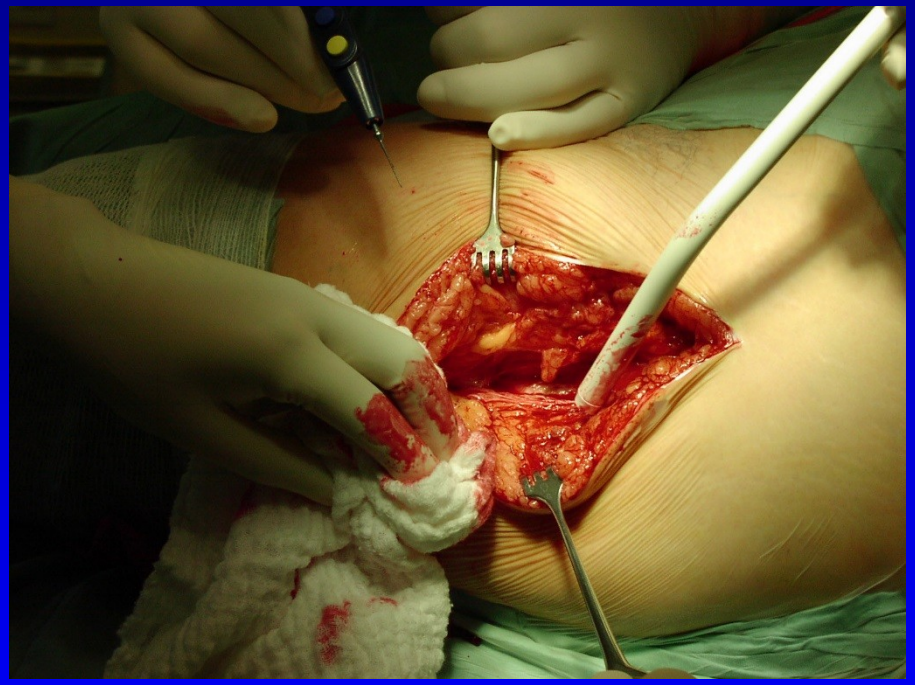
Proximal fixed

Distal fixed

Indication scheme

- Uncemented to 60 y.
- Hybrid 61 - 70 y.
- Cemented over 70 y.

Approaches



MIS- mini invasive surgery

Physiotherapy

Day:
1. Sitting, drainage ex
2. - 5. walking
6. + stairs

7-21 – in physiotherapy dpt.

3 months- spa resort

Full weight bearing. Cemented THA after one month
Uncemented after 12 weeks

Fast track physiotherapy, discharge 3-4 days, home care

Post op. management

- ITU - one day
- Hospitalisation at orthopedic ward for 5 days
- Verticalisation the first post op. day
- Complex rehabilitation protocol, rehabitalitation nurse obligatory
- 6. day – transfer to rehabilitation ward
- Spa resort in CZ covered by public health insurance in 3 post op. months
- DVT prevention – 6 weeks
- Prevention of dislocation of THR- no adduction, no deep flection, no axial extremity traction!
- Modern trends: Shortening of inpatients period (risc of nosocomial infection, economic aspects)
- Fast track physiotherapy
- Outpatient surgery?

Follow up

- Standardized
- First check up: by orthopedical surgeon in 6 weeks (X ray included)
- Second check up: in 3 months, then 6 month
- Every 2 years (X ray included) if no problem present
- EDUCATION
  - Activity, limitation and régime with THR
  - PJI prevention
  - Urgent check – up if suspected PJI

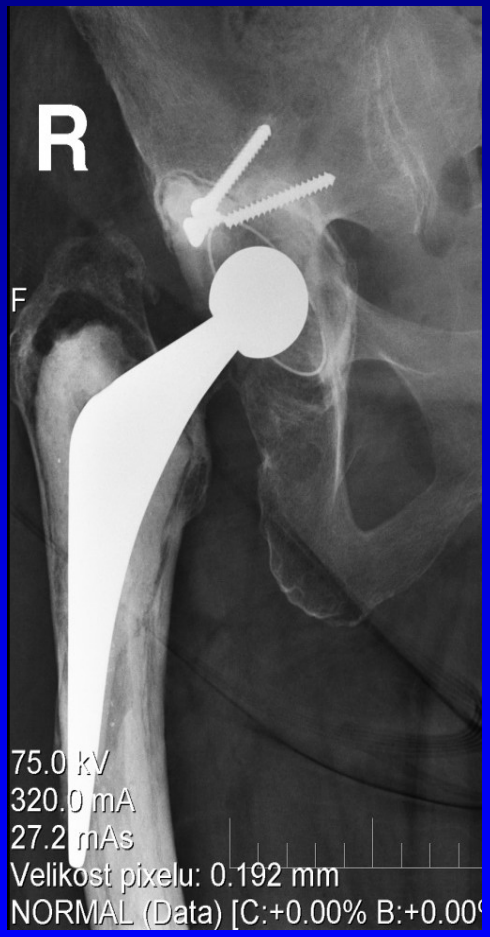
Complications

- Peri and early post op. morbidity and mortality
  - Nervous and vascular injury
  - Blood loss
  - Perioperative fracture
  - Hip displacement (luxation)
  - Pulmonary embolism
  - IM
  - General decompensation
  - Development of delirium

Complications

- THR dislocation
  - Shortening and (extra)rotation of extremity, pain, no active hip flexion
  - No active walking and no weight - bearing
  - Therapy:
    - Close hip redduction attempt. Hip orthesis with reduced ROM obligatory
    - Revision, identification of cause, solution
    - Longer head, stabilisation elements
    - Replantation

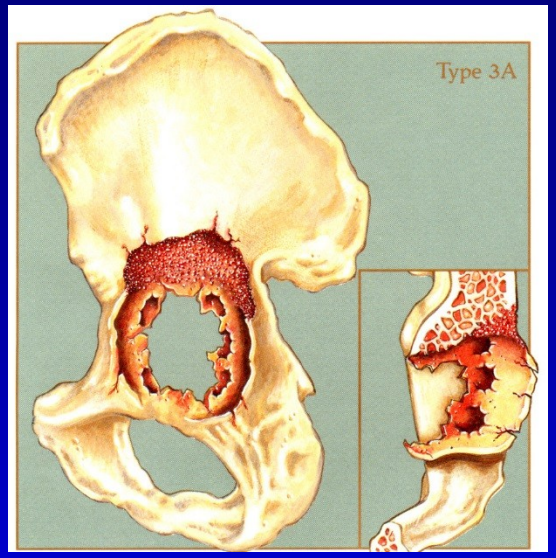
Aseptic loosening - therapy

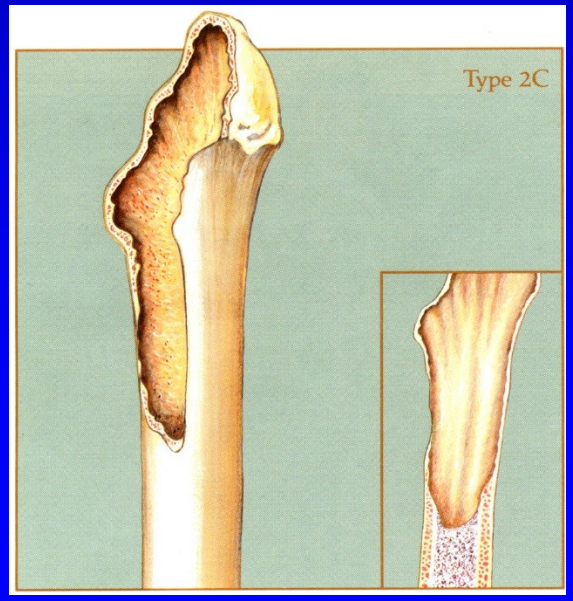


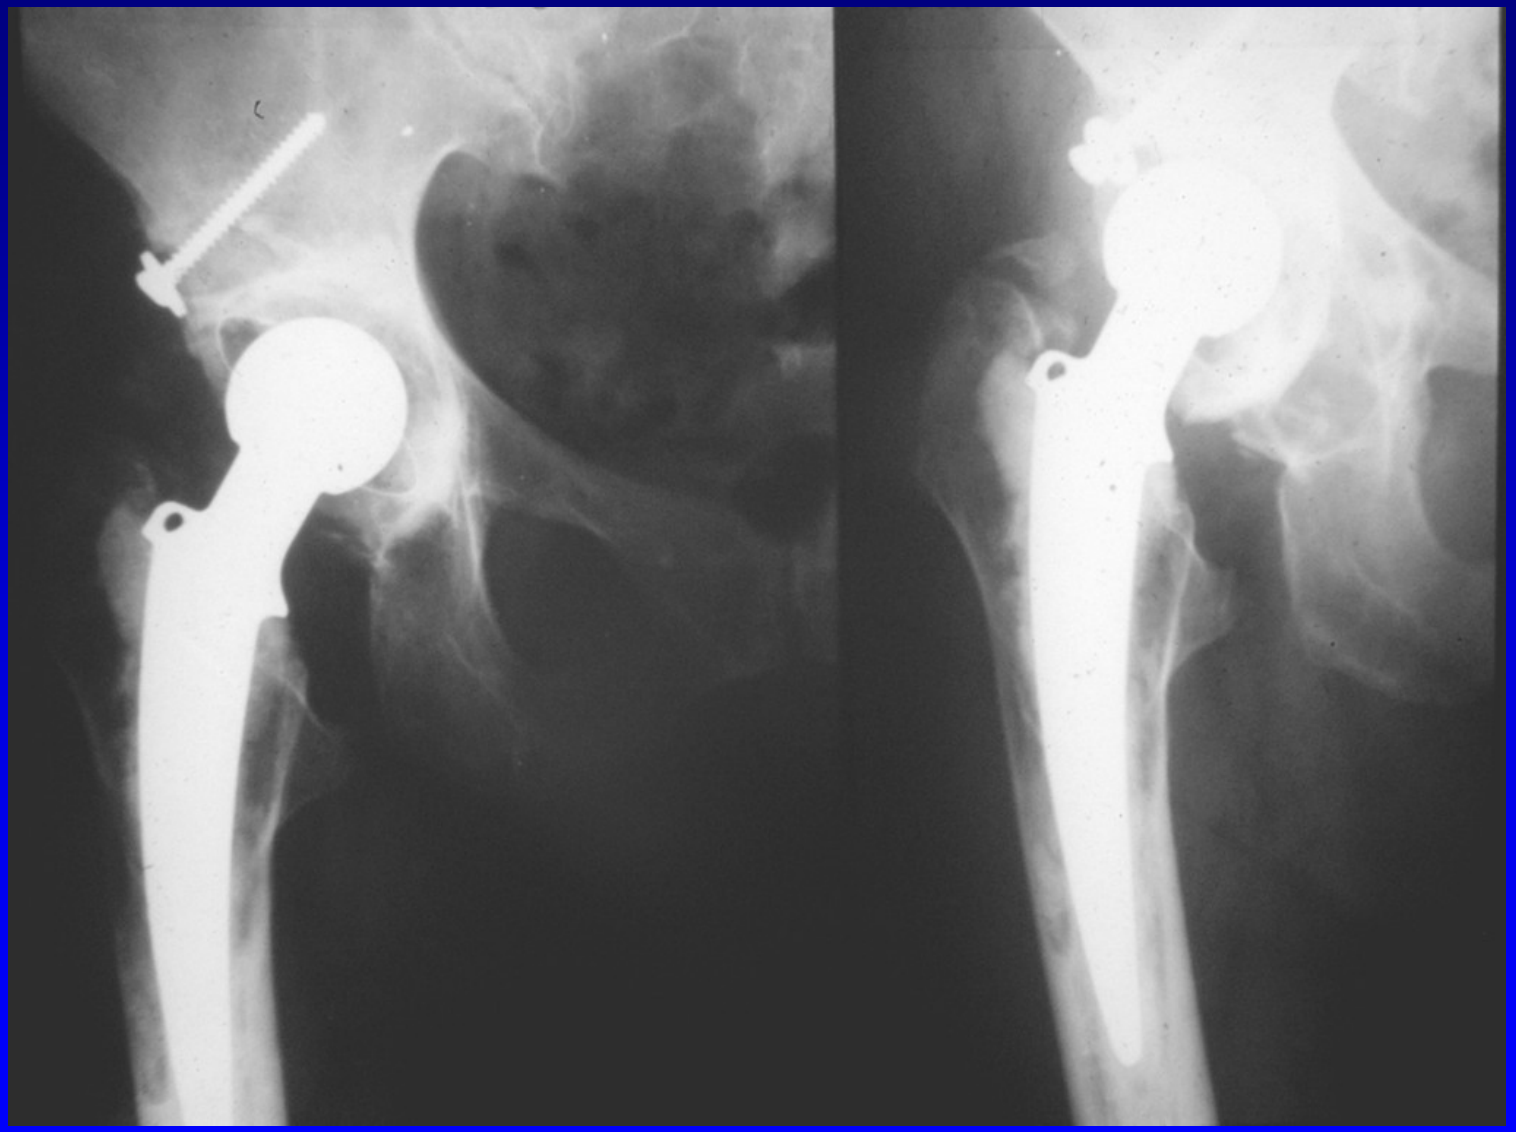
Aseptic loosening - therapy

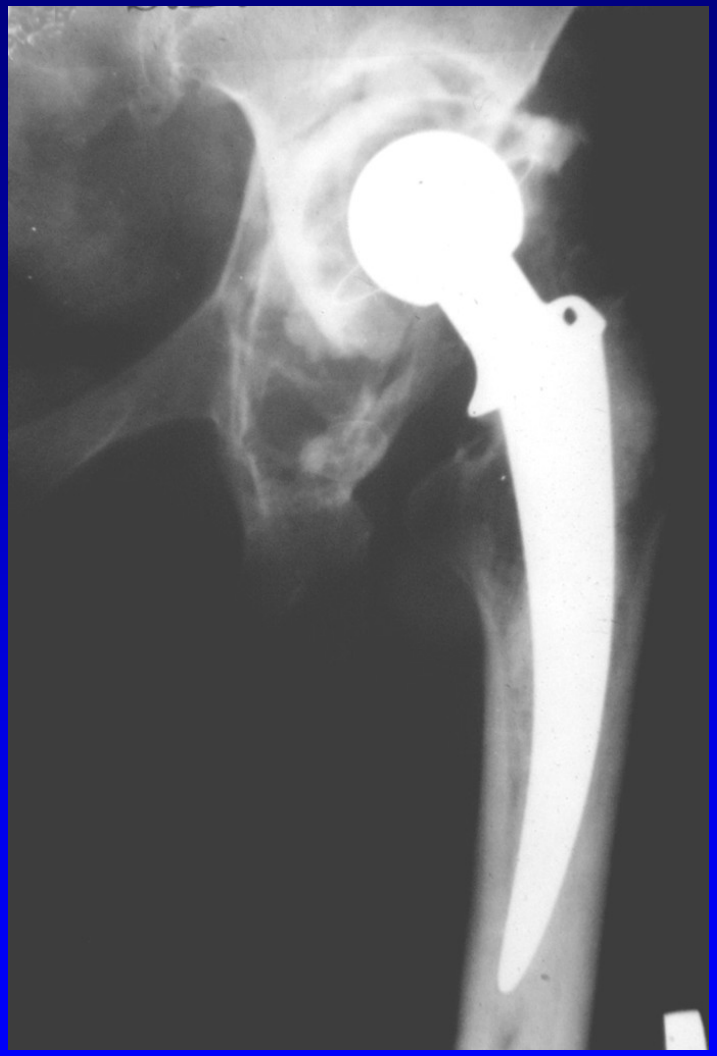
- Revision, replantation
- Revision systems, augments, spongioplasty (alografts)…
- Double ATB combination – higer infection risk
- Higher complication rate
- Inferior outcome
- Lower ROM
- Longer no full weight bearing period (3M)
- Higher mortality
- Higher displacement risk ratio

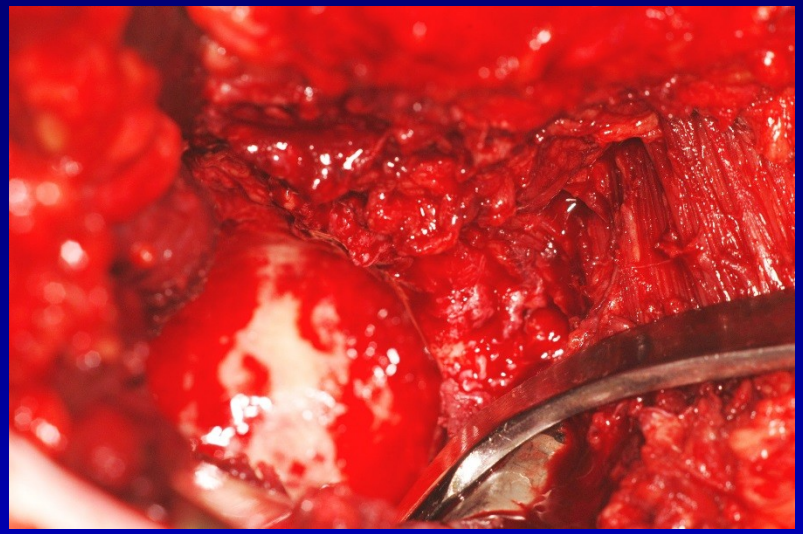
Revision THA

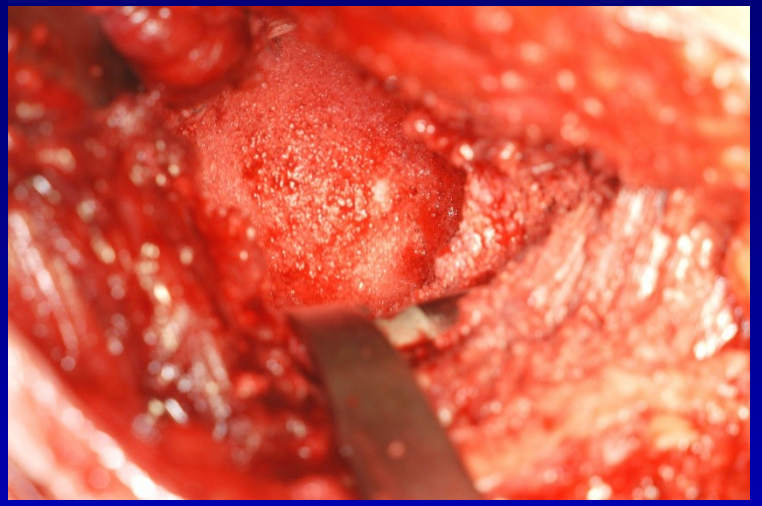




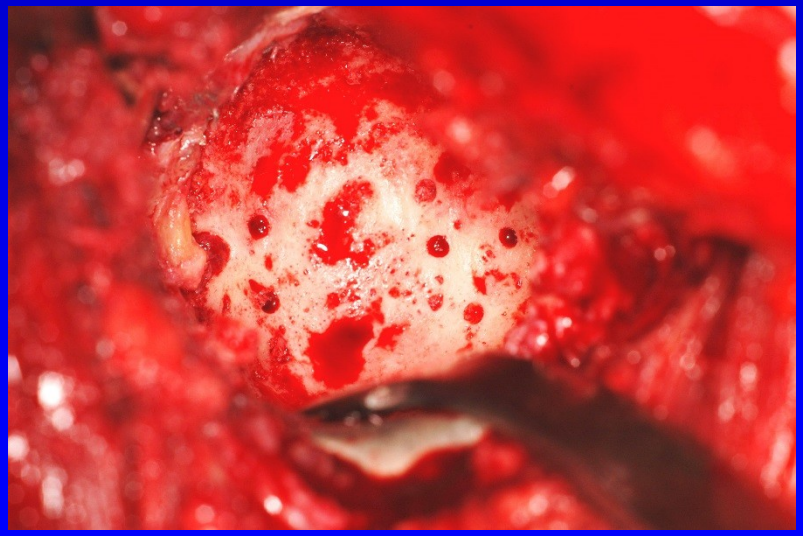


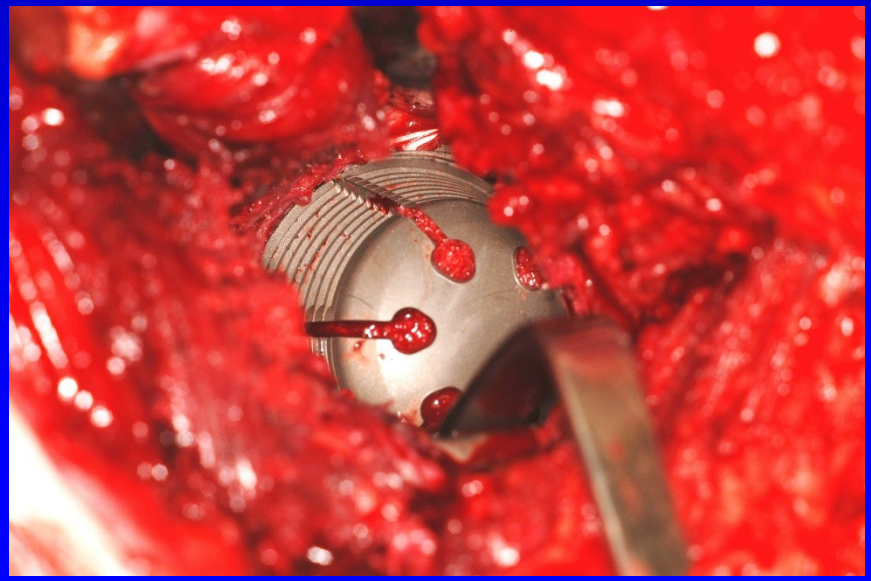






Revision of the acetabulum





Revision THA

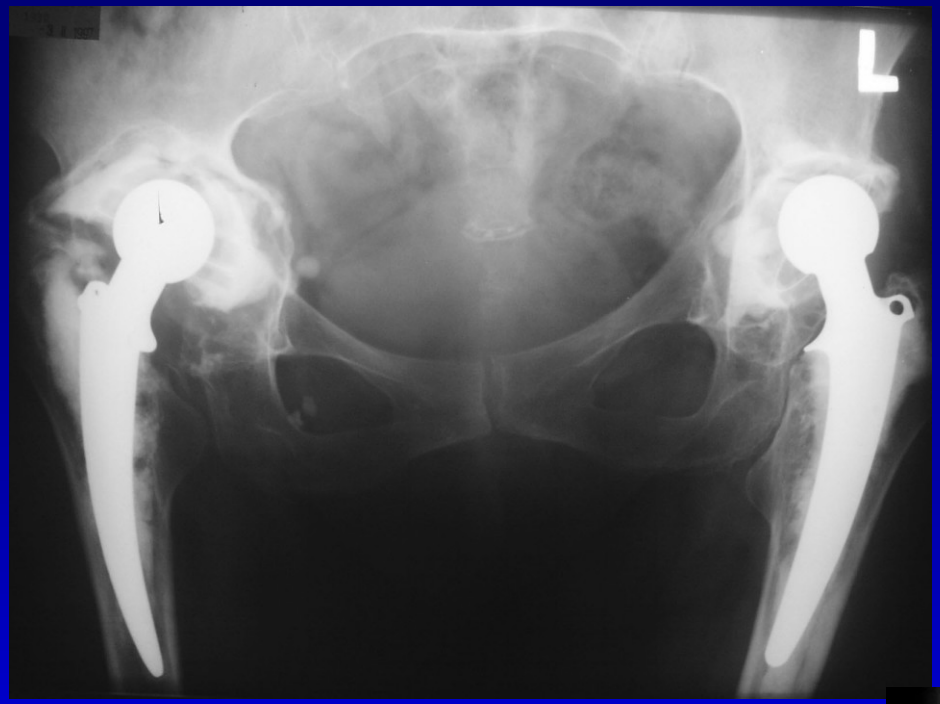
08:19



L

L

Periprosthetic fracture

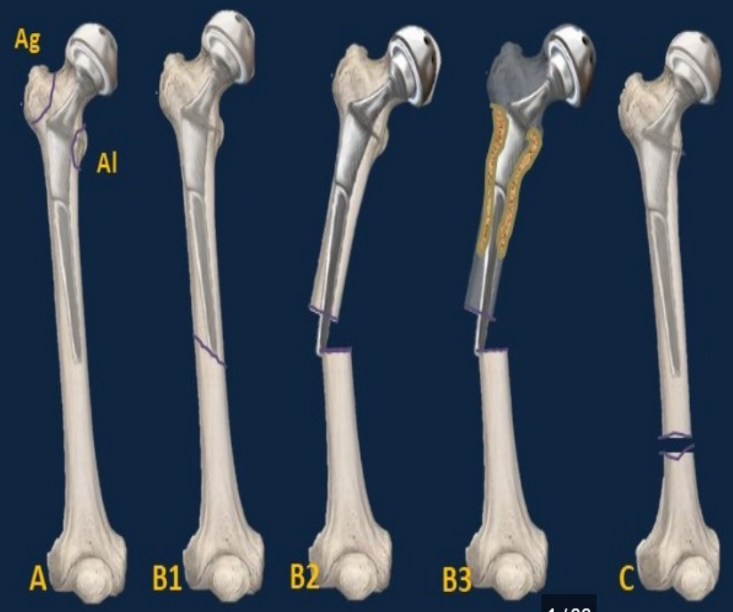
- Relatively frequent complication
- Femur in the most cases, acetabulum rarely
- Older patients, worse general condition
- Osteoporosis, poor implant retention
- High mortality and morbidity rate
- High compliction rate
- Demanding surgeries (experienced surgeon)

Periprosthetic femoral fracture - classification

Vancouver classification of hip periprosthetic fractures

Vancouver classification relies on:

1. The level of the fracture
2. If the prosthesis is stable or not
3. the quality of the bone



Hip periprosthetic fractures	
Type A	Peritrochanteric fractures
	AG: greater trochanter
	AL: lesser trochanter
Type B	Around or just below the tip of the femoral stem
	B1: stable stem
	B2: loose stem
	B3: loose implant with substantial bone loss
Type C	fractures occur well below the implant

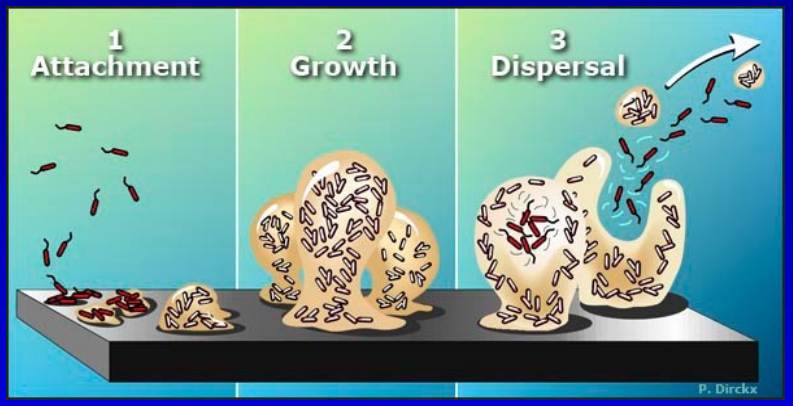
Periprosthetic femoral fracture - therapy

Periprosthetic femoral fracture - therapy

- OS (LCP, control cable)

Periprosthetic infection

St. aureus
St. coagulase negative
Streptococci
Enterococci, others
MRSA, MRSE
Polyresistant G- bacteria



Sessile form and planctonic
Race for surface
They produce glycocalyx- mucose substance of glycoproteins
It leads to high resistence to antibodies and antibiotics

Biofilm

Biofilm

Adhesion of bacteria
- reversible

Exopolymers
- glycolalyx
- extracelular matrix
irreversible

Releas to surrounding tissue

Periprostetic infection- diagnostics

Clinicly
Labor: CRP, leu, ESR
aspiration of pus
X-ray- osteolysis, loosening
USG (abscesus)
Scintigraphy
Sonication of the implant
Bacteriological examination
Long cultivation

Periprostetic infection- PPI

Acute PPI

Chronic PPI

Late haematogenic PPI

Management

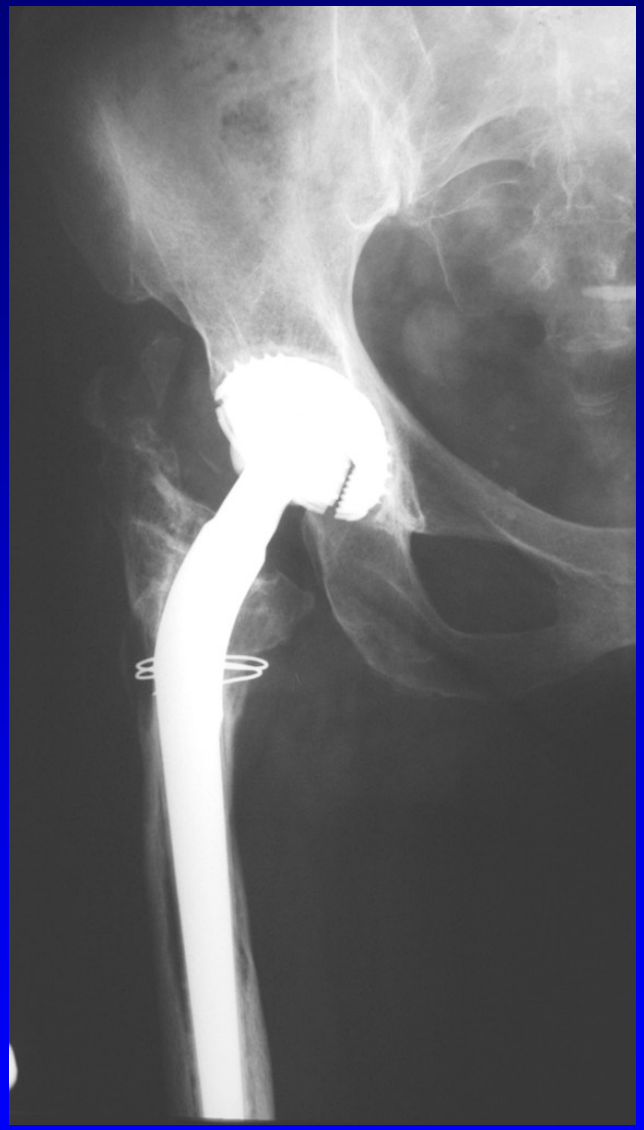
To start treatment as soon as possible:
10-14 days from the onset of symptoms

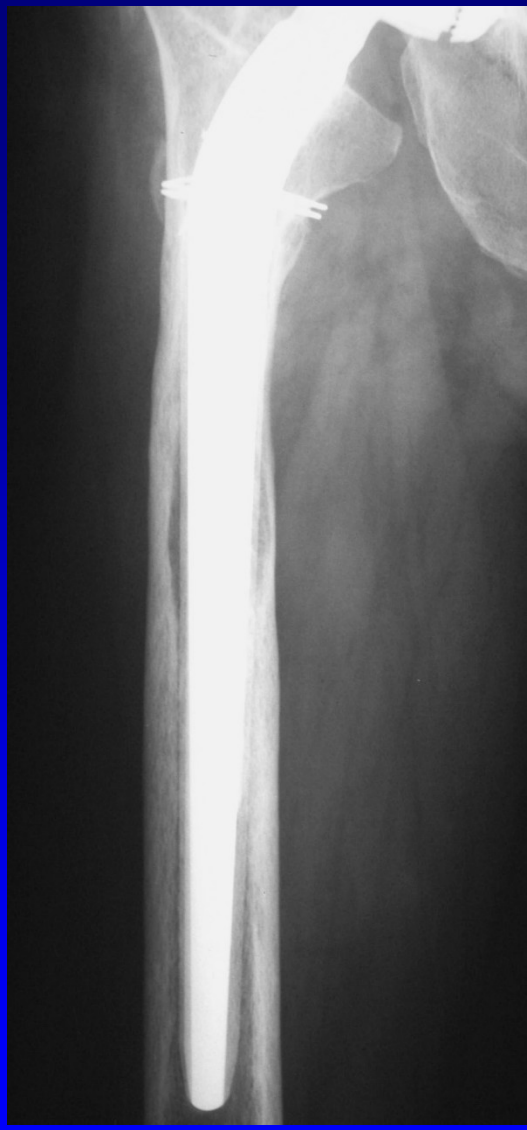
Prerequisity: cooperation of the patient

informed physician

Periprosthetic infection-treatment

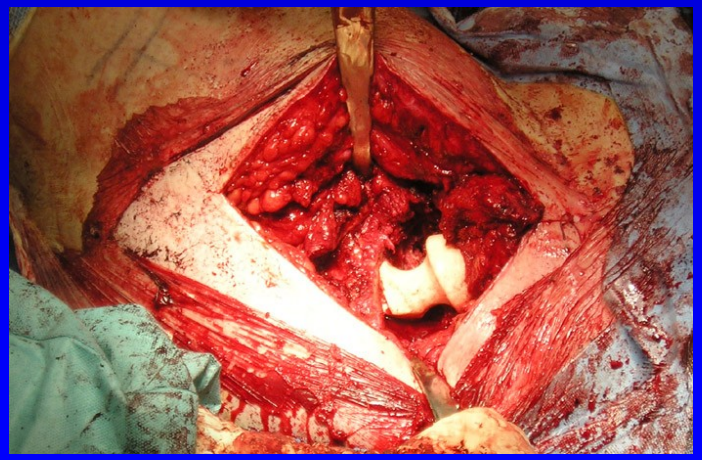
Debridement
One stage surgery
Two stage surgery
Resection artroplasty
Antibiotic suppresion





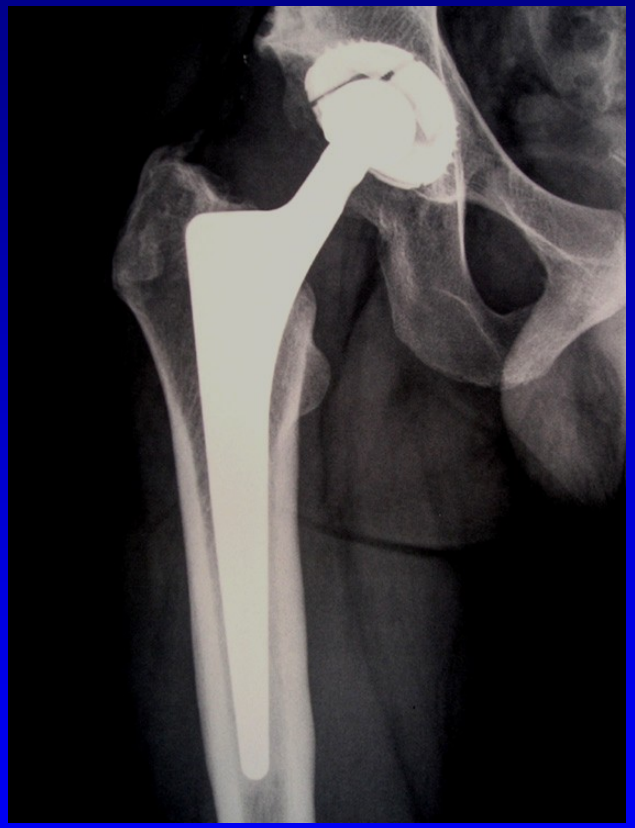
Hip spacers

Two stage surgery
Better ROM
Better walking
Revision is easier
Local concentration of antibiotics
- Gentamycin a Vancomycin
- Cover 90 % of all pathogens



Principles

Experience of the hospital
Long term results
National registries
Operative technique
Reliable implants
Activity of the patient
Regular follow up



Prerequisity for good result

Choise of the patient
Preop. examination
Prevention of infection
Choise of the implant
Operative technique
Postop. management
Activity of the patient
Regular follow- up
Prevetion of infection
Prevention of aseptic loosening

Daily activity after THA

No lifting and wearing of heavy objects
No strenuous manual labor
Limited running and jumping
No contact sports

Recommeded sports:
swimming, bicycle, tennis
tourism, skiing?
