

Class II. – modifications for amalgam

- Conventional preparation
- Slot
- Large cavities – replacement of the cusp (cusps), combination with the cavity on vestibular/oral surface

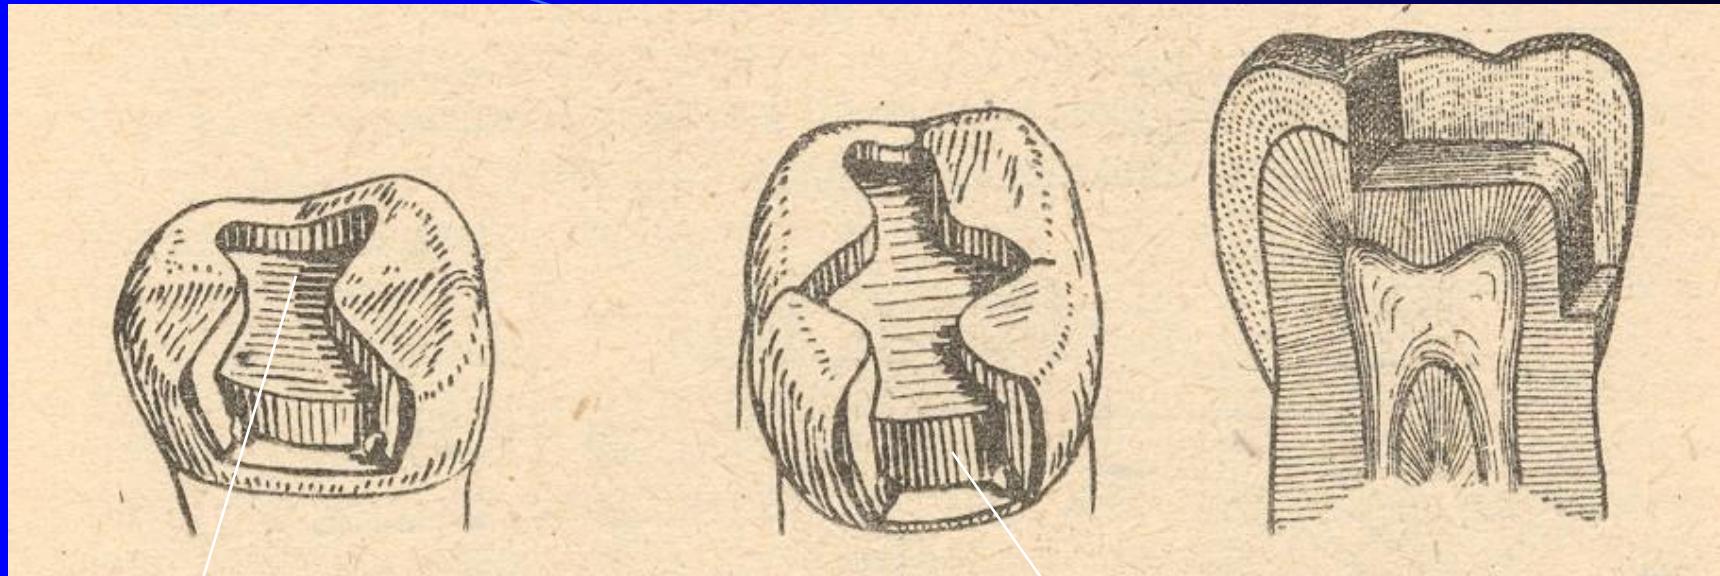

Class II.

Origin:

Proximal surface below the contact point

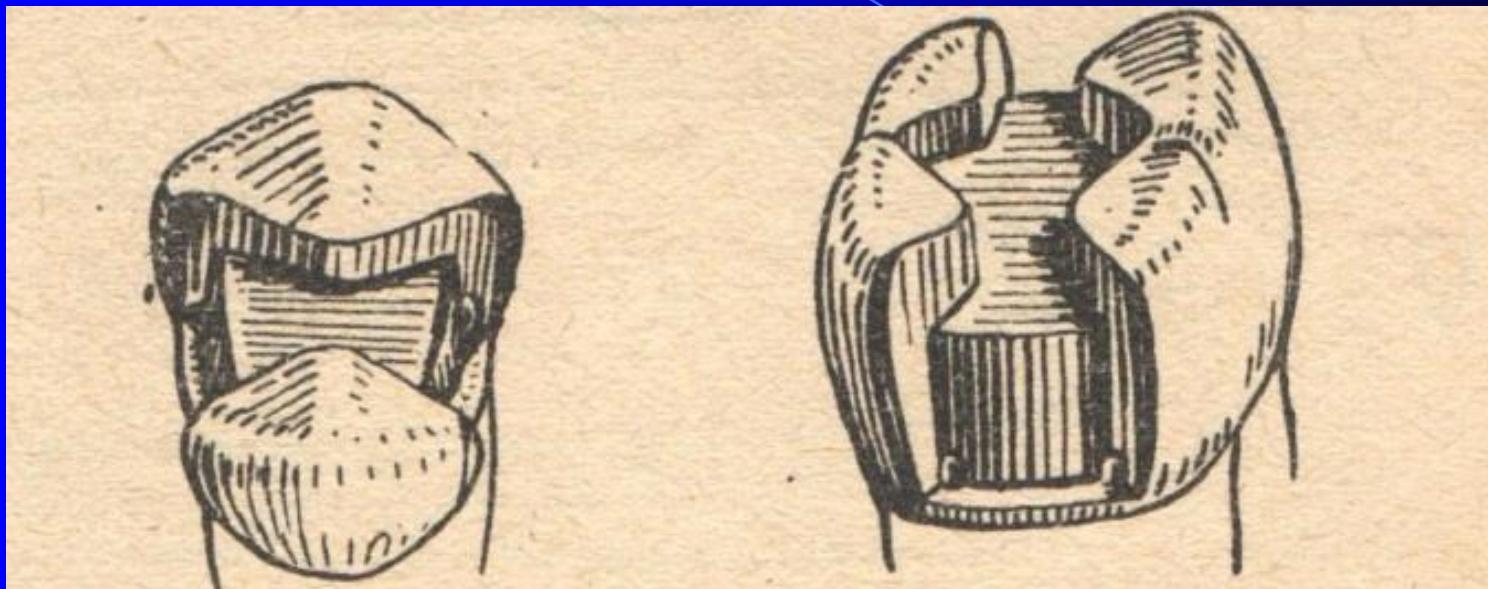

Propagation of dental caries from
the occlusal surface

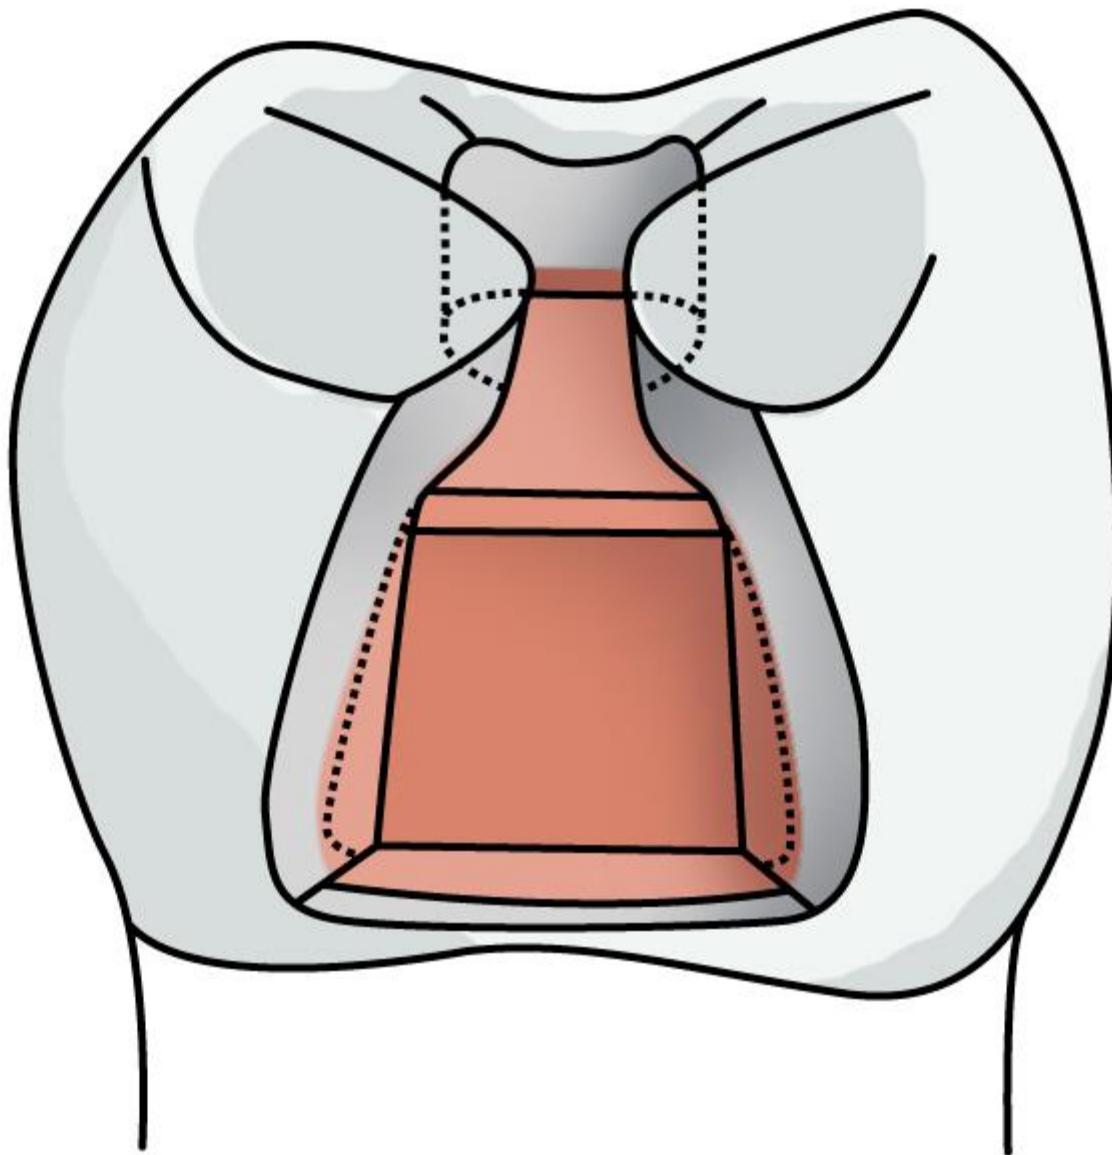

Occlusal cavity

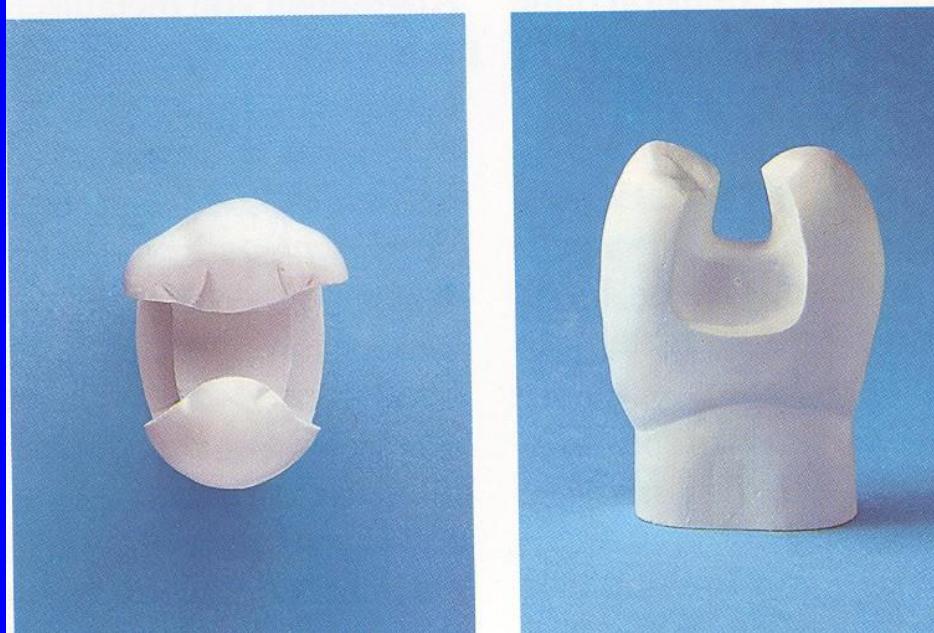

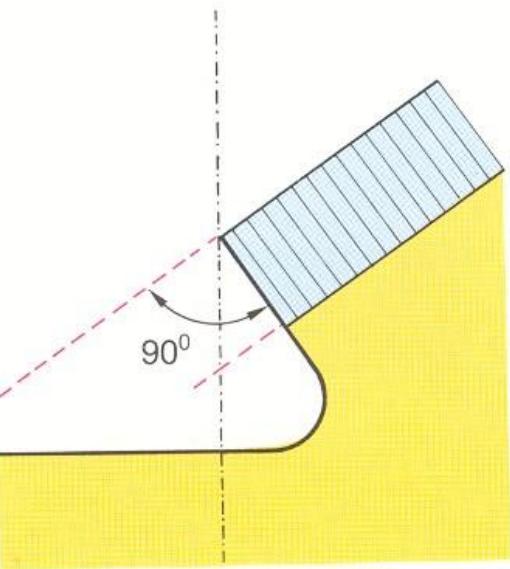

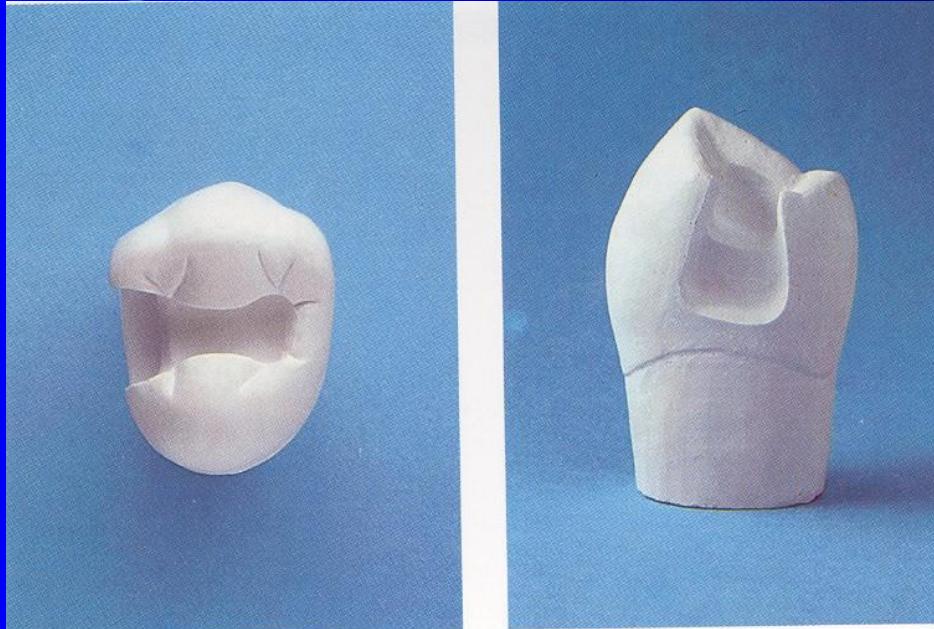

Proximal cavity

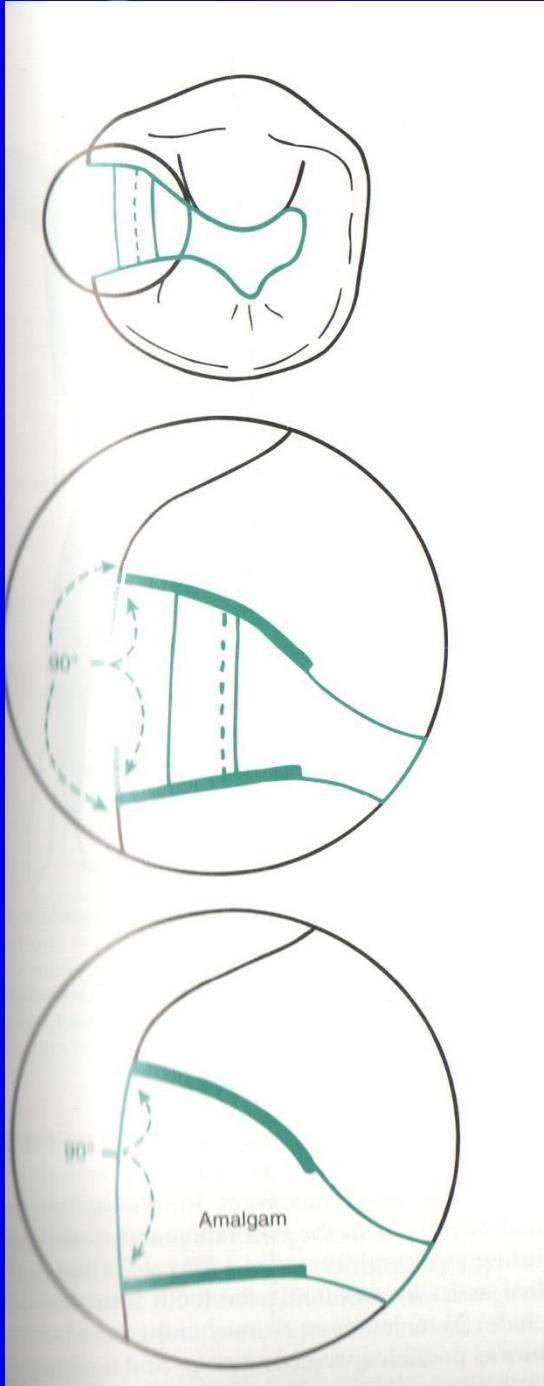

MOD

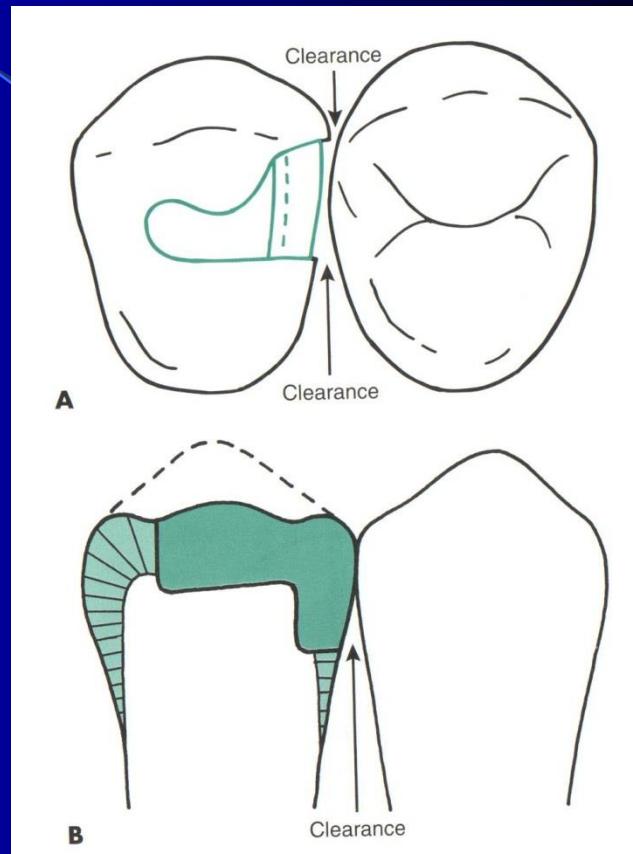

Cavosurface angle

Slight reverse curve

Clearence of the proximal surface

Matrix placement

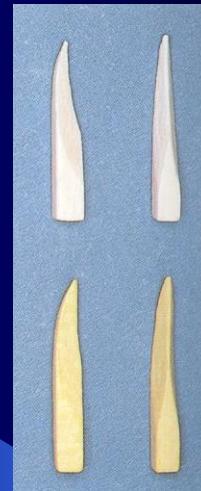

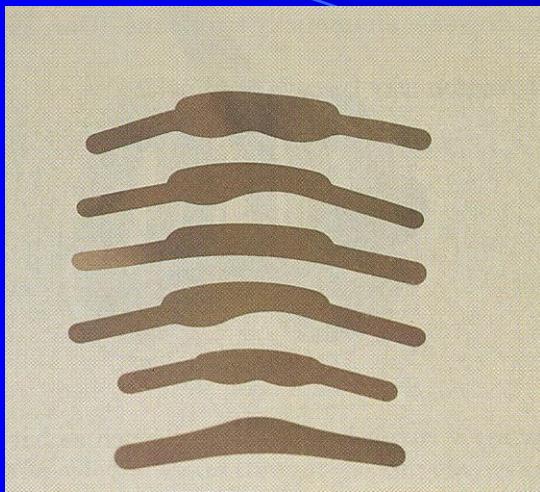

- Matrix primarily is used when a proximal surface is to be restored

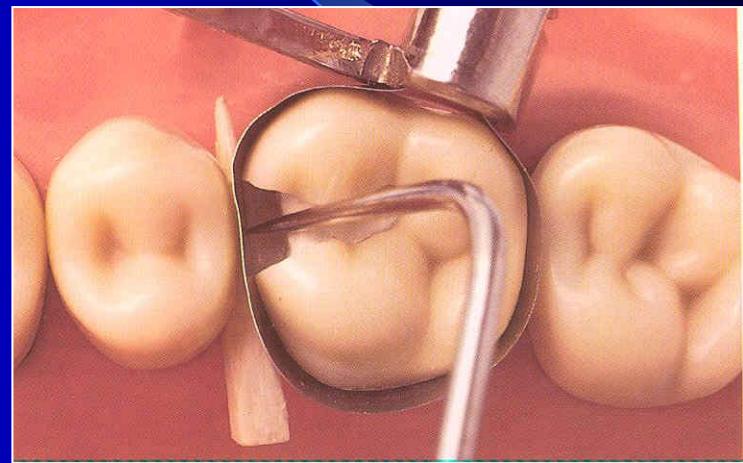

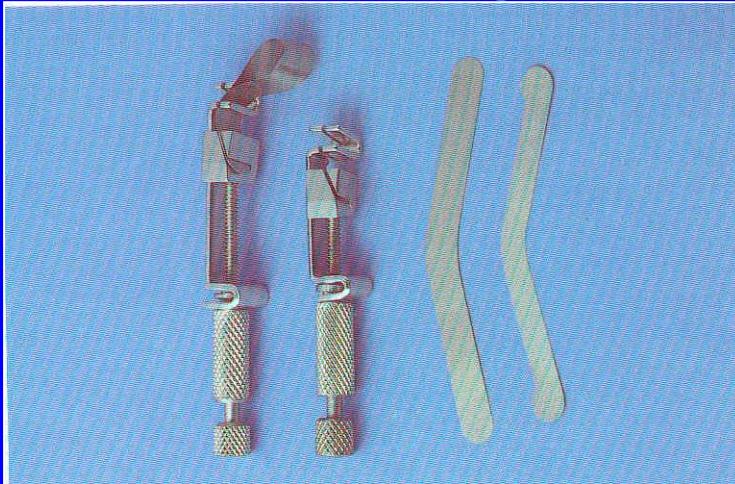

The objectives:

- Provide proper contact
- Provide proper contour
- Confine the restorative material
- Reduce the amount of excess material

Matrices

- Ivory I retainer Ivory 1
- Hawe Neos retainer Ivory 8
- Tofelmire matrix and retainer

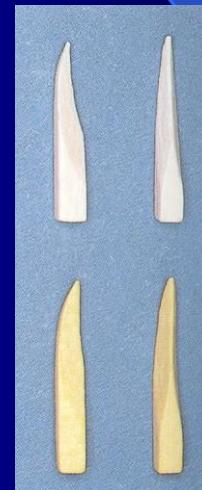

Wedges

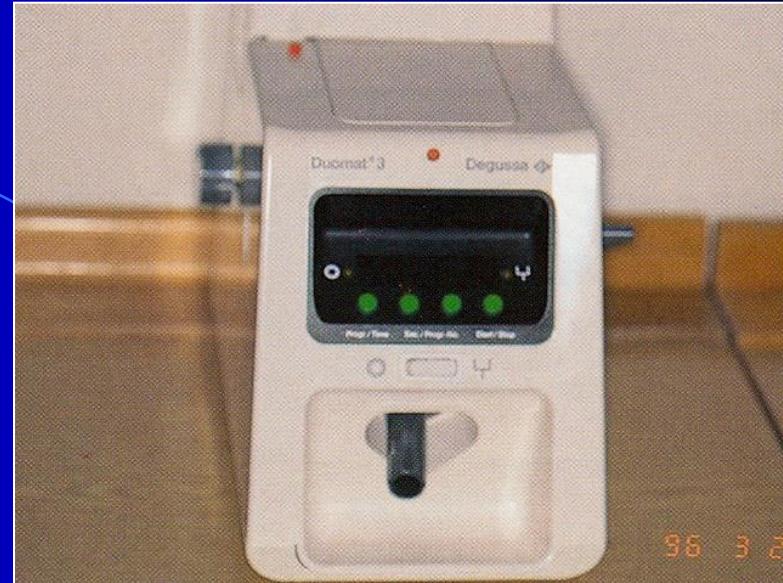

➤ Wooden wedges

- tighten the matrix band
- compress the gingiva
- separate the teeth

Wedging

- Slip the matrix band over the tooth
(apical to the gingiva margin – 0,5, - 1 mm)
- Tighten the matrix, check it with probe
- Place a wedge
- Turn the retainer $\frac{1}{4}$ counterclockwise
- Contour the band

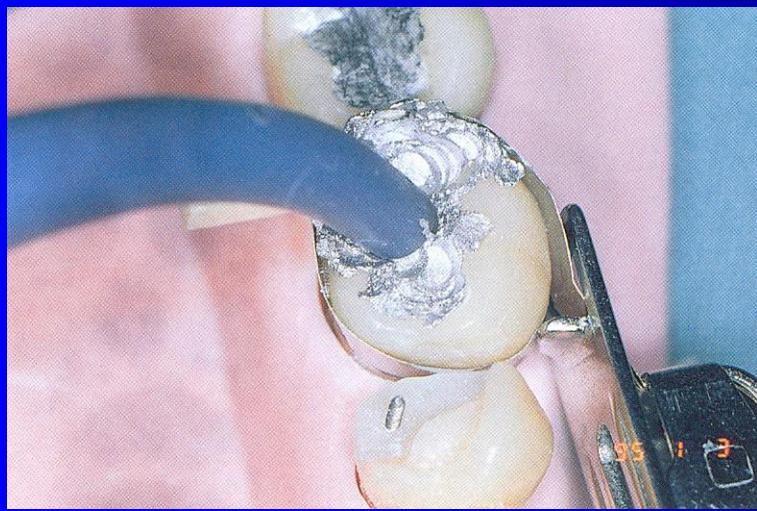

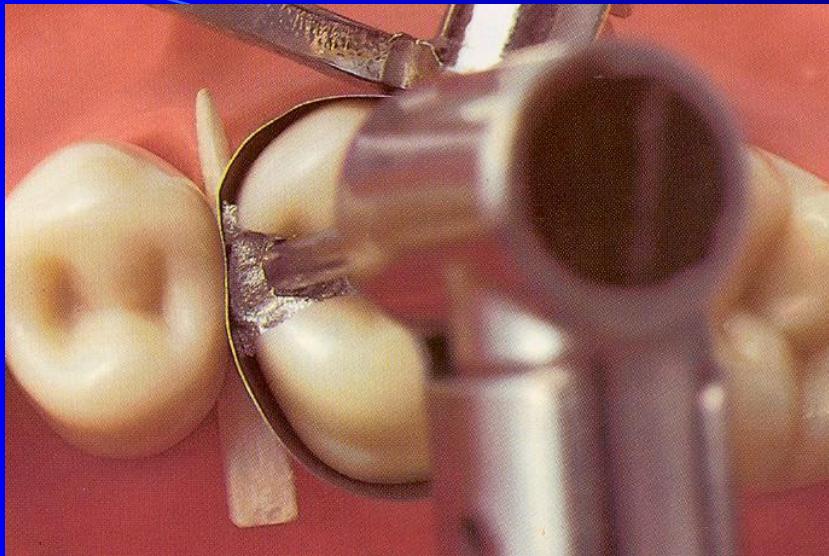

Amalgamators

Condensation of amalgam

- Condensor – with the straight front
- Power driven condensation

How big should the front be?

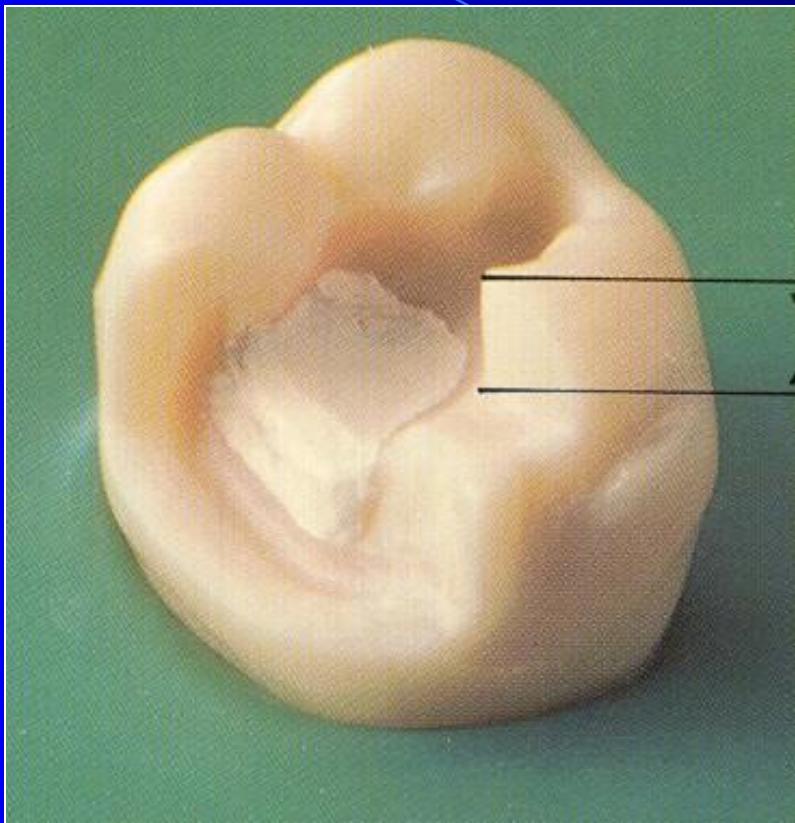

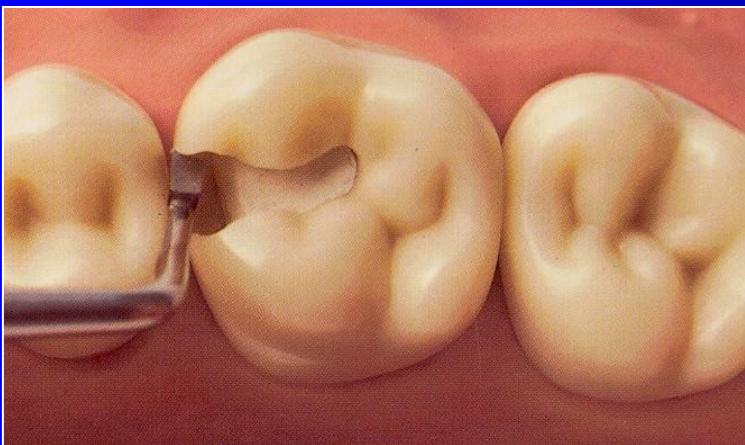

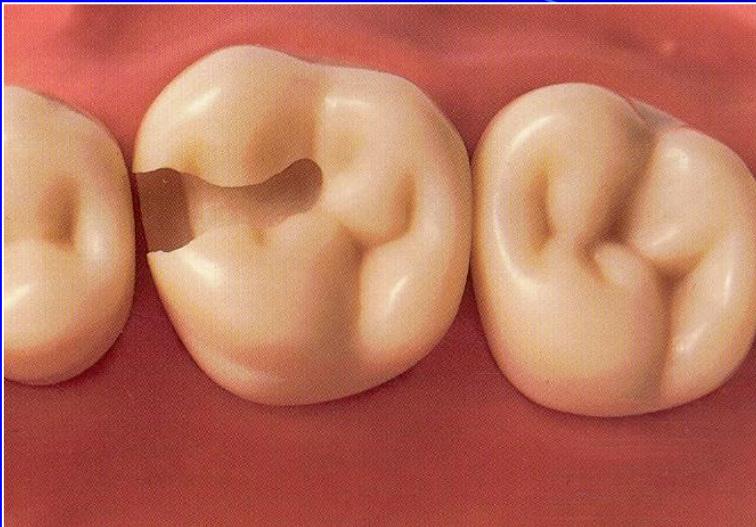

Base

- Zinkoxidphosphate cement
- Zinkoxidkarboxylate cement
- Glass ionomer cement
- Zinkoxideugenol

On pulpal walls only!

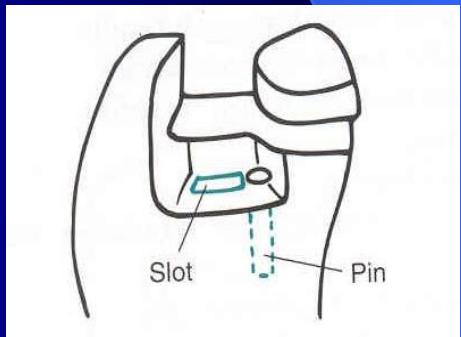

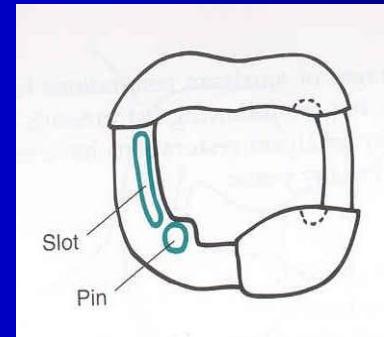

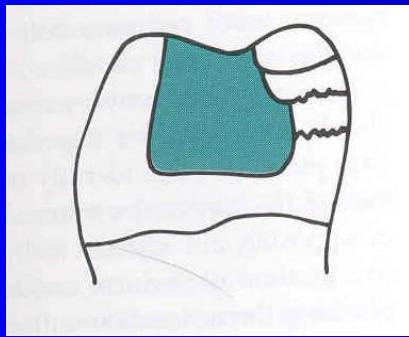

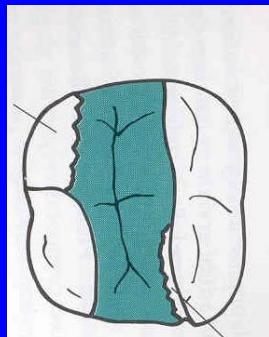

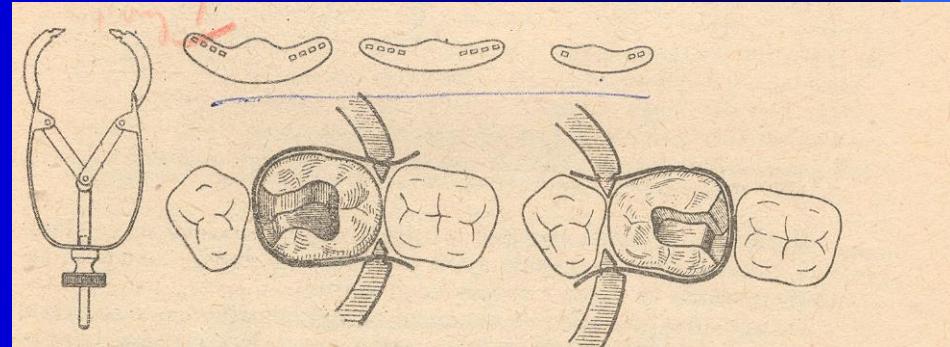

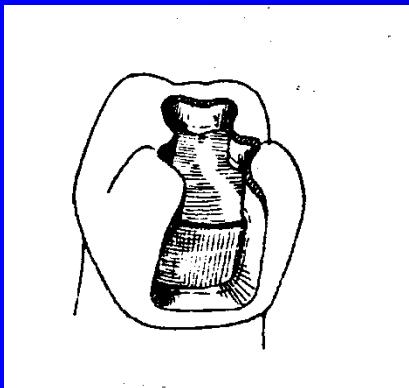

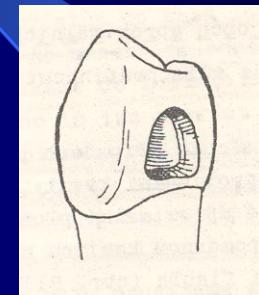

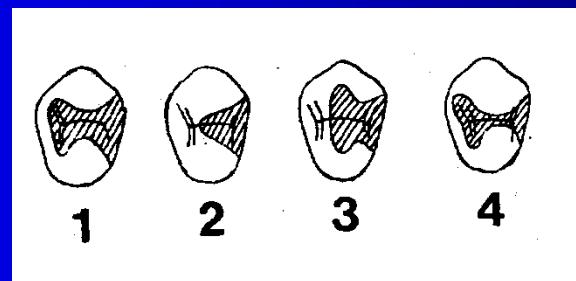

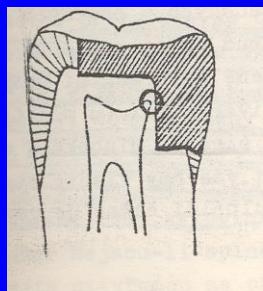

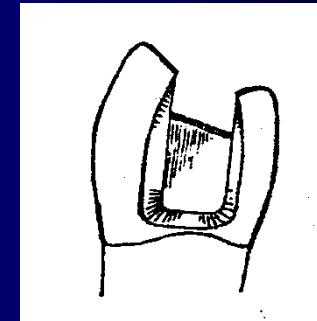

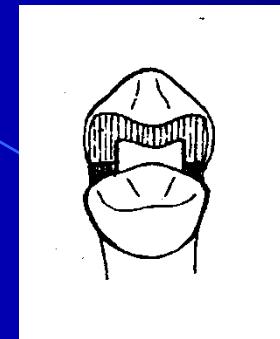

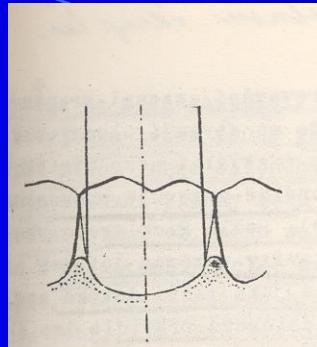

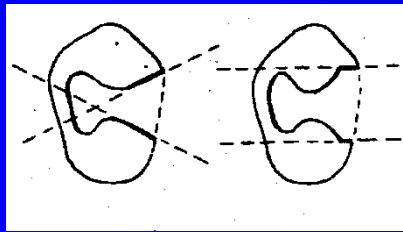

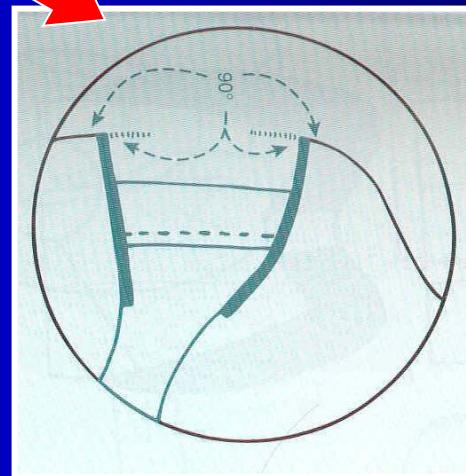

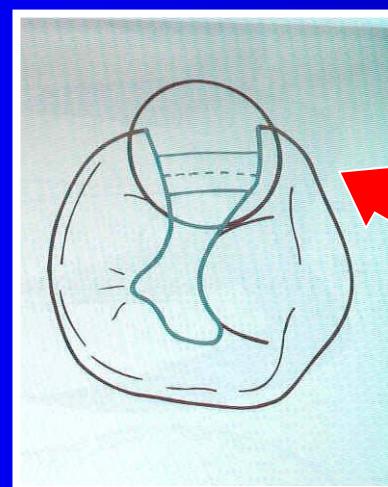

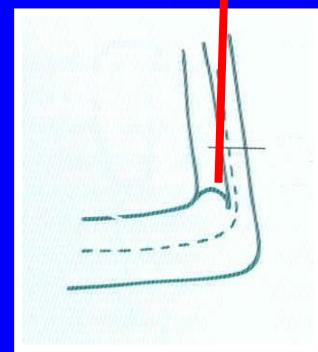

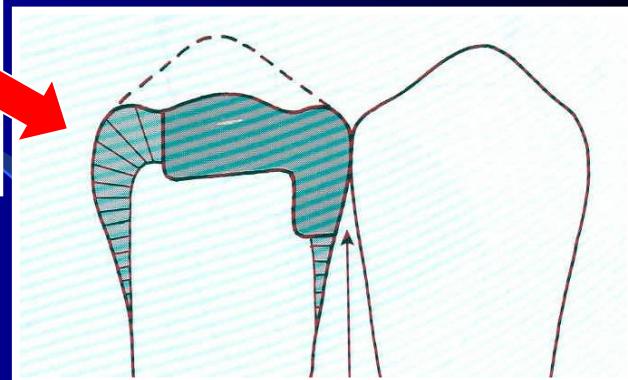

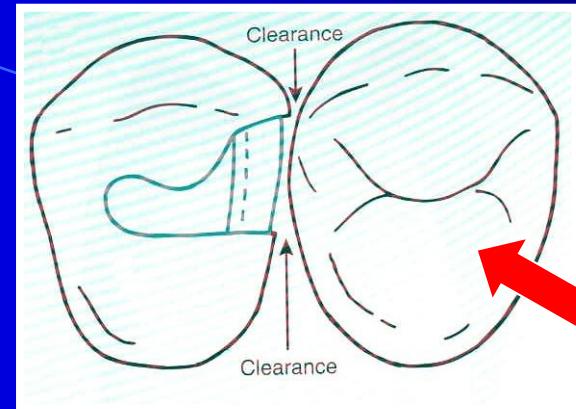

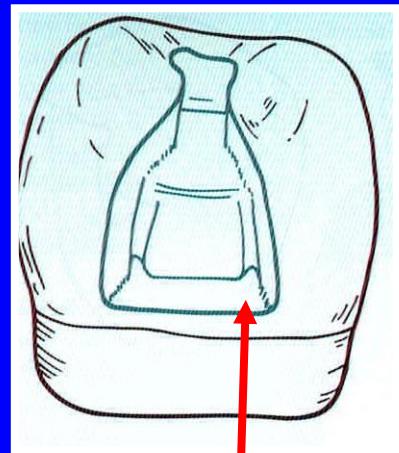

The base must be hardened

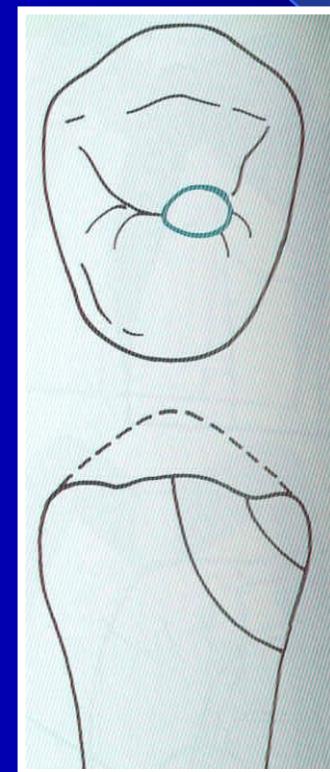

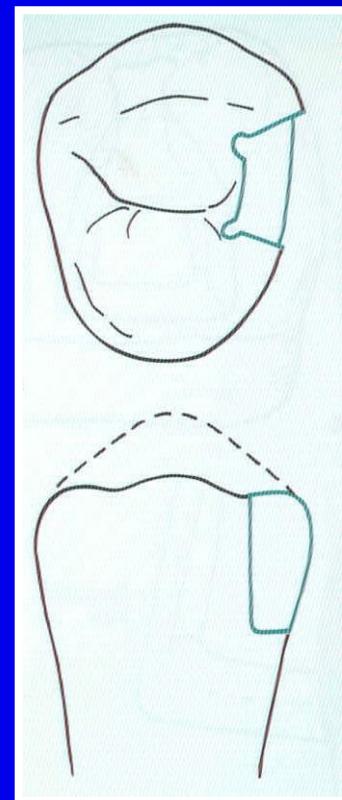

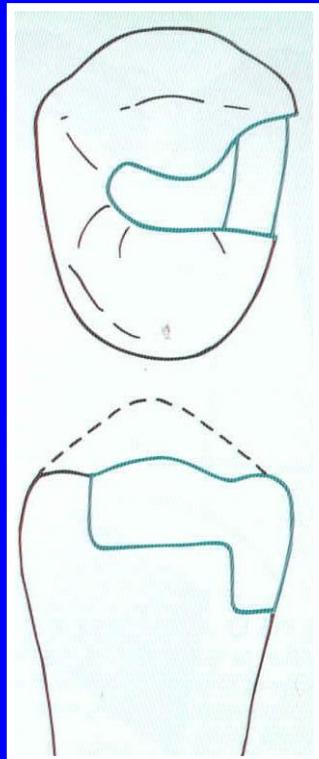

Amalgam

Retention

Instruments

- Preparation
- Filling
- Finishing and polishing

Cpátko tyčinkové

Ořezávač -Frahm

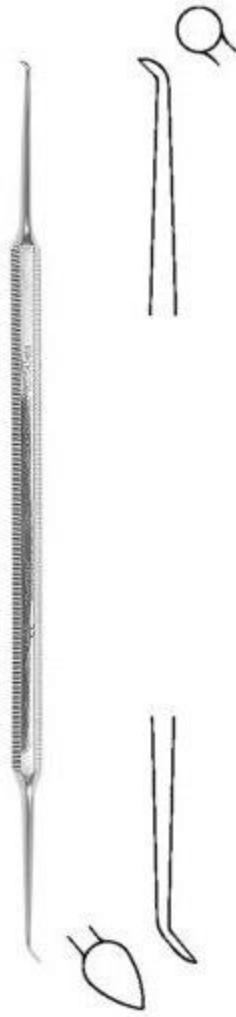

Sapin

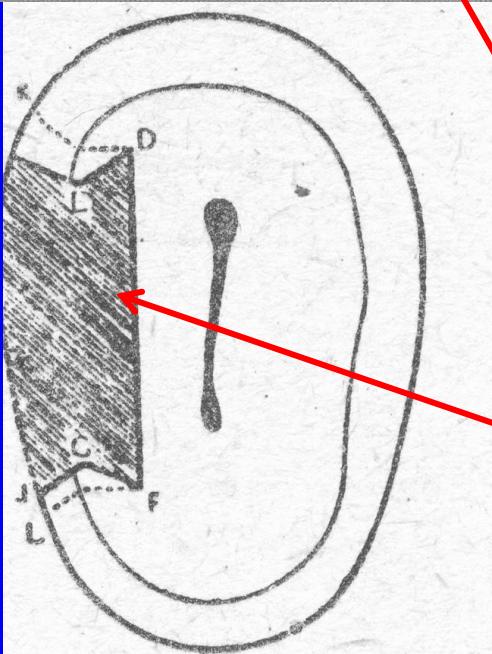

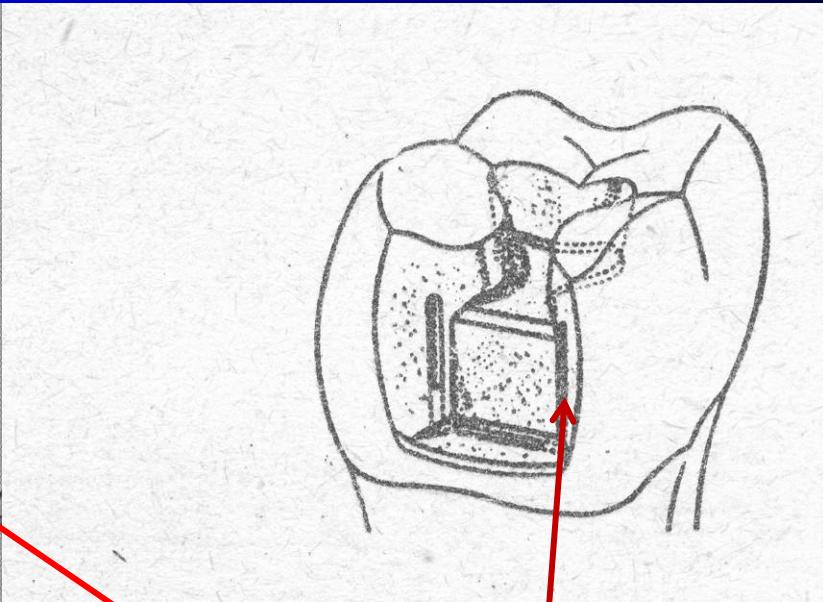

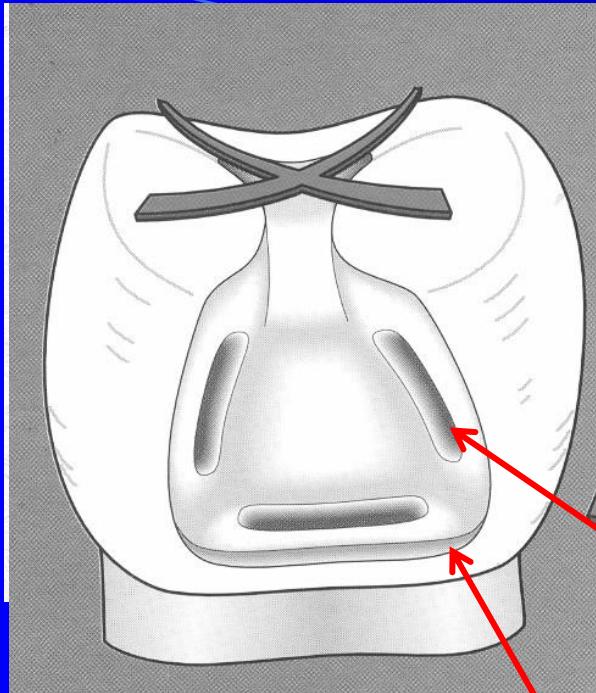

Discoid-cleoid

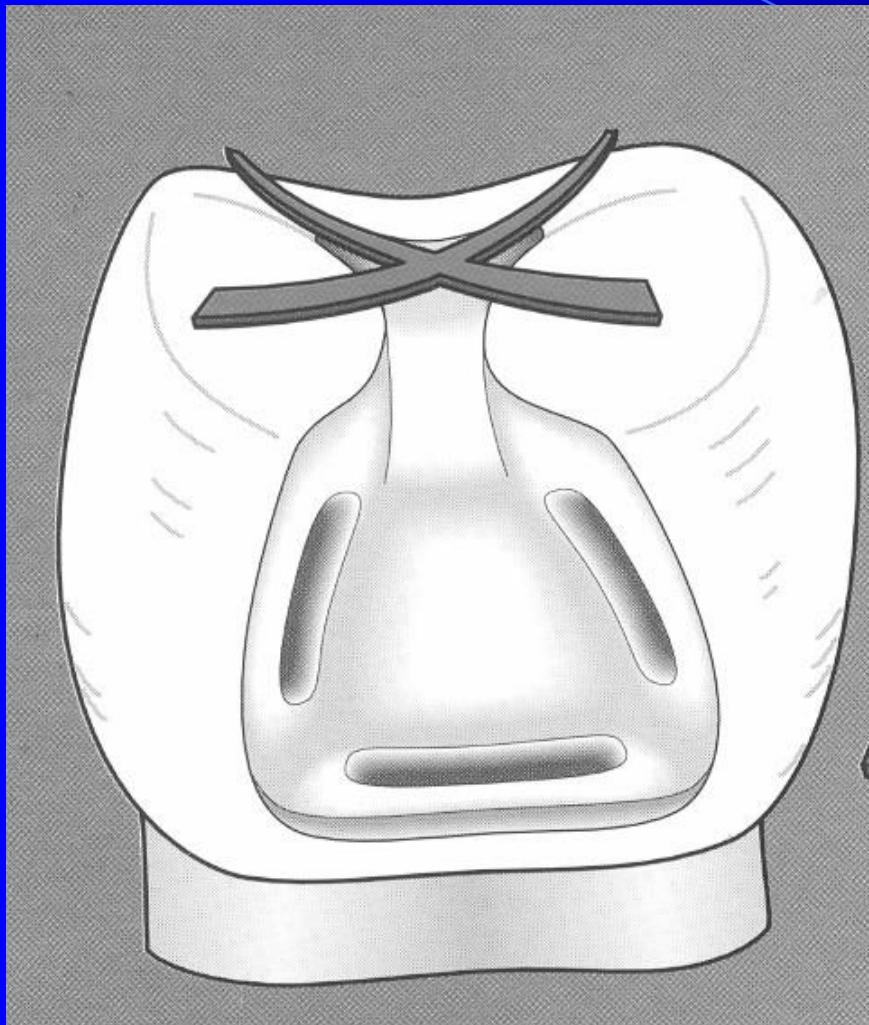

Amalgam carrier

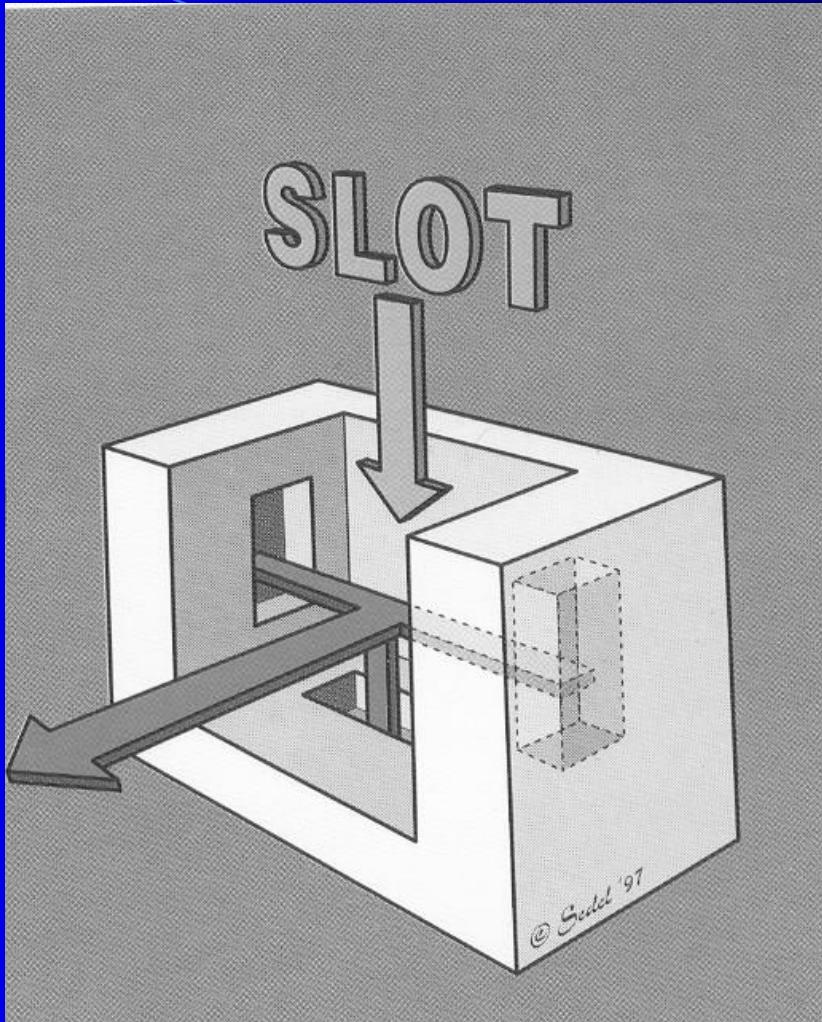

Retention – grooves
in the proximal cavity

Divergency of axial walls
towards gingiva and
Convergency - divergence
towards proximal space.

Autoretention

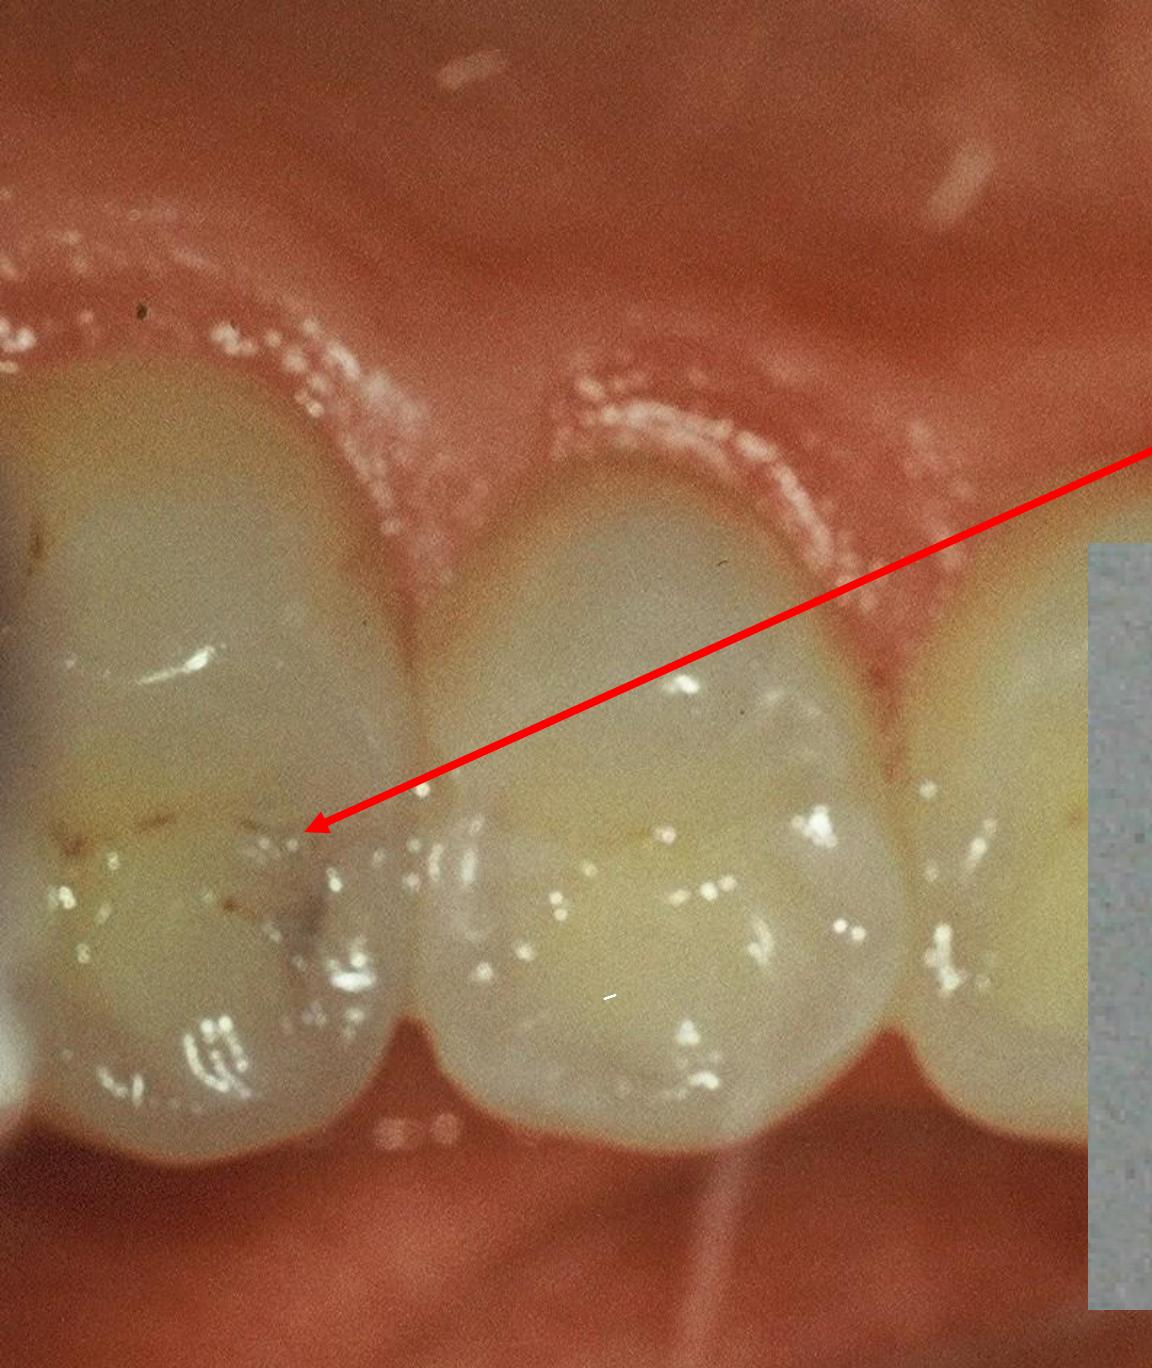

Slot preparation

Slot is a cavity that is open
on occlusal surface.
It is limited on the proximal ridge

Slot for amalgam

- Access to the caries lesion
 - through the enamel wall
 - breaking out of the enamel lamella
 - excavation of carious dentin

Pre op

Access to the cavity

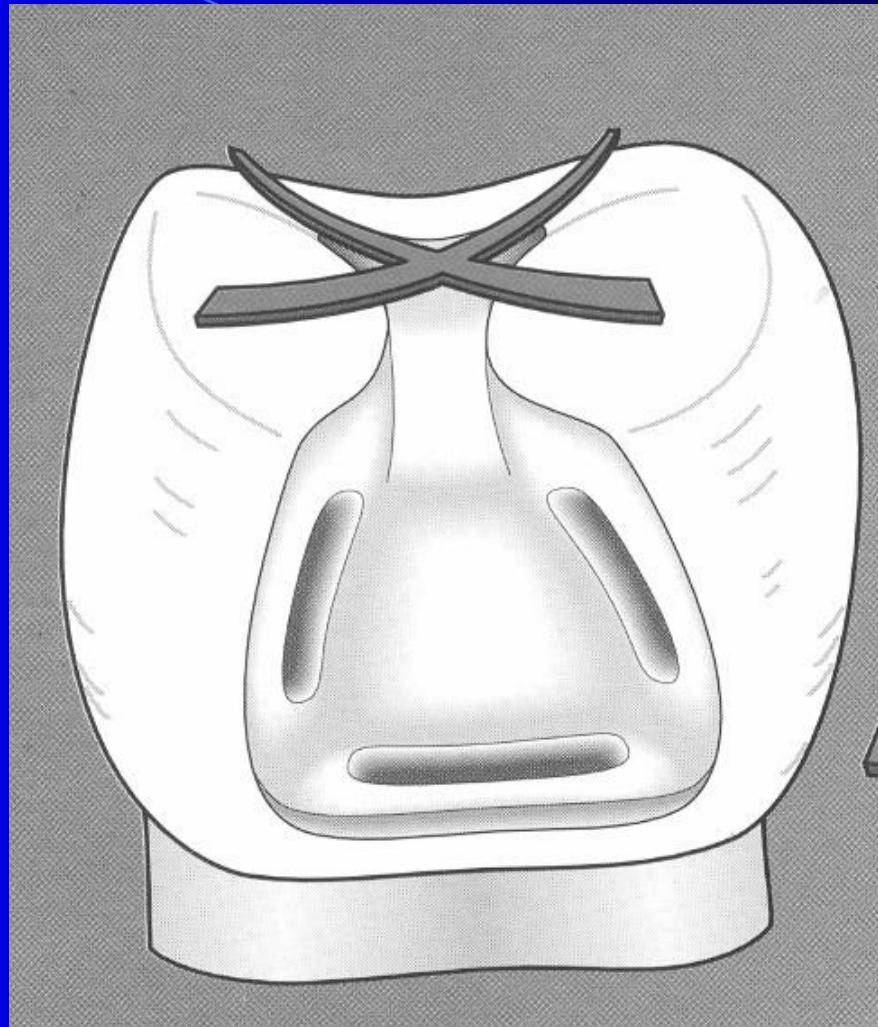

Slot for amalgam

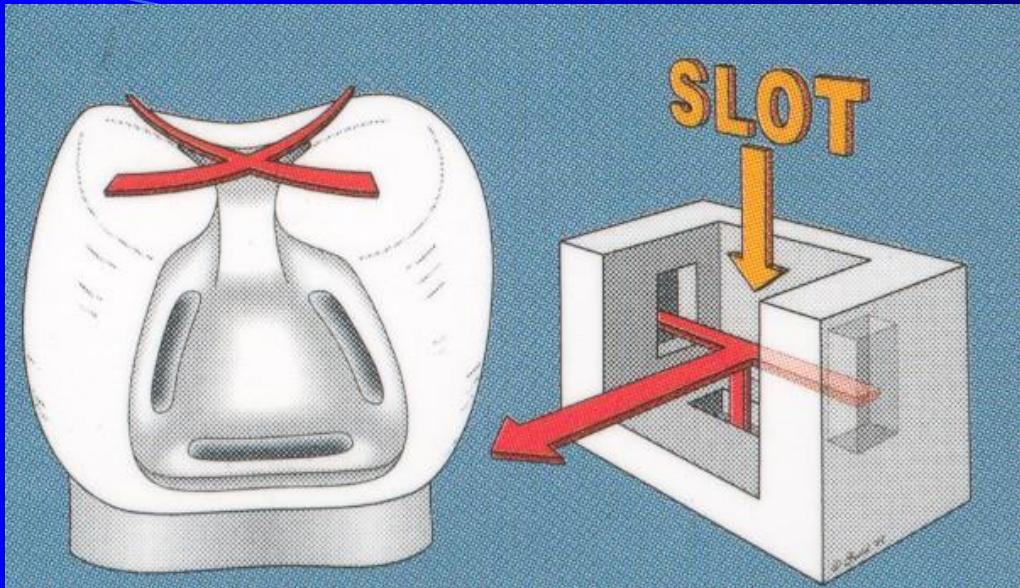

Autoretention

- Grooves
- Divergency towards gingiva
- Convergency and divergency of axial walls in horizontal plane(towards proximal space)

Slot for amalgam

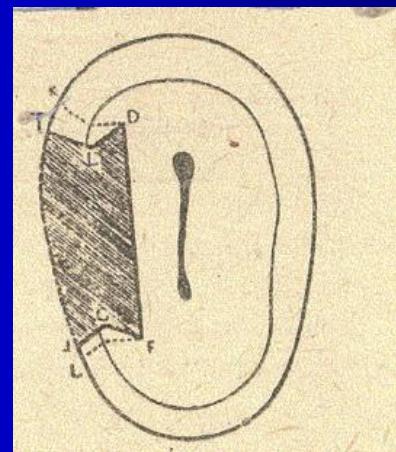

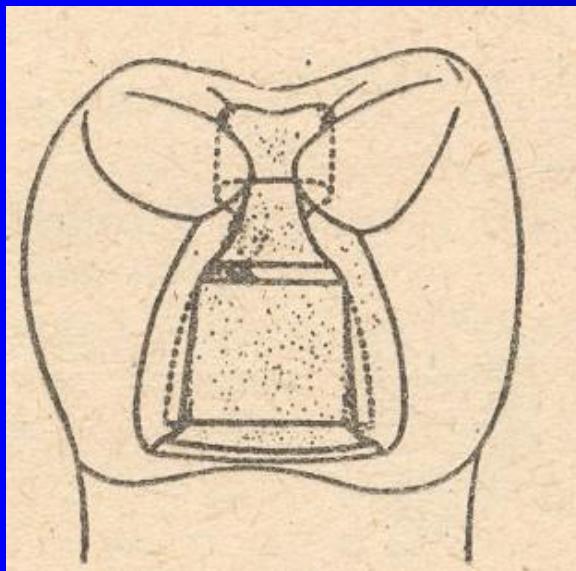

- Rule of the gingival wall
 - 1 mm wide
 - 90% angle towards the pulpal wall
 - outer line beveled if in enamel
 - horizontal groove

Sedelmayer

*Sedelmayer J. Amalgám – zapomenuté řemeslo.
Brno, 2000.*

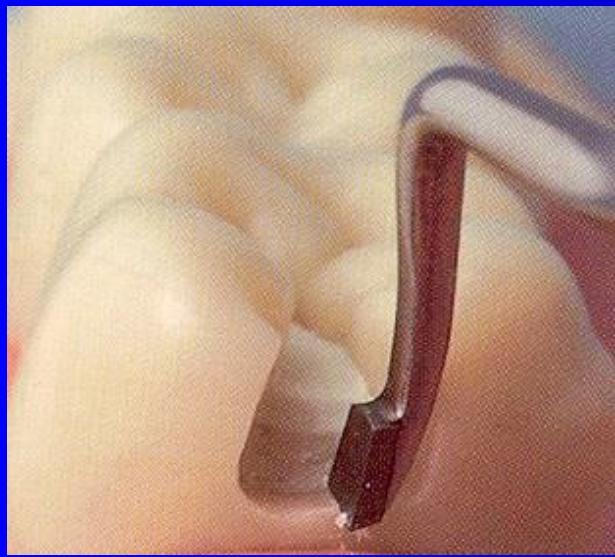

*Bažant V.
Konservační zubní lékařství, SPN Praha, 1962.*

Slot cavity

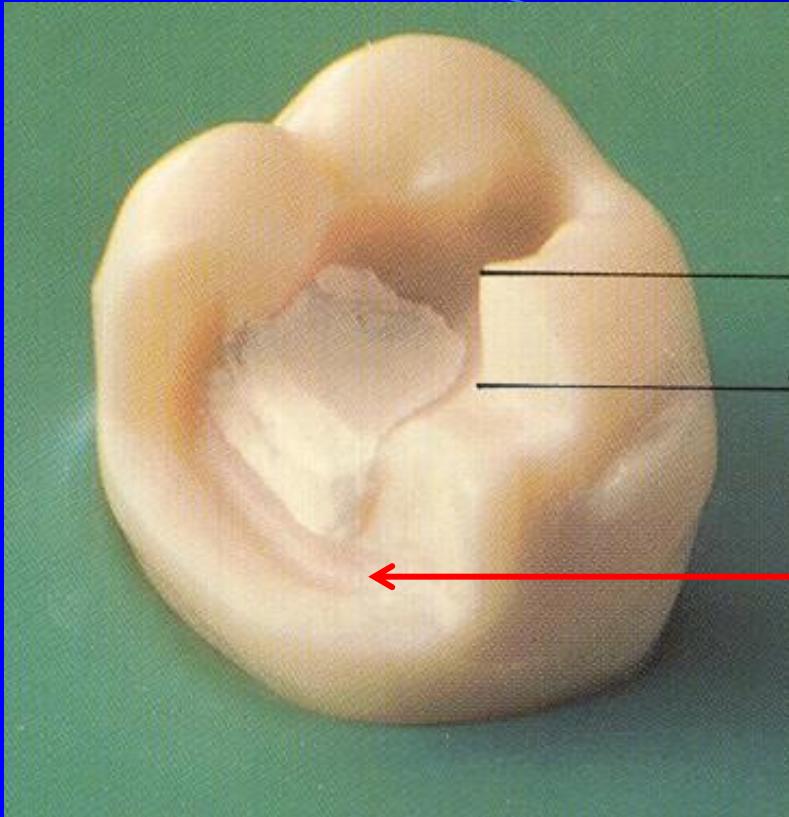

- Limited on proximal ridge
- Axial walls are divergent towards gingiva
- The proximal box has a typical picture of fish tail
- There are grooves:
 - One horizontal in gingival wall
 - Two vertical in axial walls

Large defects

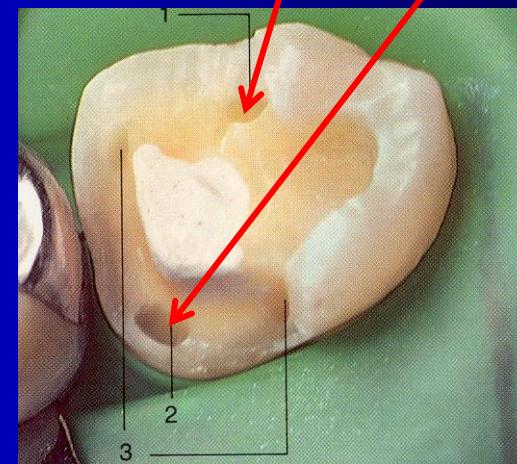

- In vital teeth if the cusp has been undermined due to dental caries
- Large defects in non vital teeth – amalgam overlays
- Combination with the cavity on vestibular/oral surface

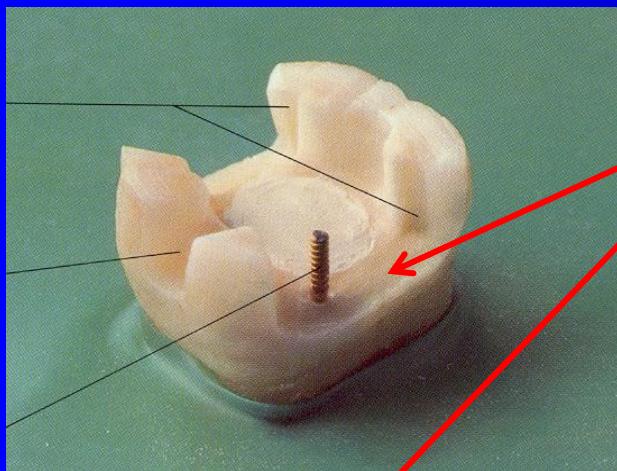

Cusp has been removed

The thickness of the filling
 $3 - 4 \text{ mm}$ (at the cusp)

Retention
Grooves, pins, slots

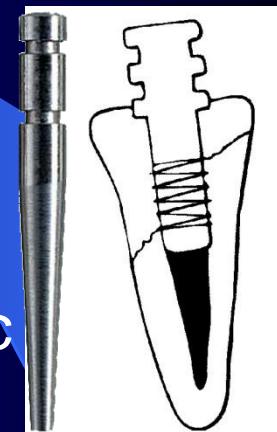

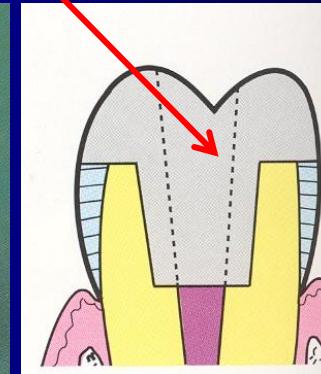

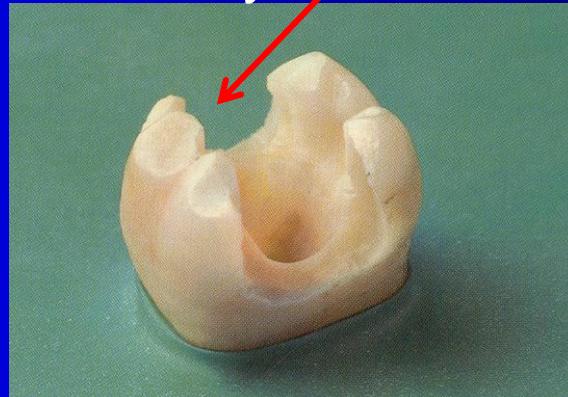

Parapulpal pins

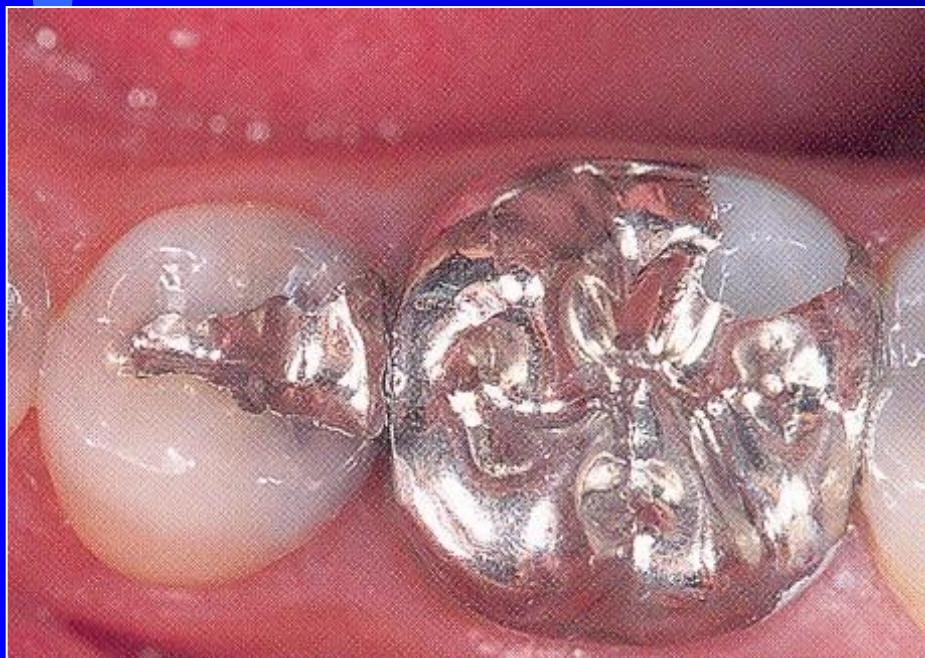

Intrapulpal posts (root canal posts)

Retention in the endodontic cavity

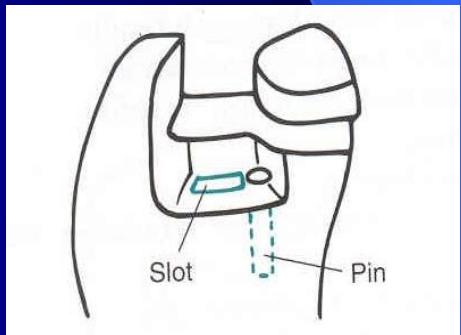

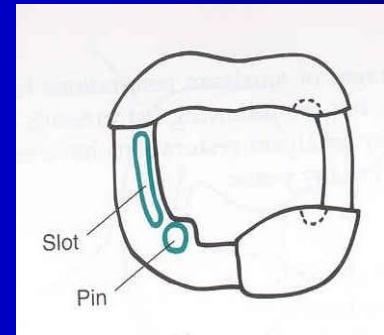

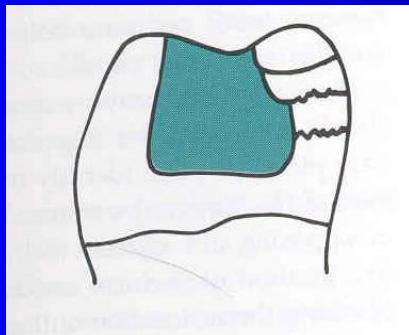

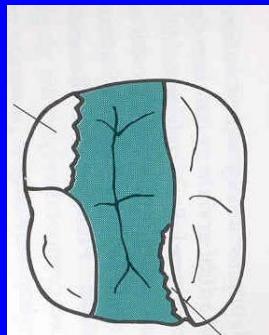

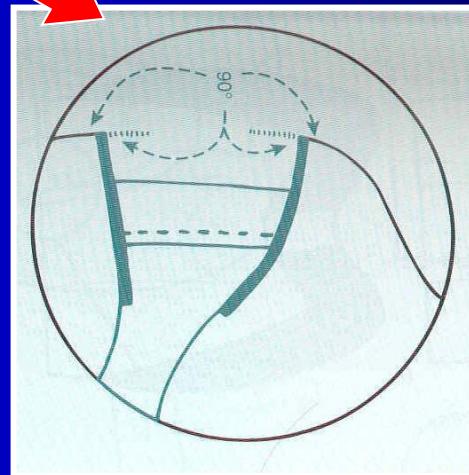

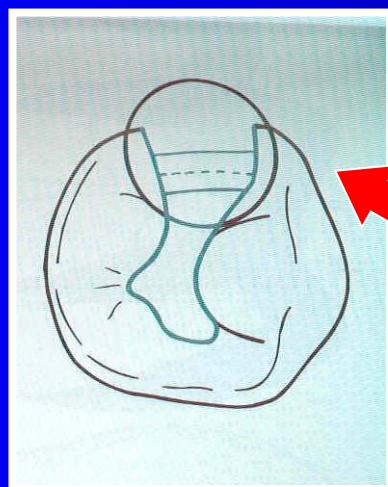

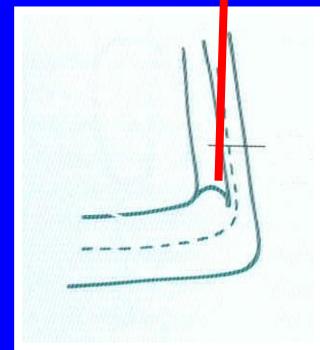

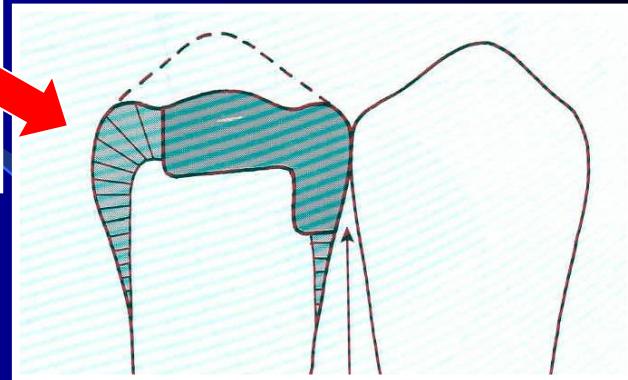

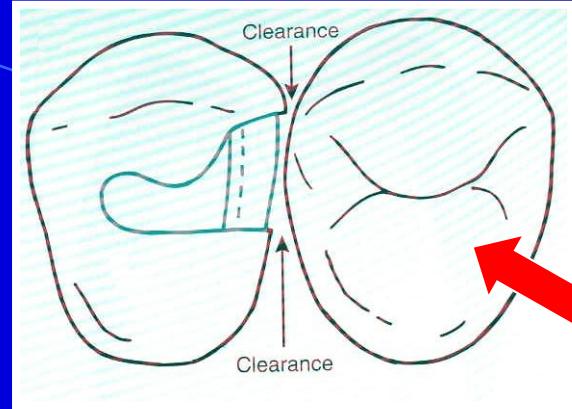

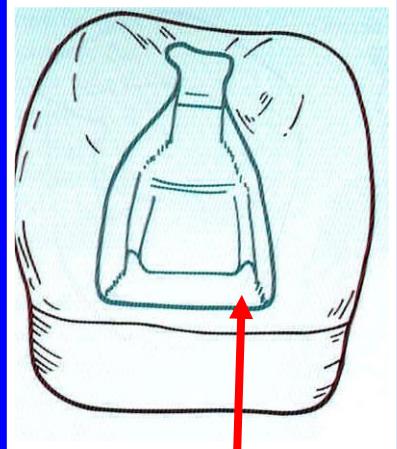

Large amalgam restoration - overlays

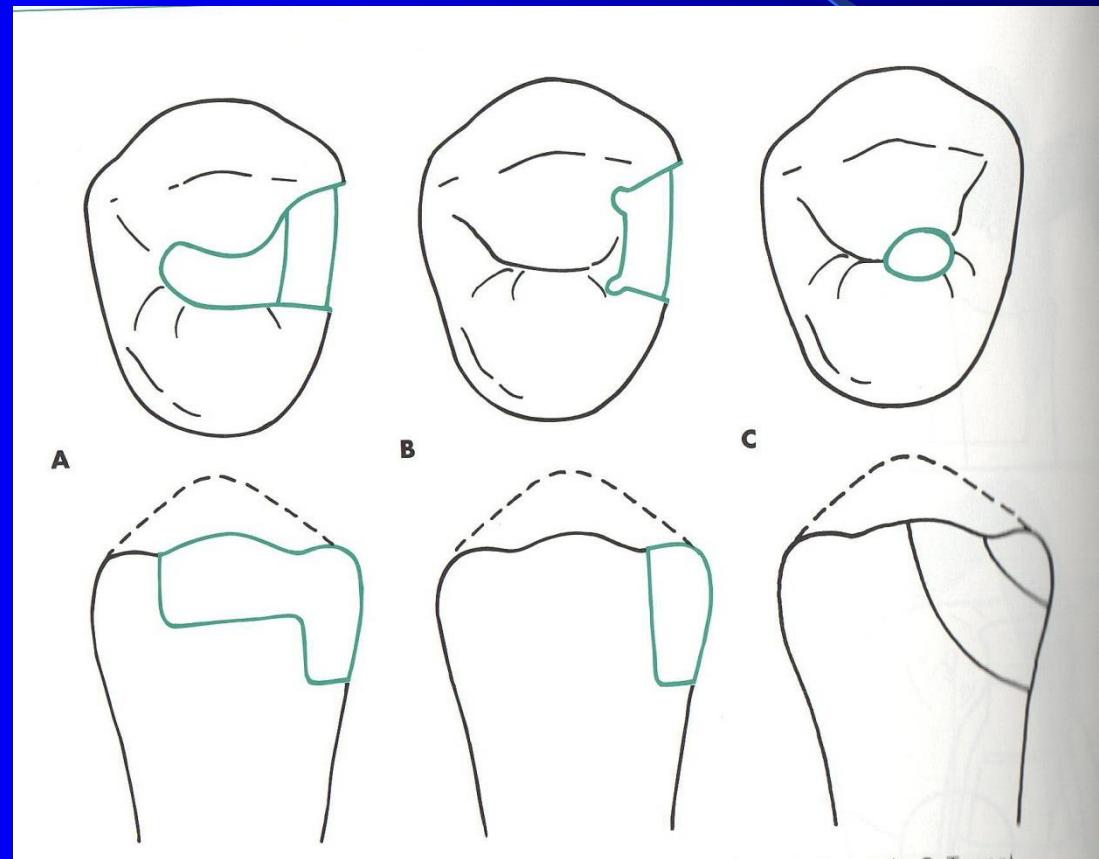

Amalgam

Exact work!

Basic modifications

Rules for large restorations

- Clear and sharp outlines – cavosurface margin

Thickness of the amalgam (the cusp 3 – 4 mm)

- Autoretention
 - Grooves
 - Pins, slots
 - Parapulpal pins
 - Intrapulpal posts – root canal posts

Resistance – acc to general rules

Composites - indication

- Small – moderate cavities
- Good level of oral hygiene
- No heavy occlusal stress
- Dry operating field

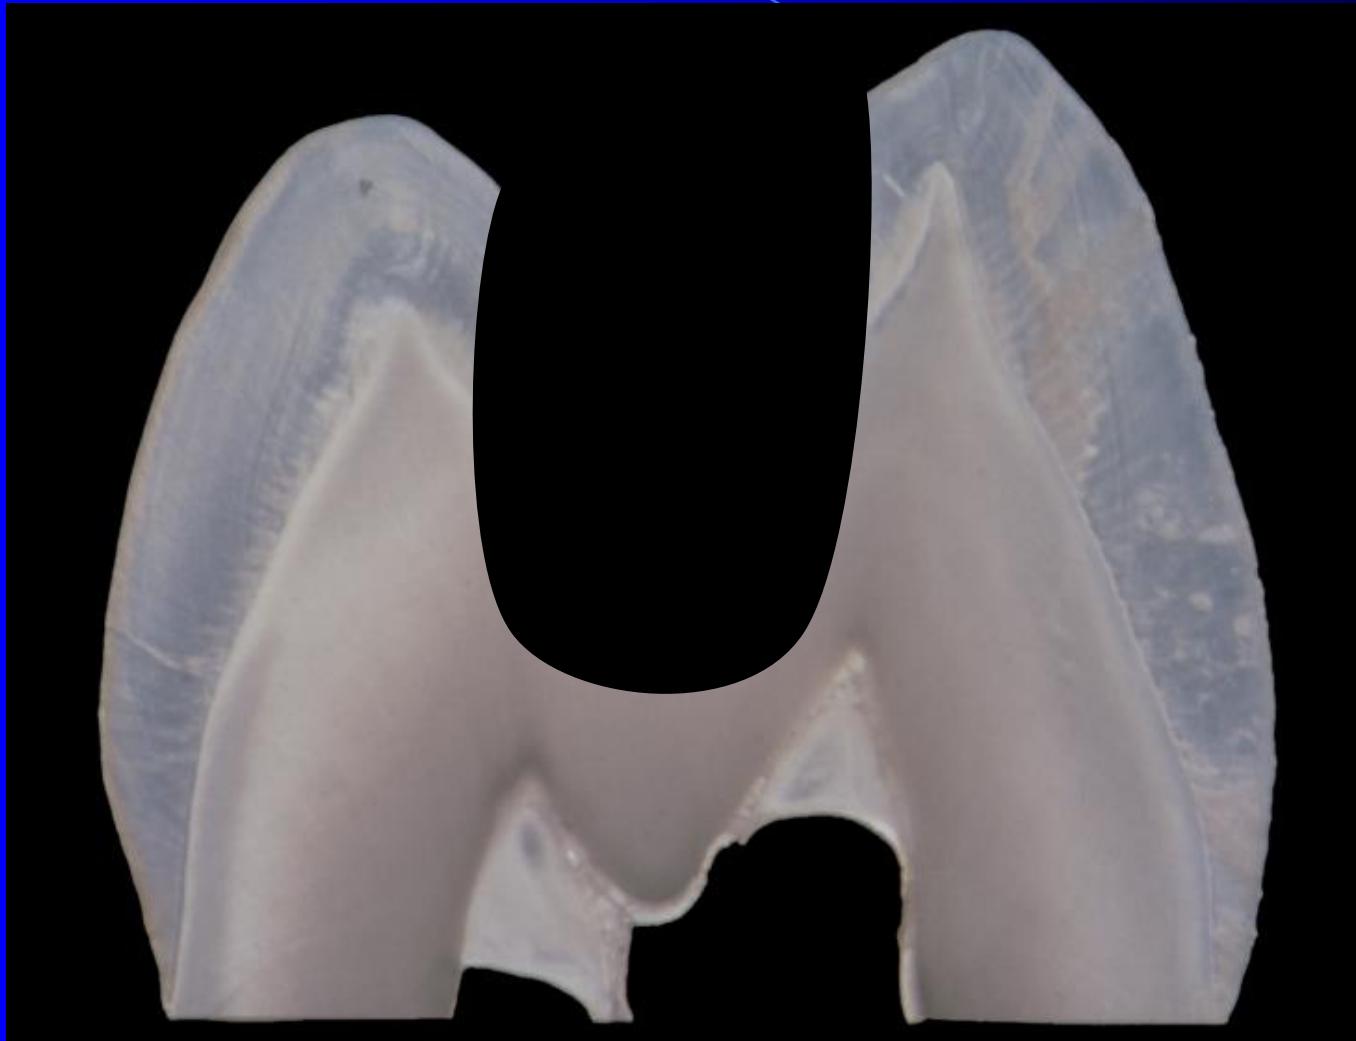

Preparation for adhesive materials – composites

- No extension for prevention (adhesion)
- No grooves
- No undercuts
- Rounded box
- Bevel the axial walls and the outer edge of the gingival wall
- Small isolated cavities are possible

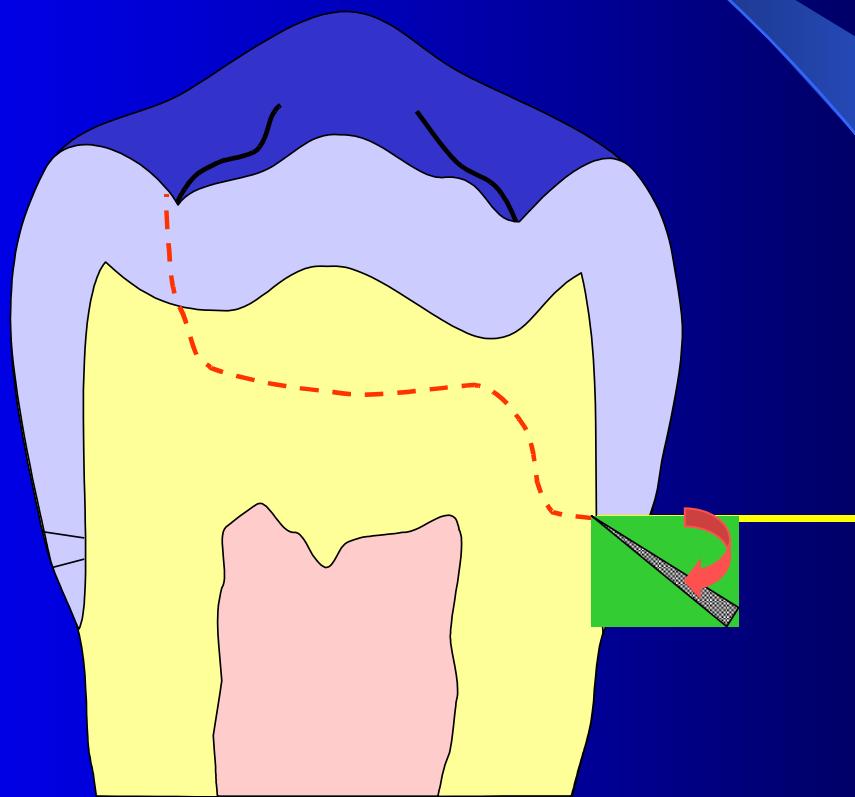

Cavity for amalgam

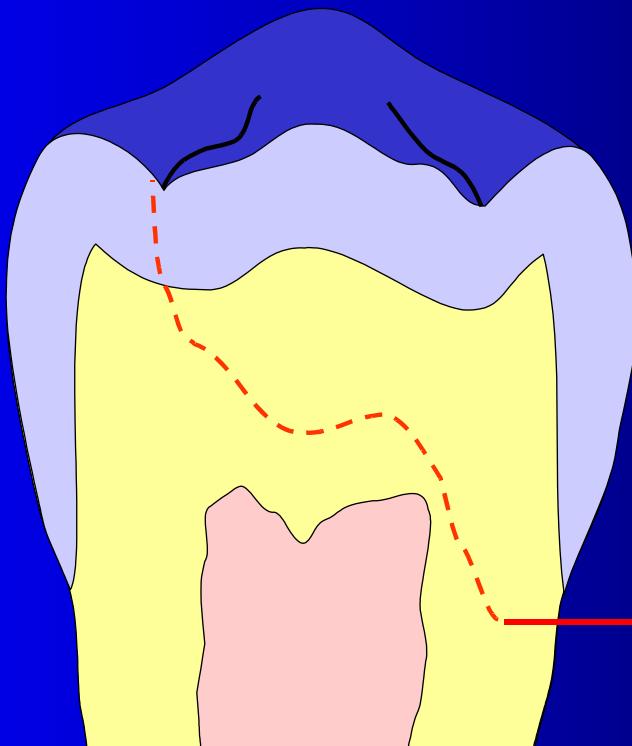

Cavity for composite

Bevel on the gingival wall

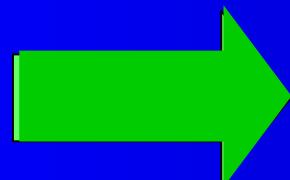

If out of enamel

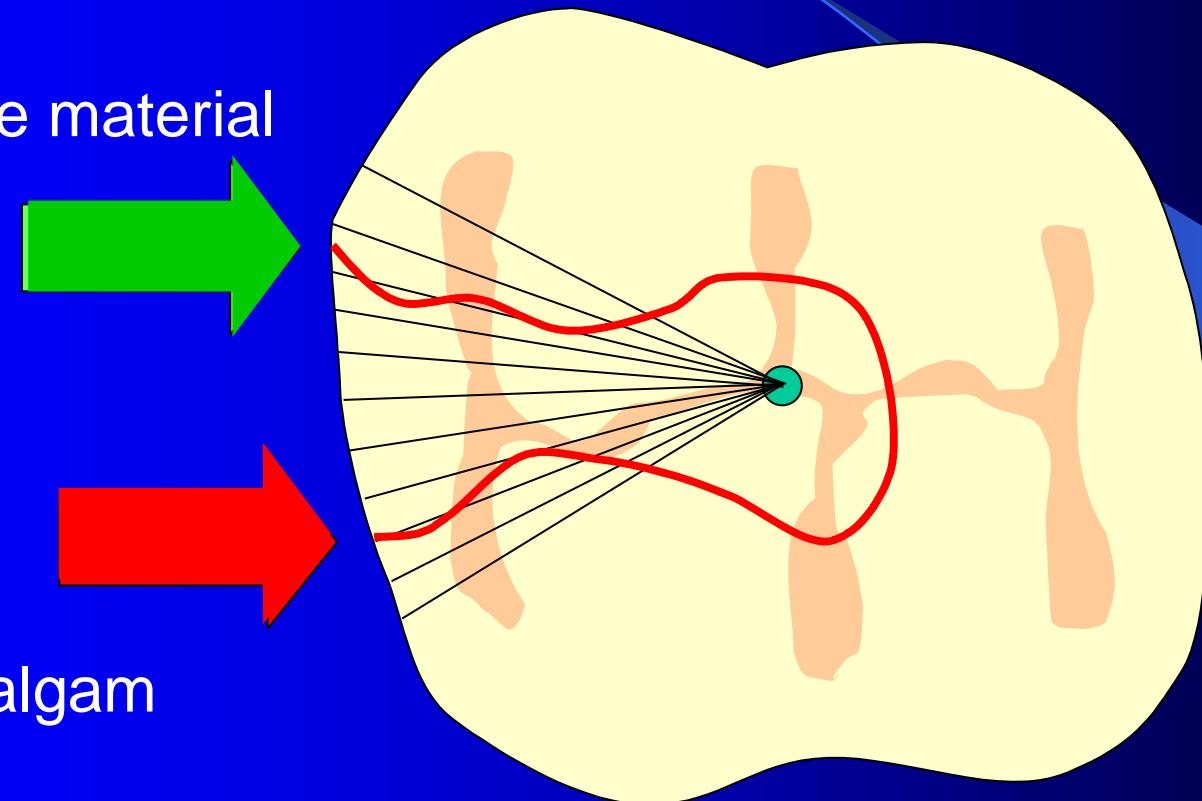

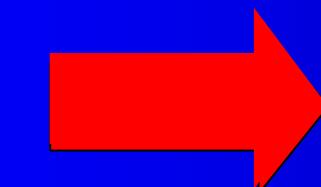

Preparation
do not bevel!!!

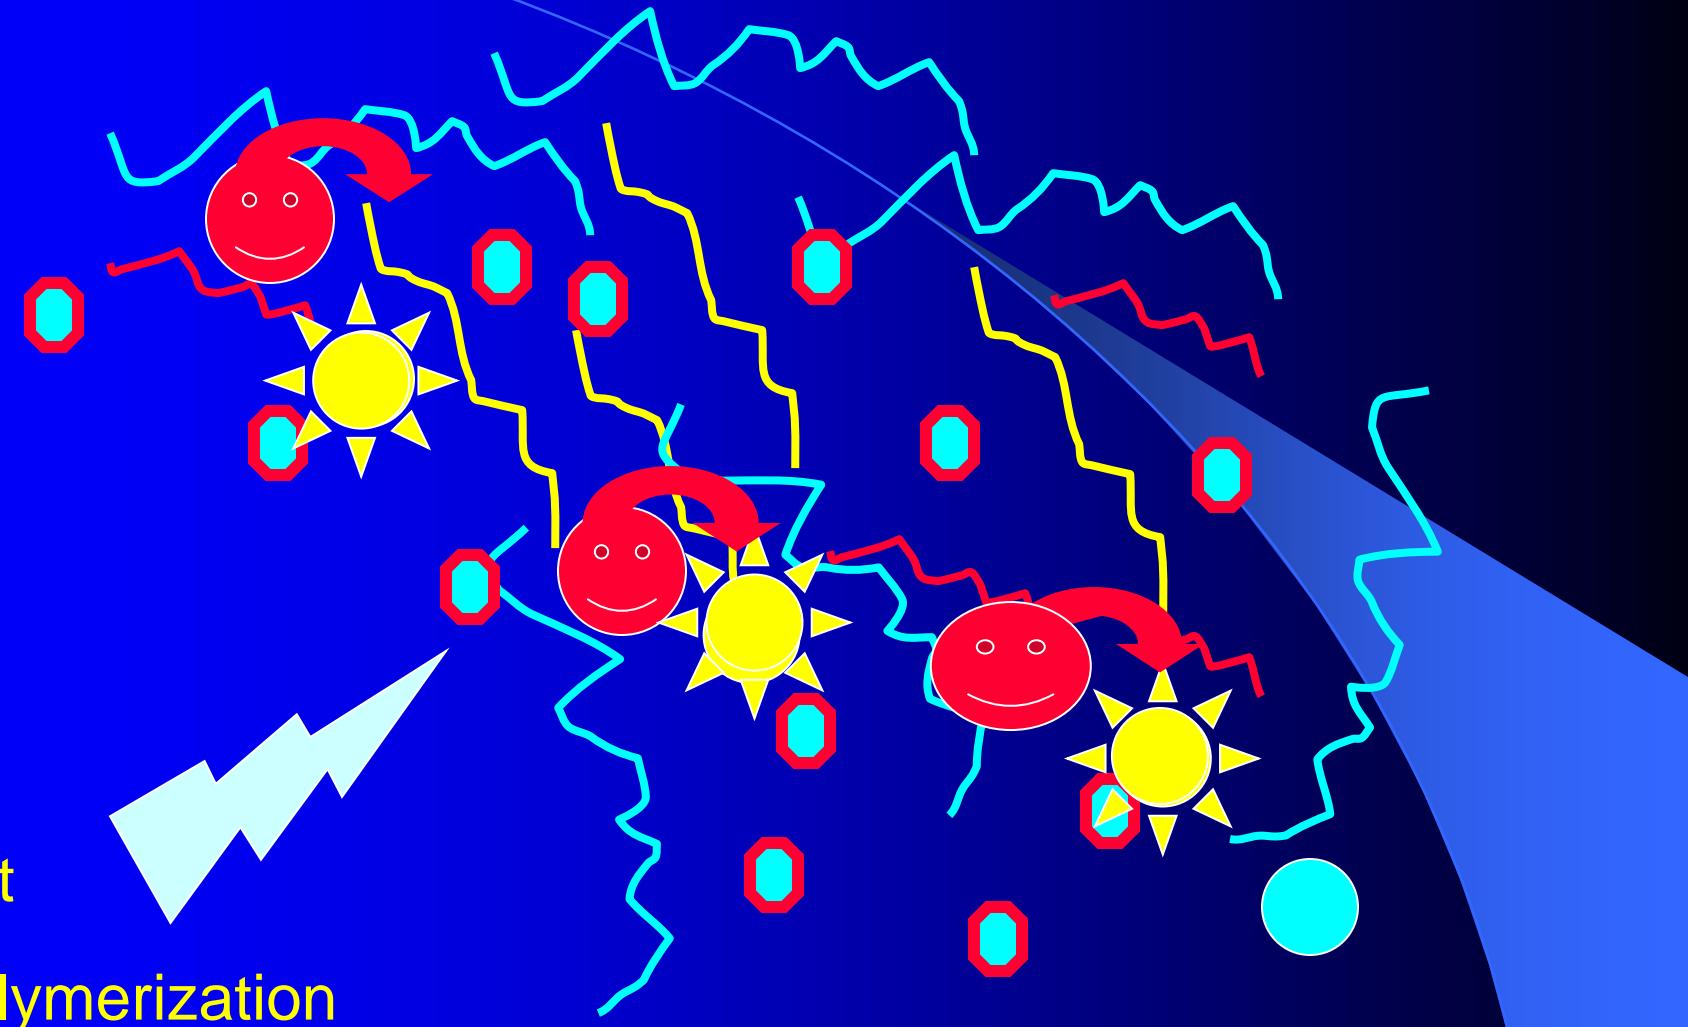

Bevel of enamel on axial walls

Composite material

Amalgam

Light

Polymerization

Monomer → Polymer

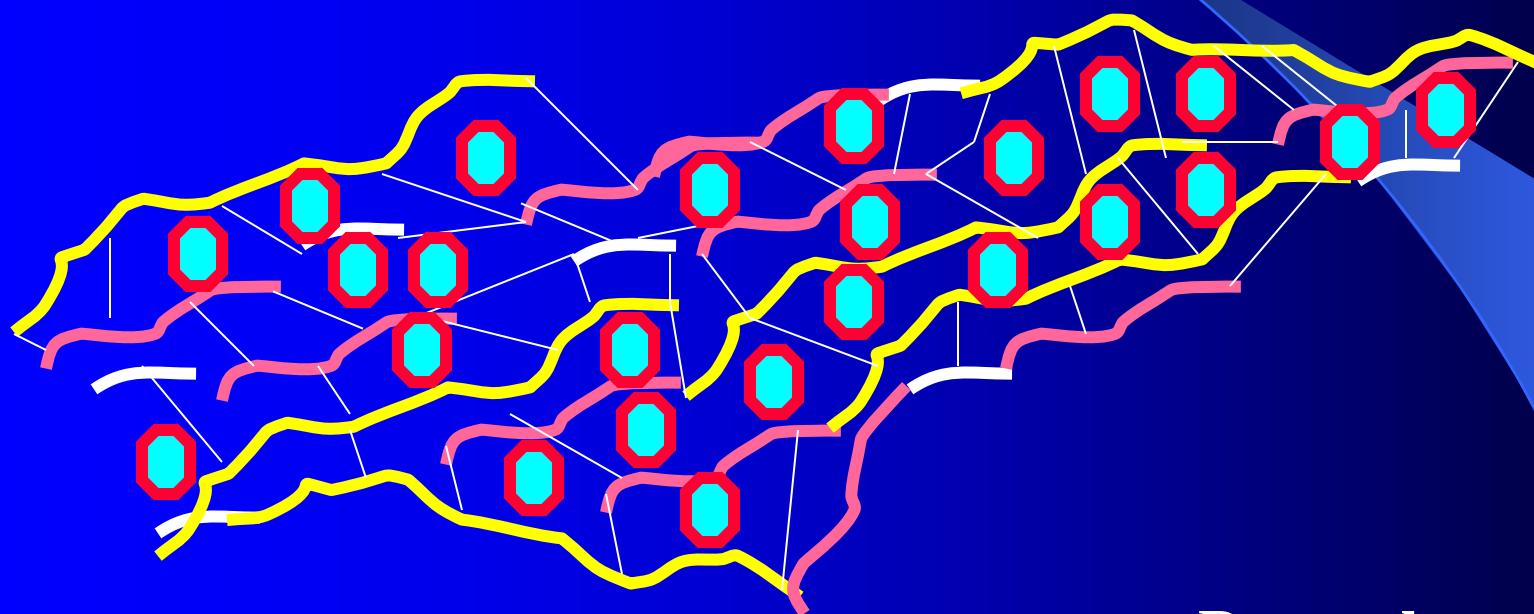

Polymerization – light curing composites

- Mode of polymerization

Phases

- Pre-gel
- Gel-point
- Post –gel phase

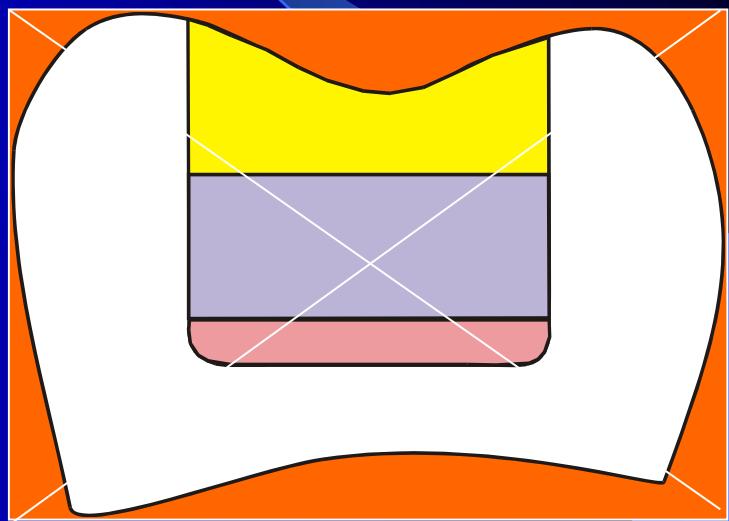

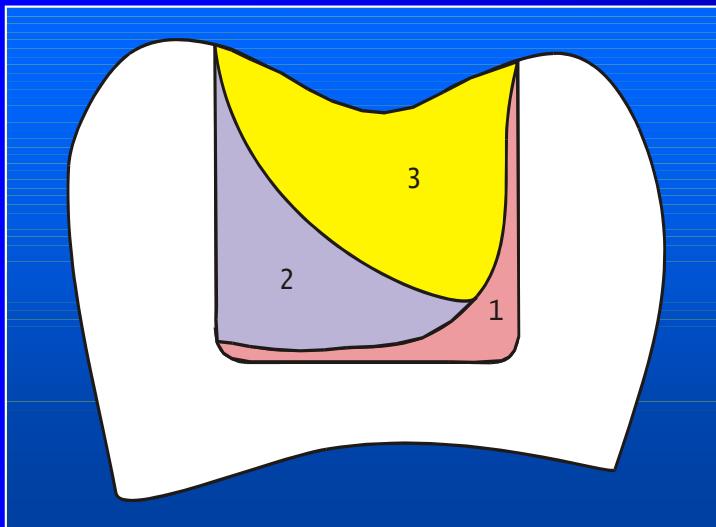

Pre gel phase should be long – soft start

Pre -gel
Gel
Post -gel

Placement of the material

Correct

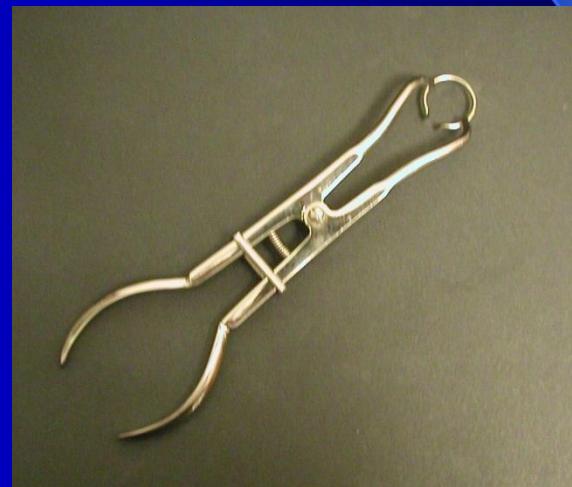

Matrices for composites in class II.

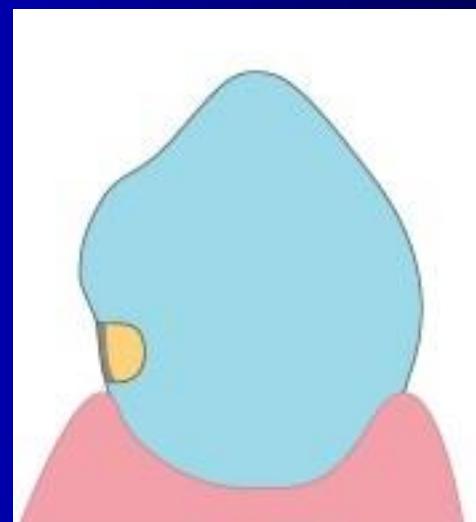

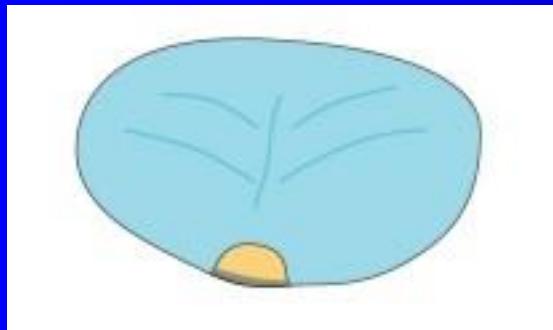

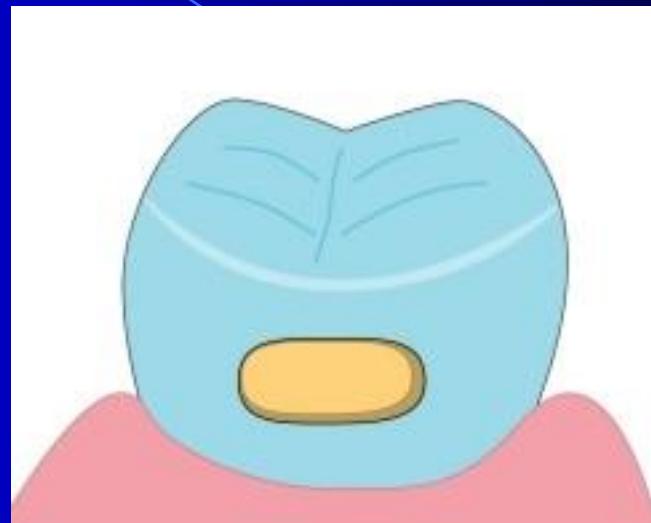

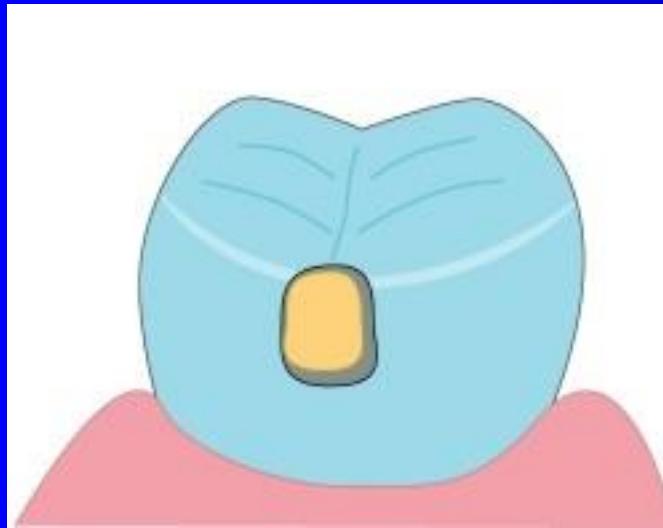

- Matrix band + matrix retainer
- Segmental matrix + separator

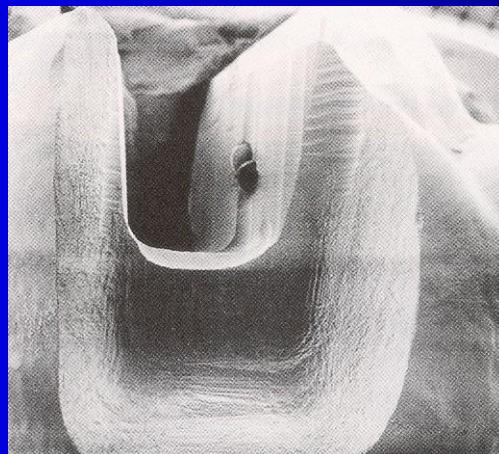

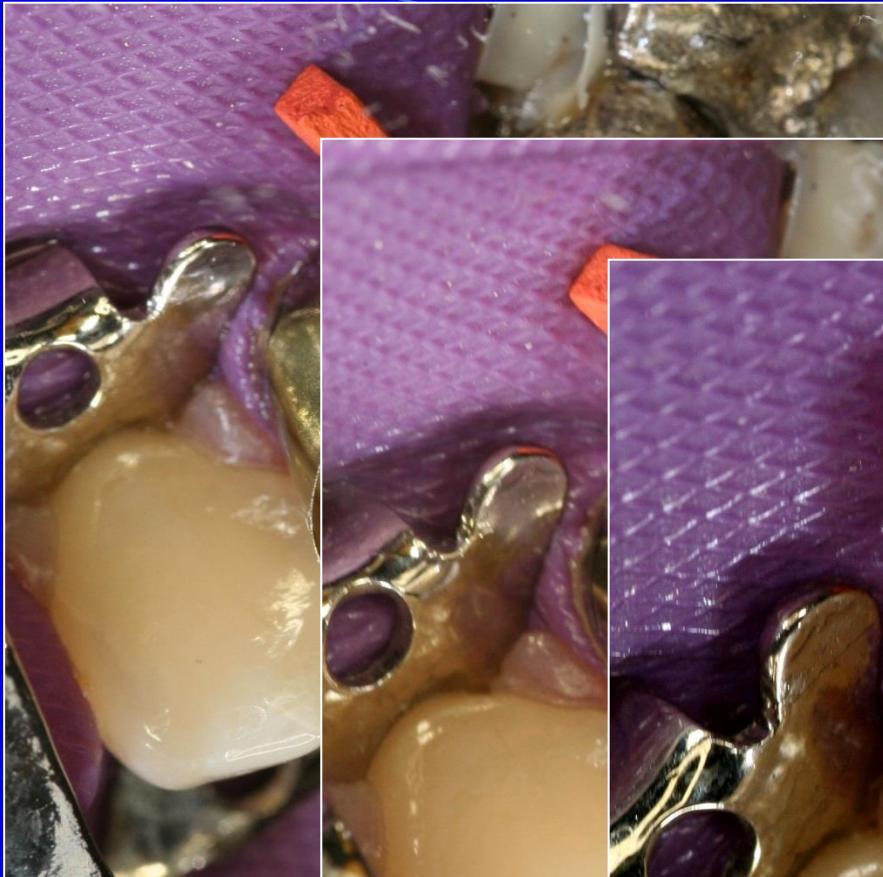

Alternative preparation – adhesive slot

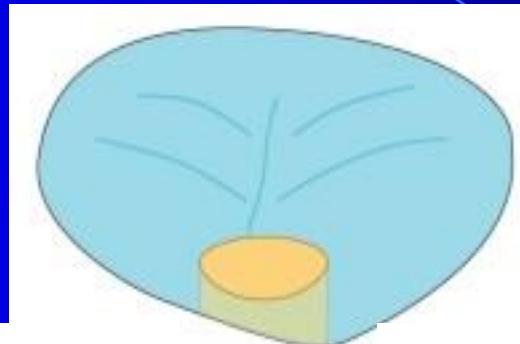

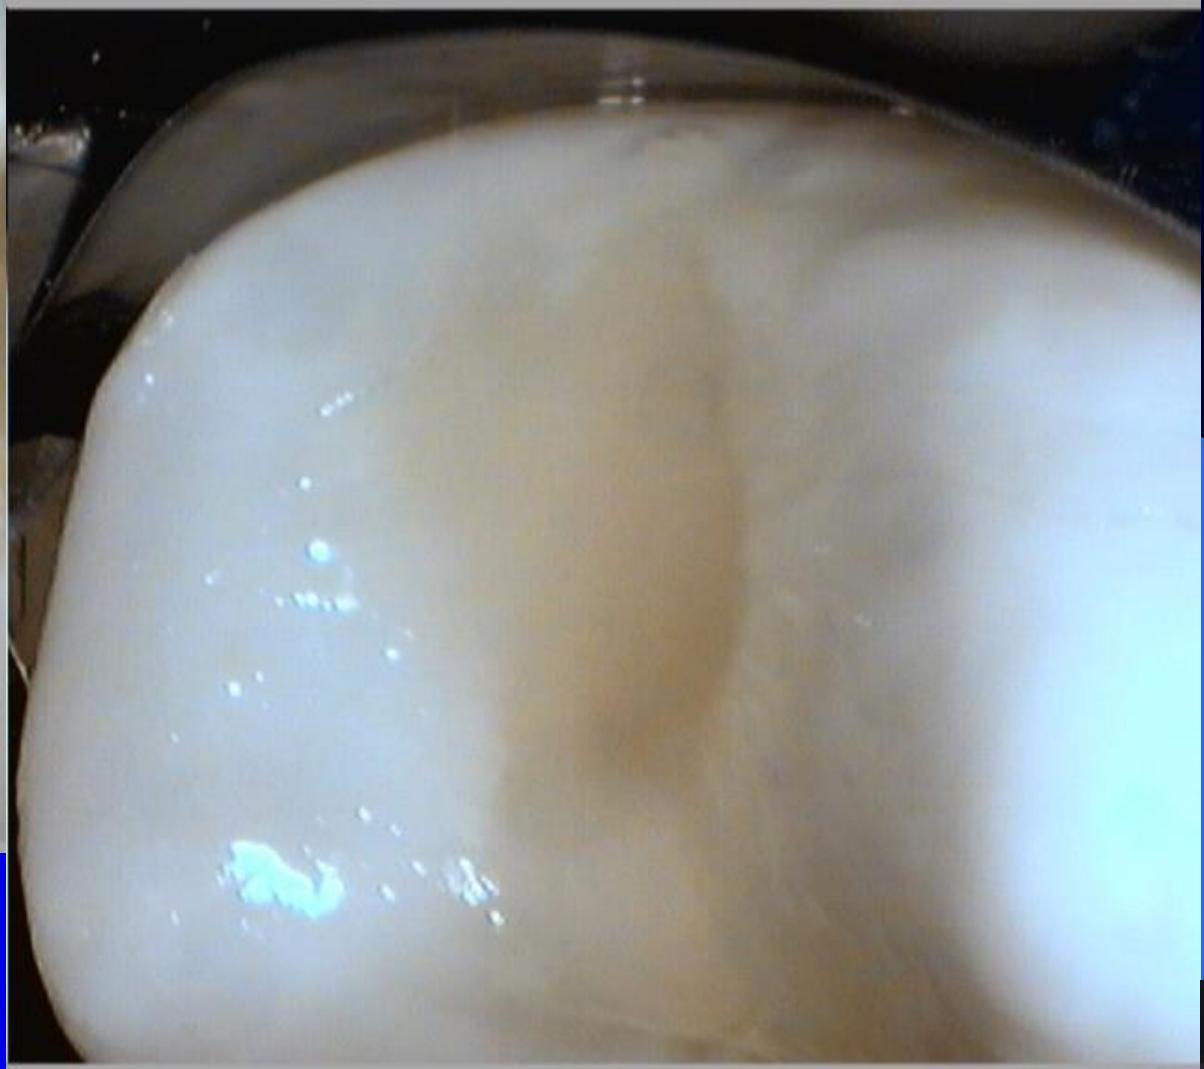

Tunnel preparation

1. Low caries risk
2. Proximal ridge without infrade
3. Good cooperation
4. Small caries lesion

1. Magnification(Loups or microscope)
2. Miniinstruments
3. Dezinfektion
4. GIC in capsules or composite
5. BW post op

Glassionomer and class II.

- Temporary filling – first phase for the sandwich technique
- Tunnel filling (preparation)
