Differential diagnosis of back pain

Department of Orthopaedic surgery MU & UH Brno - MUDr. Jan Kocanda, MUDr. Jan Sklenský

Čtvrtek SIMU Ortopedie a rehabilitace CZ+ENG VLOR7X1c aVLOR7X1

- dvě skupiny po 10 (+- 4) studenti
- dva lektori: Ortopedie FN Brno a FNUSA

HARMONOGRAM

07:30 - 08:45 teorie - artroskopie obecně/entezopatie/bursitidy+ klinické vyšetření

08:45 - 09:00 pauza

09:00 - 10:00 praxe na simulátoru + case reports

10:00 - 10:15 pauza

10:15 - 11:30 teorie - páteř + klinické vyšetření

11:30 - 11:45 pauza

11:45 - 12:30 praxe na simulátoru + case reports

FNUSA lektor

FN Brno lektor

Ortopedická klinika LF MU a FN Brno - MUDr. Michael Lujc, MUDr. Jan Kocanda

Summary

- Definition
- Etiology and Epidemiology
- Risk factors
- Differential diagnosis
- Examination
- Red flags/Yellow flags
- Literature

Definition

Back pain is defined by a triad of symptoms:

- pain
- muscle tension
- stiffness tied to a topographically defined area of the body.
- the pain may radiate to the extremities

According to time

- Acute pain (0 - 6 weeks)
It can be a transient pain (hours - 2 days) that subsides spontaneously, usually without medical intervention. More often it lasts for days to weeks, it can progress together with neurological symptomatology. It can appear repeatedly.
- Subacute pain (6-12 weeks)
- Chronic pain (continuous or recurrent pain for more than 12 w.)

According to location

• Neck and arm pain

- trauma
- cervical spondylosis
- metastatic disease / infection
- cervical radiculopathy
- cervical myelopathy
- ankylosing spondylitis

• Thoracic back and rib pain

- trauma
- metastatic disease / infection
- thoracic disc herniation
- osteoporotic compression fracture
- trauma

• Low back pain

- muscles strain
 - disc herniation / discogenic pain
 - degenerative spondylolisthesis
 - spinal stenosis
 - lumbar radiculopathy
 - abdominal aortic aneurism
- ## • Sacroiliac pain
- SI infection
 - ankylosing spondylitis
- ## • Sacral pain
- coccydynia
 - sacral insufficiency fracture

CONSTRUCTING A DIFFERENTIAL DIAGNOSIS

- Most low back pain is caused by conditions that are troublesome but not progressive or life-threatening.
- **Serious back pain** (pain due to a systemic or visceral disease or pain with significant neurologic symptoms or signs)
- **Nonspecific back pain** related to the musculoskeletal structures of the back, called mechanical back pain.

According to etiology 1/3

1. Back pain due to disorders of the **musculoskeletal** structures

- A. Nonspecific (mechanical) back pain: no definite relationship between anatomic abnormalities seen on imaging and symptoms
- B. Specific musculoskeletal back pain: clear relationship between anatomic abnormalities and symptoms
 - A. Lumbar radiculopathy due to herniated disk, osteophyte, facet hypertrophy, or neuroforaminal narrowing
 - B. Degeneration.....Spinal stenosis, spondylolisthesis.....
 - C. Cauda equina syndrome

According to etiology 2/3

2. Back pain due to **visceral disease** (serious, requires specific and rapid diagnosis and treatment)

A. Retroperitoneal

- A. Aortic aneurysm
- B. Retroperitoneal adenopathy or mass

B. Pelvic

- A. Prostatitis
- B. Endometriosis
- C. Pelvic inflammatory disease

C. Renal

- A. Nephrolithiasis
- B. Pyelonephritis
- C. Perinephric abscess

D. GI

- A. Pancreatitis
- B. Cholecystitis
- C. Penetrating ulcer

According to etiology 3/3

3. Back pain due to **systemic disease** affecting the spine

A. Serious and emergent (requires specific and often rapid treatment)

A. Neoplasia

- A. (1) Multiple myeloma, metastatic carcinoma, lymphoma, leukemia
- B. (2) Spinal cord tumors, primary vertebral tumors

B. Infection

- A. (1) Osteomyelitis
- B. (2) Septic diskitis
- C. (3) Paraspinal abscess
- D. (4) Epidural abscess

B. Serious but nonemergent (requires specific treatment but not urgently)

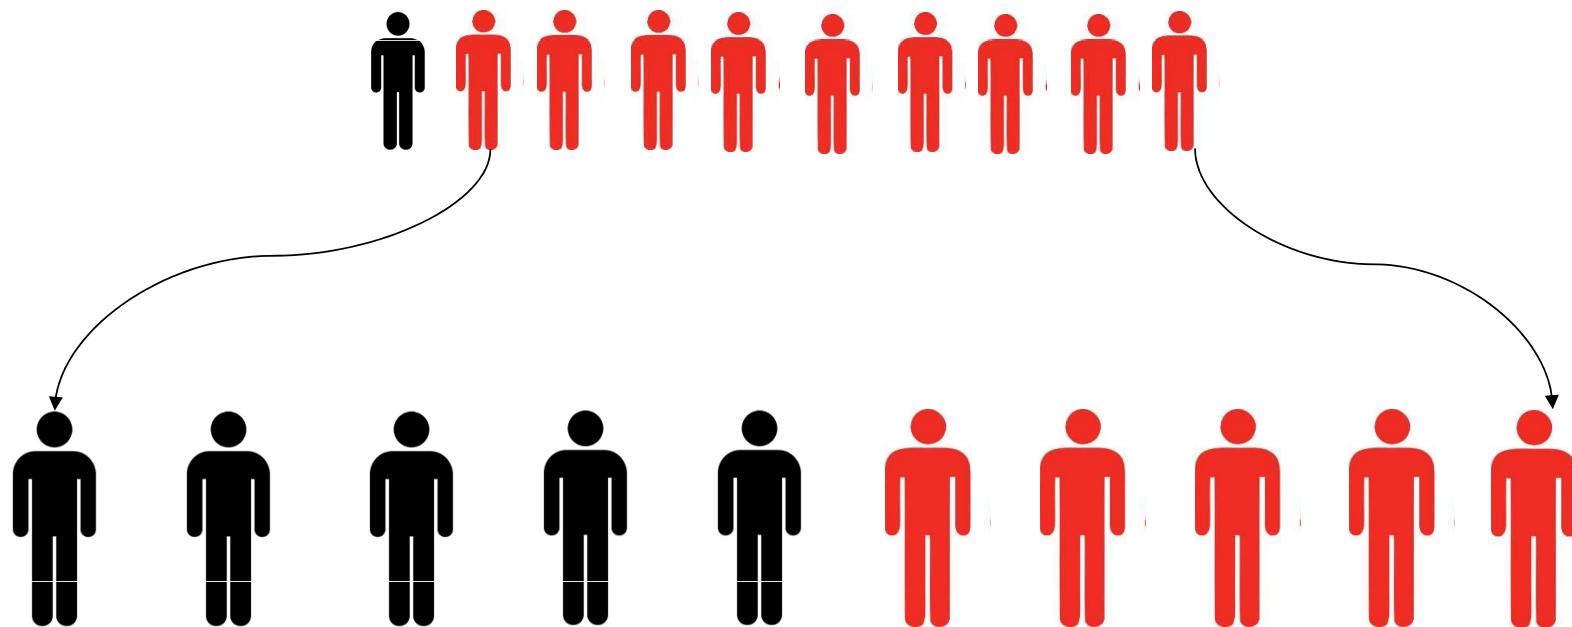

A. Osteoporotic compression fracture

- B. Inflammatory arthritis
 - A. (1) Ankylosing spondylitis
 - B. (2) Psoriatic arthritis
 - C. (3) Reactive arthritis
 - D. (4) Inflammatory bowel disease-associated arthritis

Epidemiology

- Prevalence 60 – 85%
- Aging population, obesity, sedentary lifestyle

Epidemiology

Classification of low back pain (Waddell 1987)

– Specific low back pain

- the cause is an identifiable progressive pathology with possible involvement of nervous structures (15%):
 - intervertebral disc herniation
 - spondylolisthes
 - spinal stenosis
 - segmental instability
 - fractures, tumors, inflammations

– Non-specific low back pain

- pain without an identifiable specific anatomical or neurophysiological disorder (85%)

Diagnostic triad (Waddell 1998, Barsa, Häckel 2004, Vrba 2008)

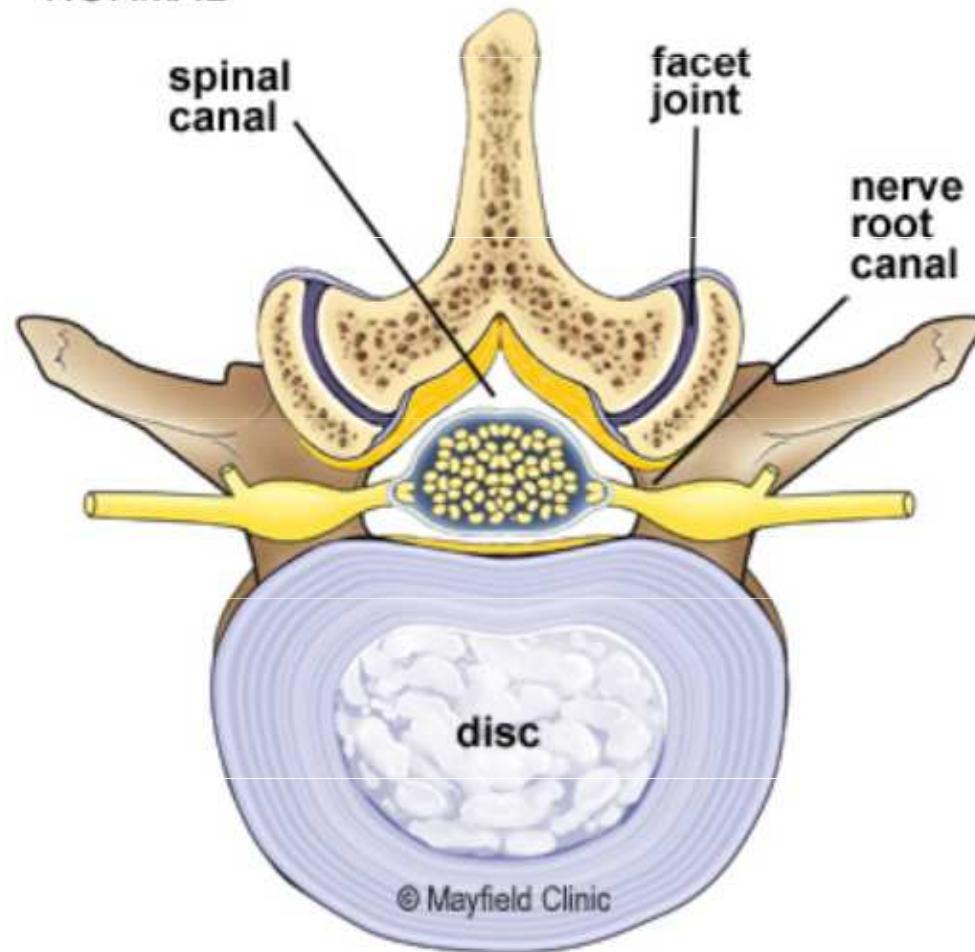

- **I. Simple back pain**
 - Obvykle muskuloskeletální původ, postižení LS oblasti
 - nejčastěji mezi 20- 55 lety, dobrá prognóza konzervativní léčby
 - 90% se uzdraví do 6 týdnů
- **II. Root (neurogenic) pain**
 - typical lateralization with projection to DK with paresthesias
 - loss of sensitivity and nerves (motor skills, reflex changes) due to neurological symptomatology.
Prognosis of conservative treatment worse (50% recover within 6 weeks)
- **III. Pain caused by a serious disease of the spine - “red flags“**
 - Tumors, inflammations, fractures-deformities, serious neurological diseases.
 - Risk factors: age under 20 and over 55, spinal injury, pain in the thoracic spine and abdomen without obvious causes, pain at rest, permanent and independent of movement

Mechanical causes

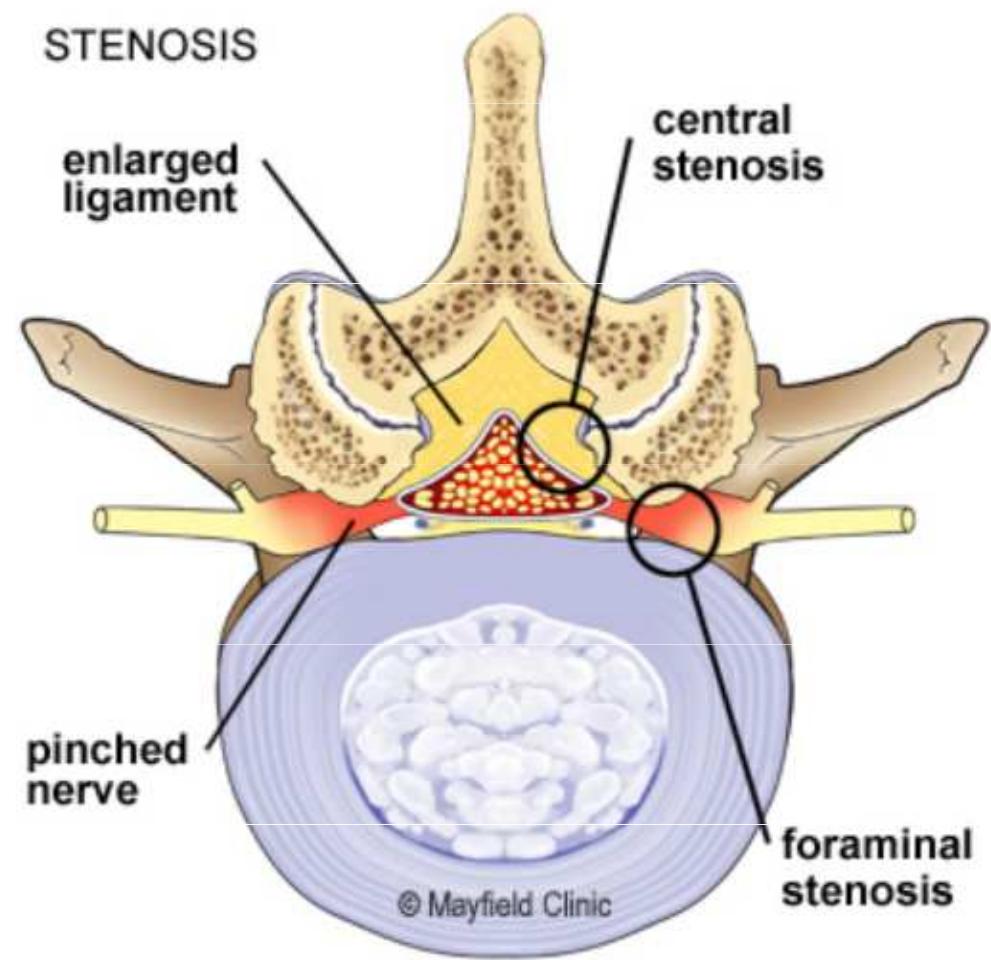

- **Spinal stenosis**
- Spondylosis
- Spondylolysis, spondylolisthesis
- Herniated disc
- Scoliosis
- Trauma

NORMAL

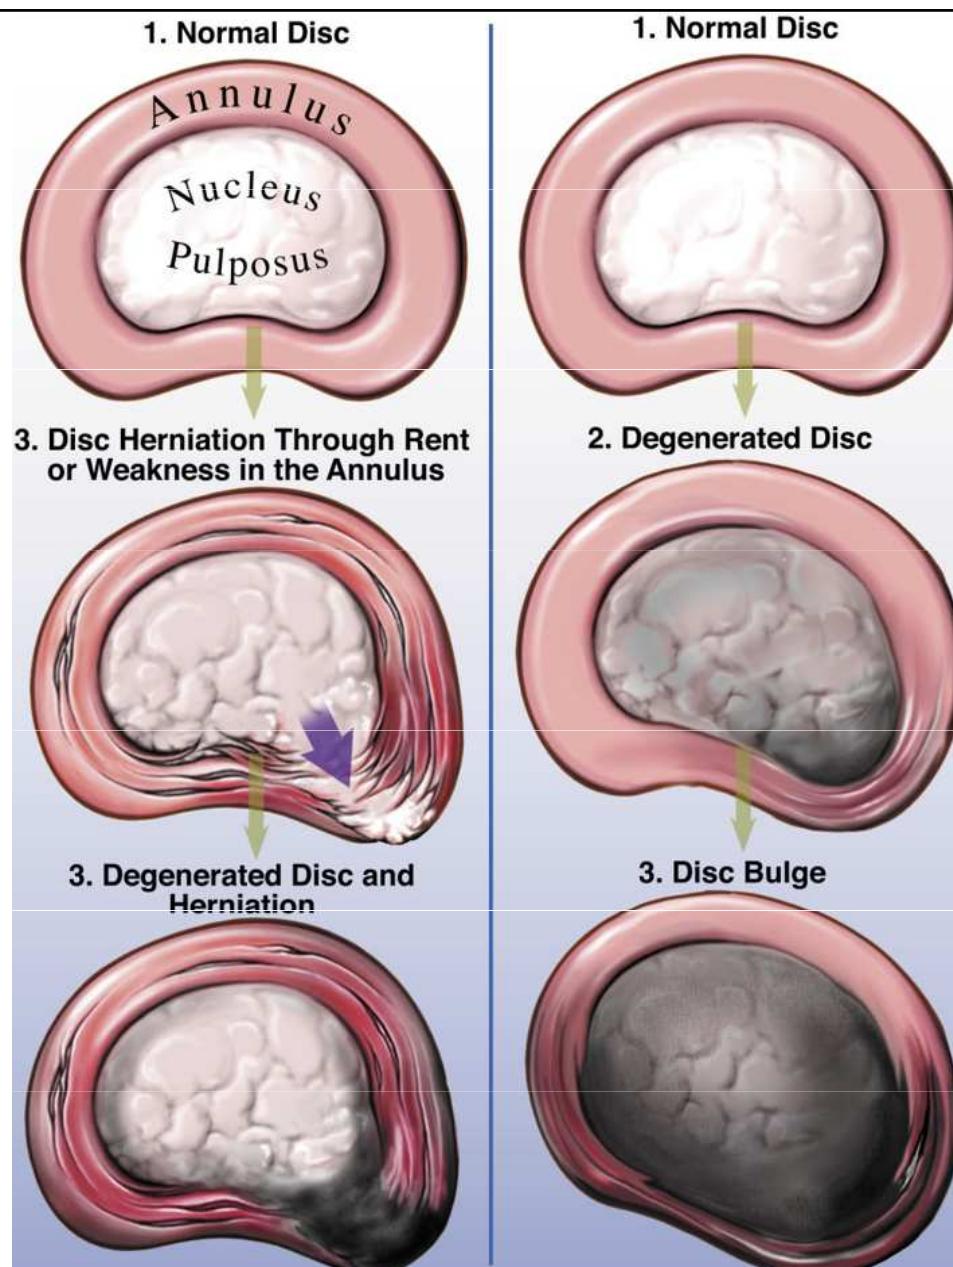

STENOSIS

Mechanical causes

- Spinal stenosis
- **Spondylosis**
- Spondylolysis, spondylolisthesis
- Herniated disc
- Scoliosis
- Trauma

Spine tumors

Primary (3%)

Benign (25%)

- Osteoid osteoma
- Osteoblastoma
- Aneurysmal bone cyst
- Osteochondroma
- Neurofibroma
- Giant cell tumor
- Eosinophilic granuloma
- Hemangioma

Secondary (97%)

Malignant (75%)

- Osteosarcoma
- chondrosarcoma
- Ewings sarcoma
- chordoma
- fibrosarcoma

- Lungs
- Breast
- Prostate
- Thyroid gland
- Kidneys
- GIT

Malignant tumors

- Chondrosarcoma
- Osteogenic sarcoma
- Ewing's sarcoma
- Chordoma
- Multiple myeloma
- Lymphoma
- Metastases - breast, lung, prostate, thyroid, kidney

Benign tumors

- Osteochondroma
- Osteoid osteoma and osteoblastoma
- Giant cell tumor
- Aneurysmal bone cyst
- **Hemangioma**
- Eosinophilic granuloma

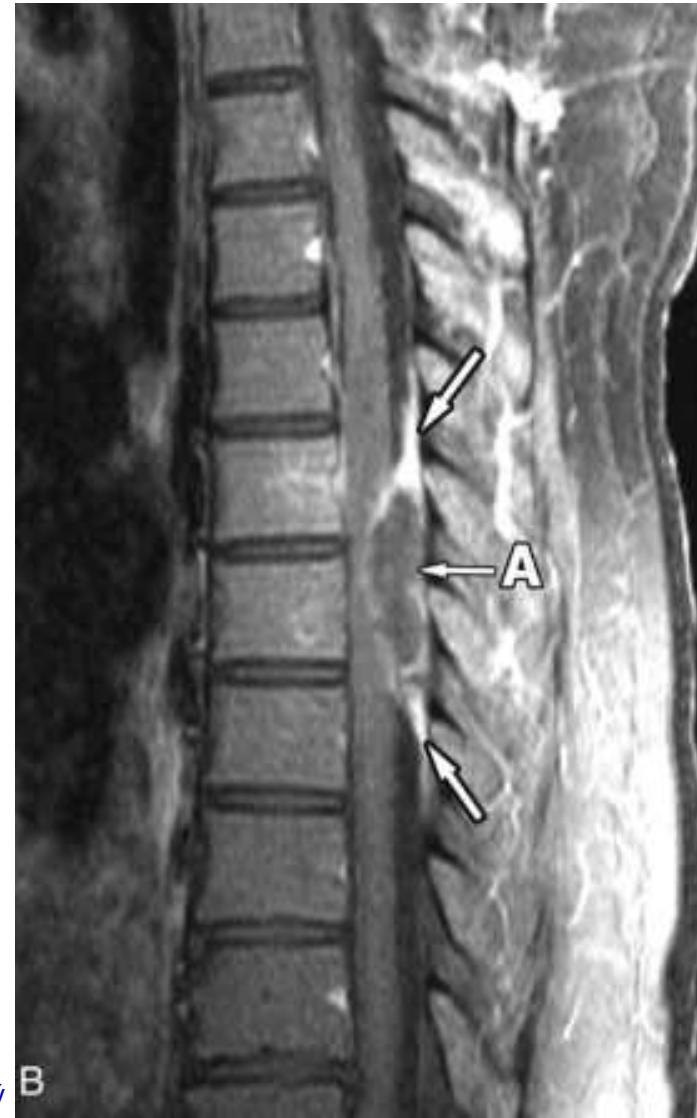

Infection

- **Osteomyelitis**
- Epidural abscess
- **Discitis**
- Granulomatous infection
- TBC

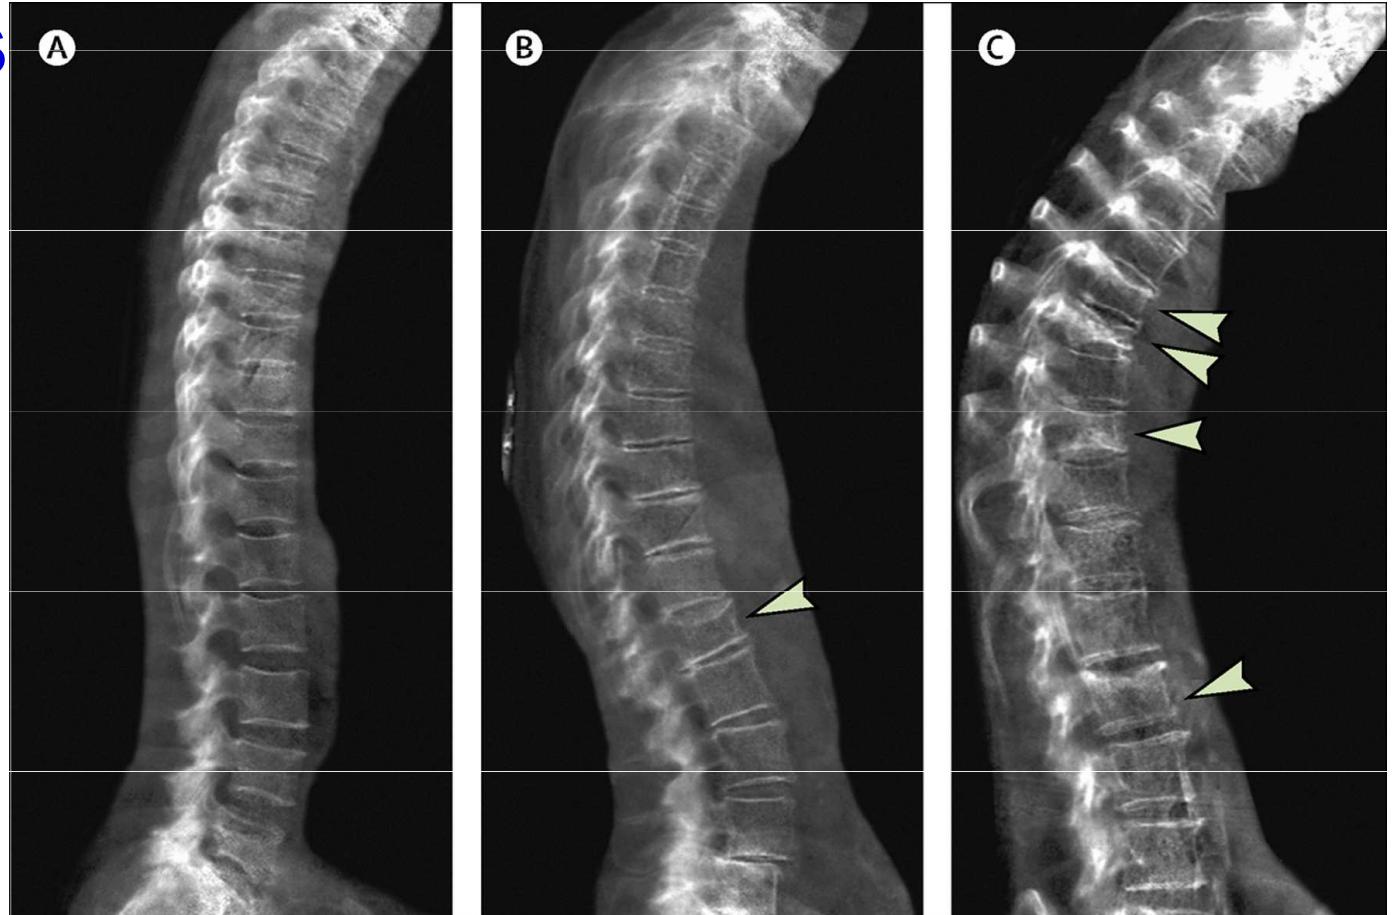

Infection

- Osteomyelitis
- **Epidural abscess**
- Discitis
- Granulomatous infection
- TBC

Osteoporosis

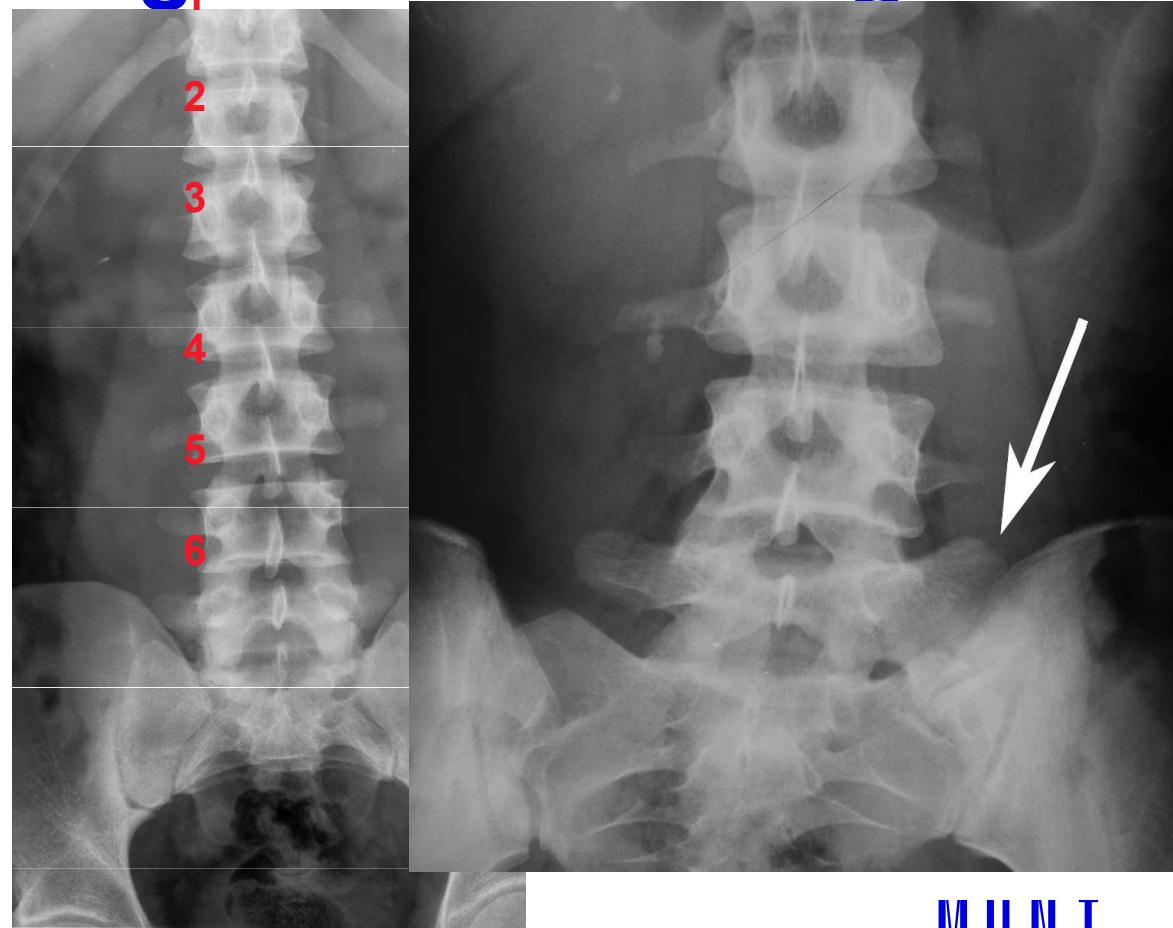

- senilní
- postmenopauzální
- farmakologicky induk.

Congenital and other degenerative changes

- Sacralization, lumbarization
- Bertolotti's syndrome
- Lumbar hyperlordosis with vertical sacrum
- Baastrup phenomenon

Congenital and other degenerative changes

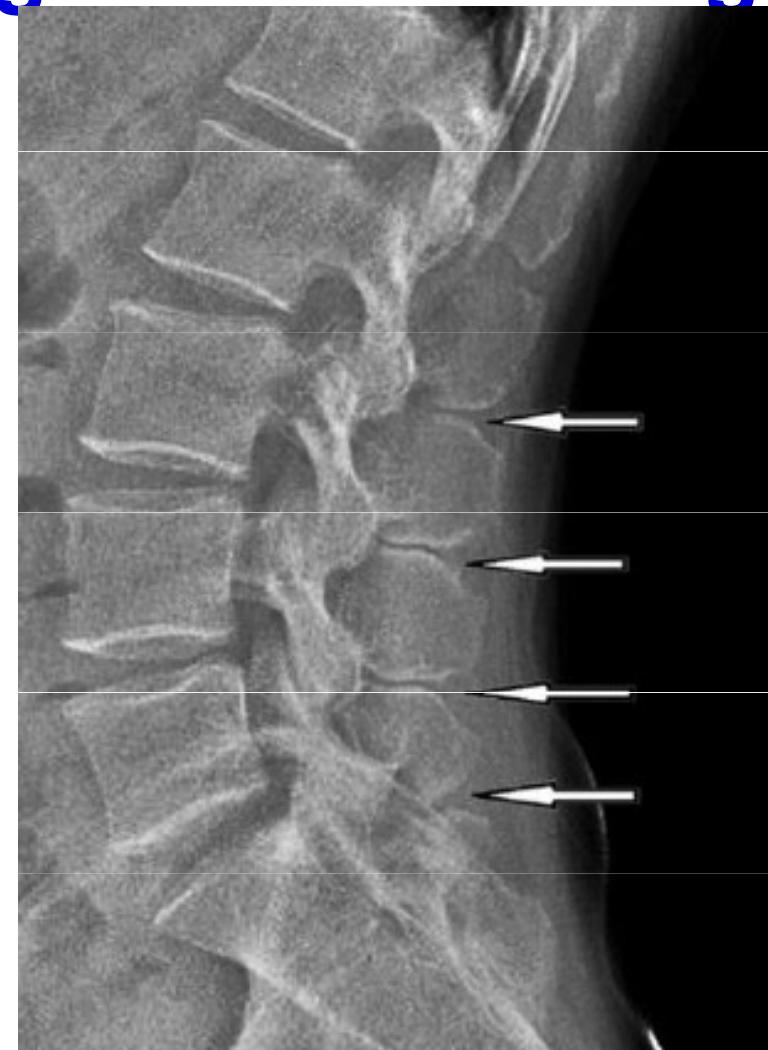

- Sacralization, lumbarization
- Lumbar hyperlordosis with horizontal sacrum
- Baastrup phenomenon

Spondyloarthropathy

- Ankylosing spondylitis – HLA - B27+
- Rheumatoid arthritis

Spondyloarthropathy

- Ankylosing spondylitis –
- Rheumatoid arthritis

EXAMINATION

- Anamnestic data – RA, OA, FA, AA, PSA
- Perfect clinical examination and documentation
- XR – standardized images
- CT – acute trauma
- MRI - the gold standard for soft tissue
- Other imaging modalities after MDT
- Consultation of expertise in the case of therapeutic doubts

Red flags

- **infection x tumor x trauma x cauda equina syndrome**
- New onset back pain age <20, 50+
- Night pain
- Saddle anaesthesia, bladder bowel disturbance
- Fever, loosening weight
- Anamnesis of cancer, steroid use

BACK PAIN RED FLAGS

AGE	<18 ≥50	Congenital anomaly Malignancy Infection AAA
IMMUNOCOMPROMISED	Chronic kidney disease Chronic liver disease	Infection (osteomyelitis, discitis, spinal epidural abscess)
INTRAVENOUS DRUG USE	Any IVDU	Infection (osteomyelitis, discitis, spinal epidural abscess)
HISTORY OF CANCER	Any cancer	Tumor Pathologic Fracture
SYSTEMIC SYMPTOMS	Fever/rigors Weight loss	Infection Malignancy
ANTICOAGULATION	warfarin, target specific anticoagulants	Epidural hematoma
TRAUMA	Major in young patients, minor trauma in elderly or those with rheumatologic disease	Fracture
SYMPTOMS OF CORD COMPRESSION	Saddle anesthesia Urinary or bowel incontinence or retention Perineal sensory loss Anal sphincter laxity	Compression via tumor, disc, abscess etc
SEVERE or PROGRESSIVE NEUROLOGIC DEFICIT		Compression via tumor, disc, abscess etc

Red flags – TUNA FISH

- **T**rauma
- **U**nexplained Weight Loss
- **N**eurologic Symptoms
- **A**ge over 50
- **F**ever
- **I**VDU (IntraVenous Drug User)
- **S**teroid Use
- **H**istory of Cancer

Yellow flags

- "yellow/warning flags"
- psychosocial risk factors
- e.g. wrong attitudes and superstitions of the patient about back pain
- unsuccessful diagnostic and treatment results
- behavioral, emotional, family and work problems
- catastrophizing and depression
- passive coping with pain (passive expectation of pain, limitation or exclusion of physical and social activity)
- increase in muscle tension (muscle imbalance)
- signs of protective behavior (taking comfortable positions, limping, overuse of support aids, etc.)
