

Composites

Chemically bonded mixture of organic matrix (resin) and inorganic filler

Composition

- **Organic phase - resin**

Bowen's monomer – bisfenol A a

glycidylmethacrylate– Bis GMA

Other dimethacrylate

UDMA

TEGMA

Composition

- **Inorganic phase - filler**

Milled qua

Baryumaluminium glass

Silica

Prepolymer

Composition

- Initiatory system

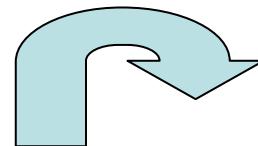

initiator a activator

- Stabilizers
- Pigments
- UV absorbers
- Antioxidants

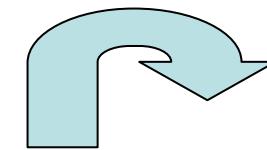

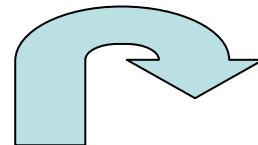

5 Curing of composites

Polymerization
Activator

Initiator

Splitting of double bonds
Creation of the
polymer network

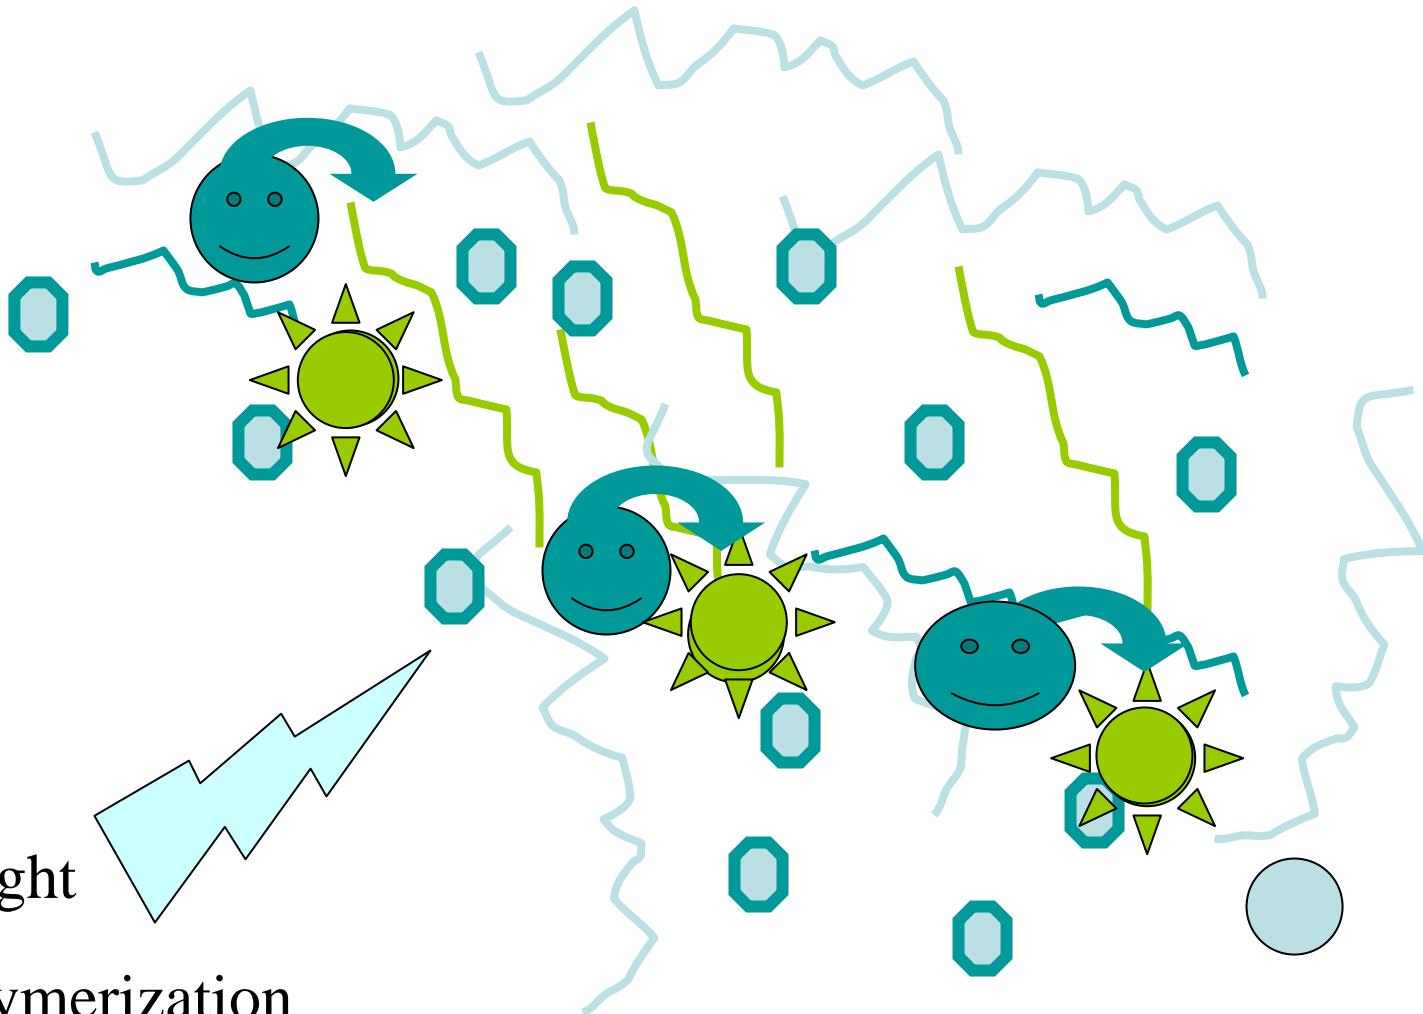

Composite according to mode of curing

- Chemically curing

- Light curing

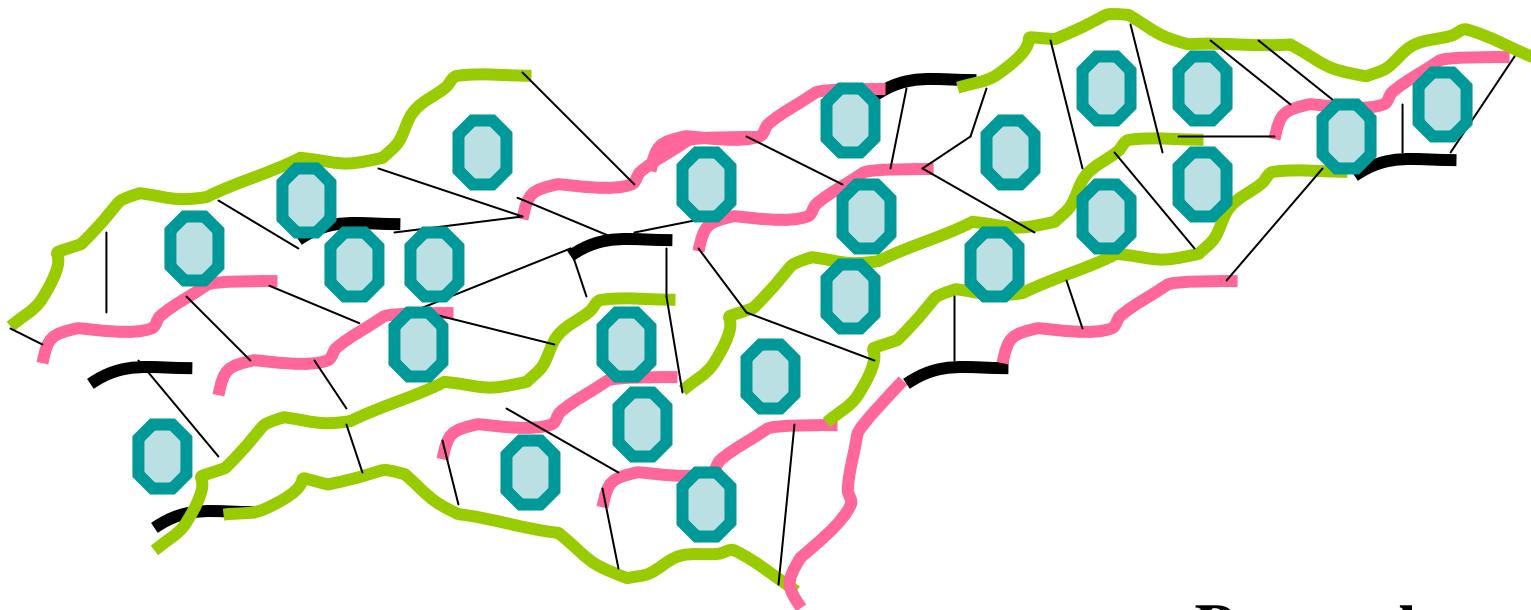

- Dual curing

- Warm curing

Monomer → Polymer

Polymer network

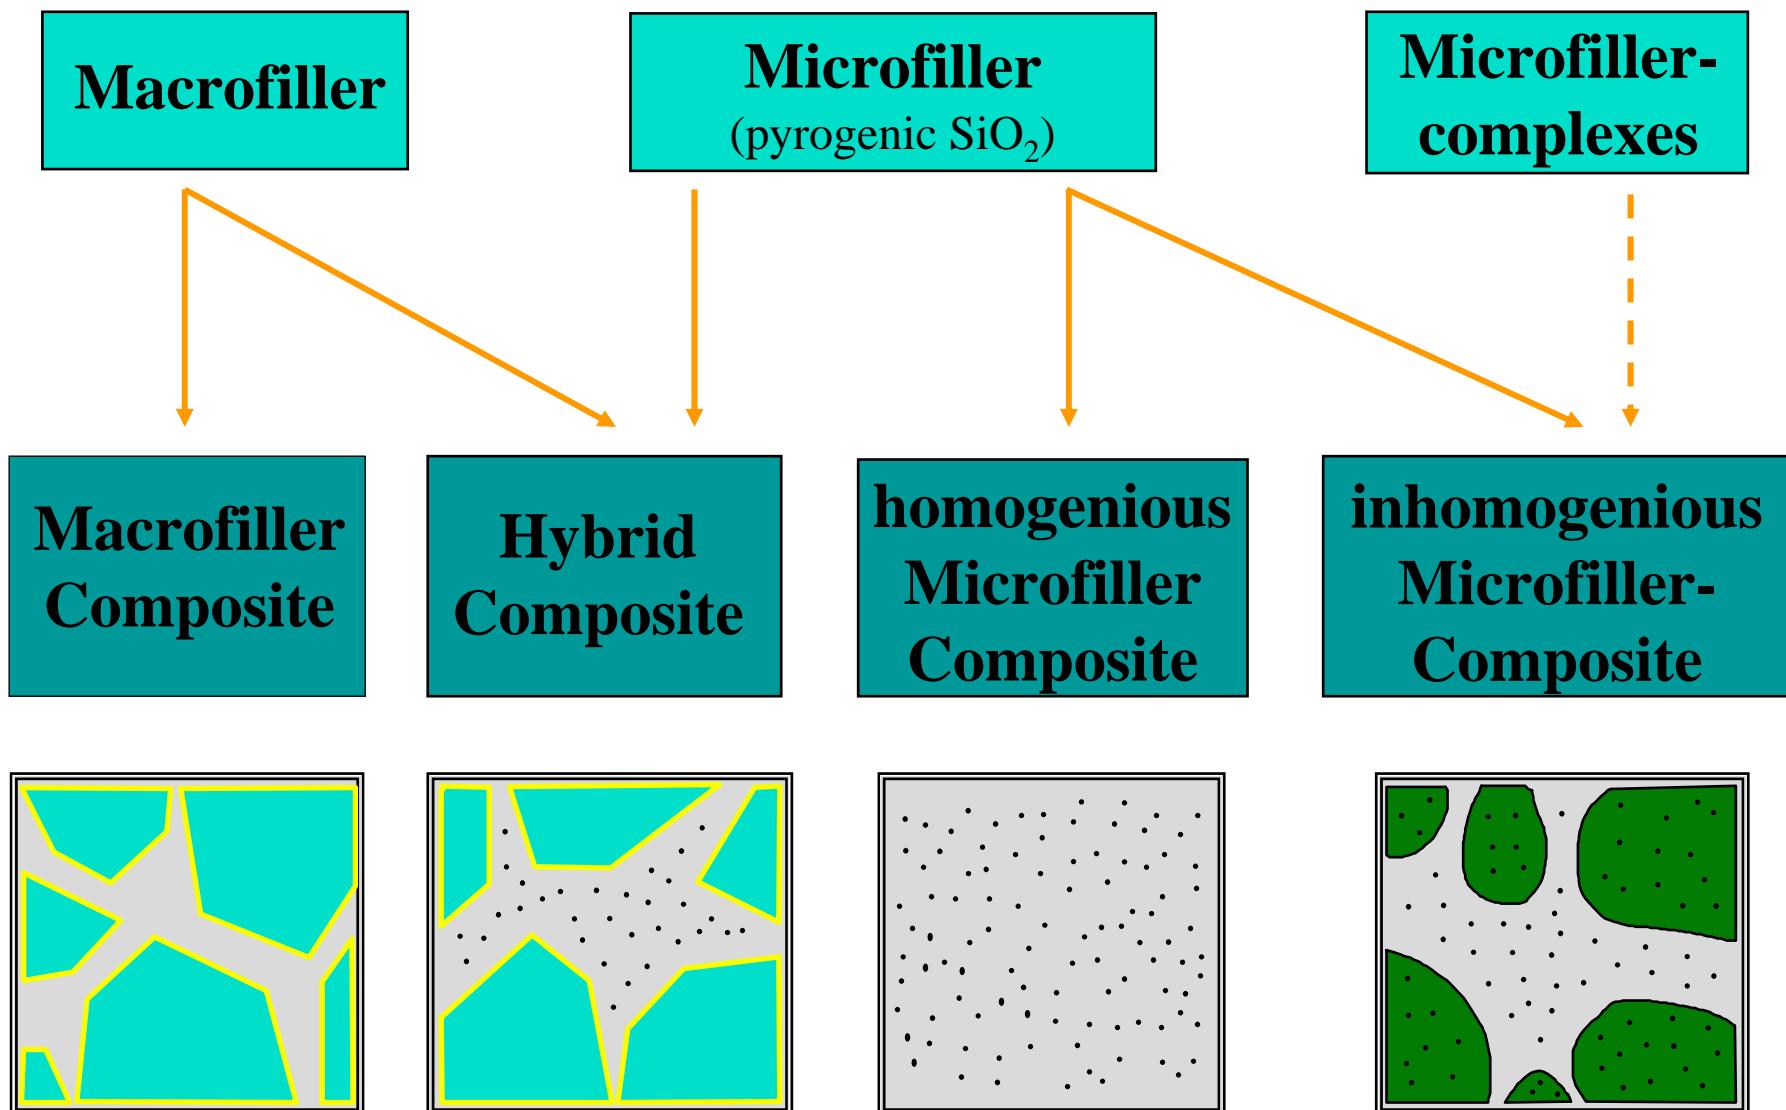

Polymerization shrinkage

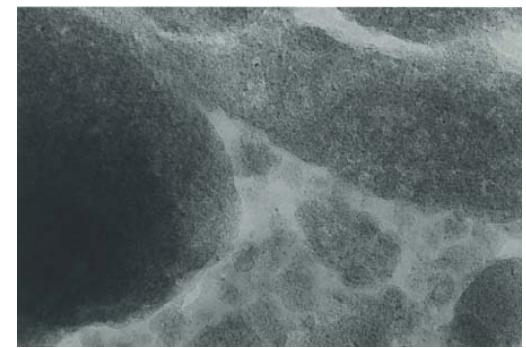

**Pre -gel
G-point
Post -gel**

Classification according to type of fillers

(Philips & Lutz 1984)

Filler particles

Filler size (medium particle size)	Composite category
< 10 µm	hybrid composite
< 5 µm	fine particle hybrid
< 3 µm	ultrafine particle hybrid
< 1 µm	submicron hybrid

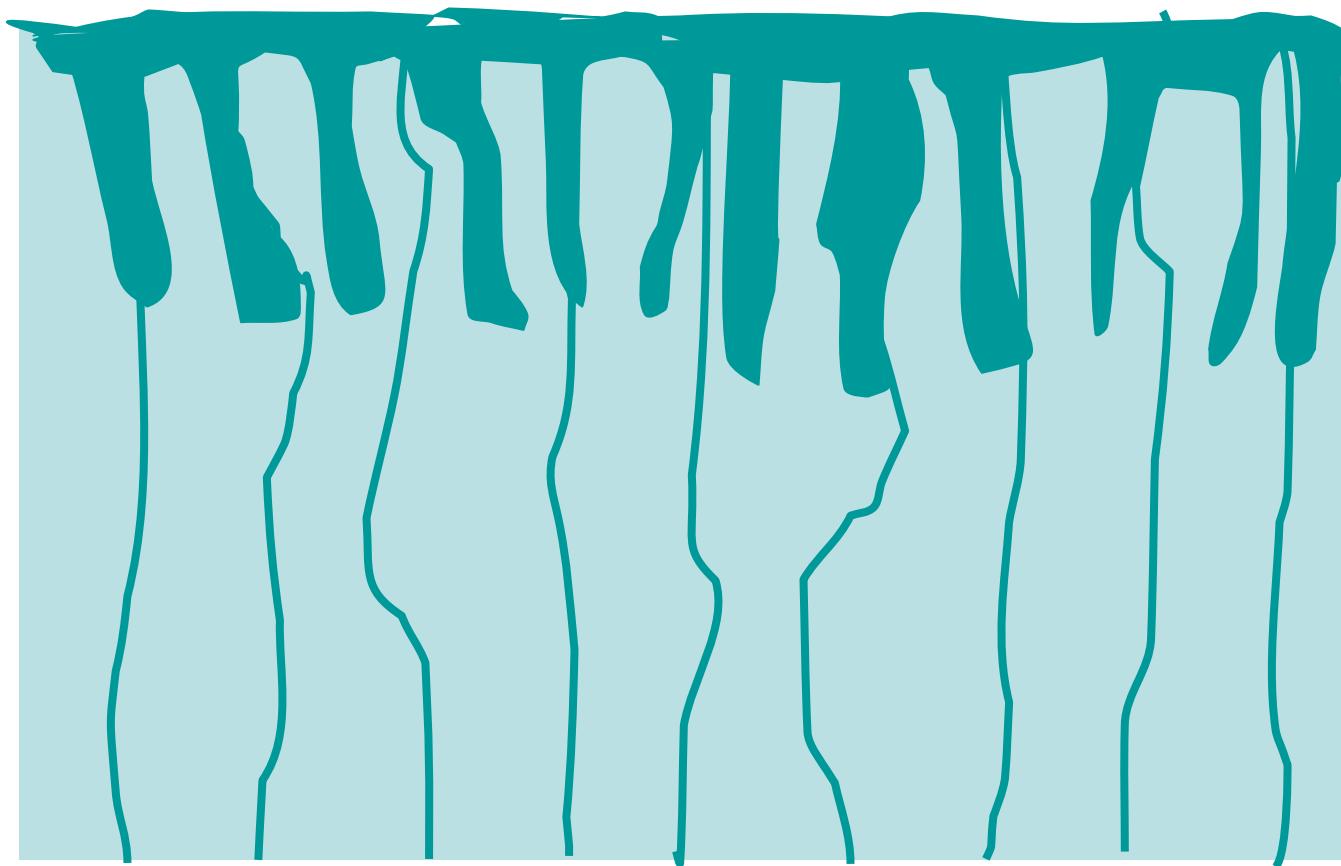

Use of Composites

- **Aesthetic restorations**
- - class III., IV., V., I., II.

Bonding to the tooth structures

Enamel

Ablation of
the aprismatic enamel
Acid etching

Dentin

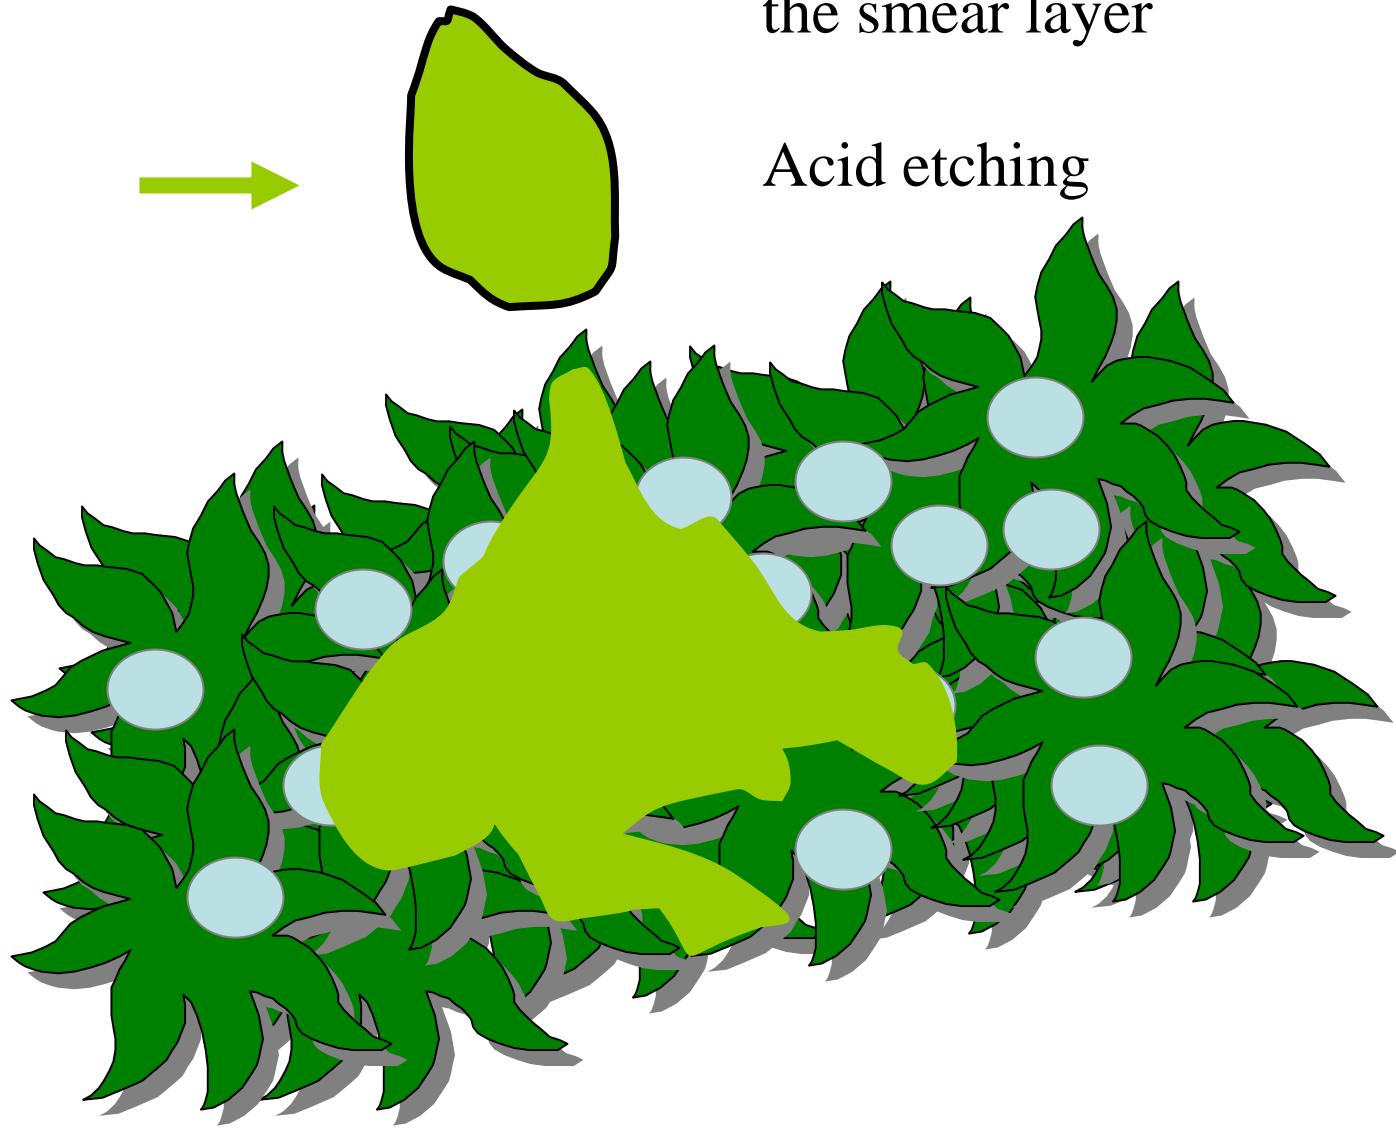

- o More water and organic substances
- o Low surface energy
- o Tubular liquid
- o Communication with the pulp chamber
- o Smear layer

Bonding to the tooth structures

Dentin

Removing of
the smear layer

Acid etching

Konditioner

Demineralization

Increase of the surface energy

Phosphoric acid

Primer

Opening og the collagen network of dentin

Bond

- **Penetrates into the retentive pattern in enamel and the collagen network of dentin (hybrid layer)**

Glasionomer cements

- Composition

Powder: asluminumsilicate glass

Tekutina:

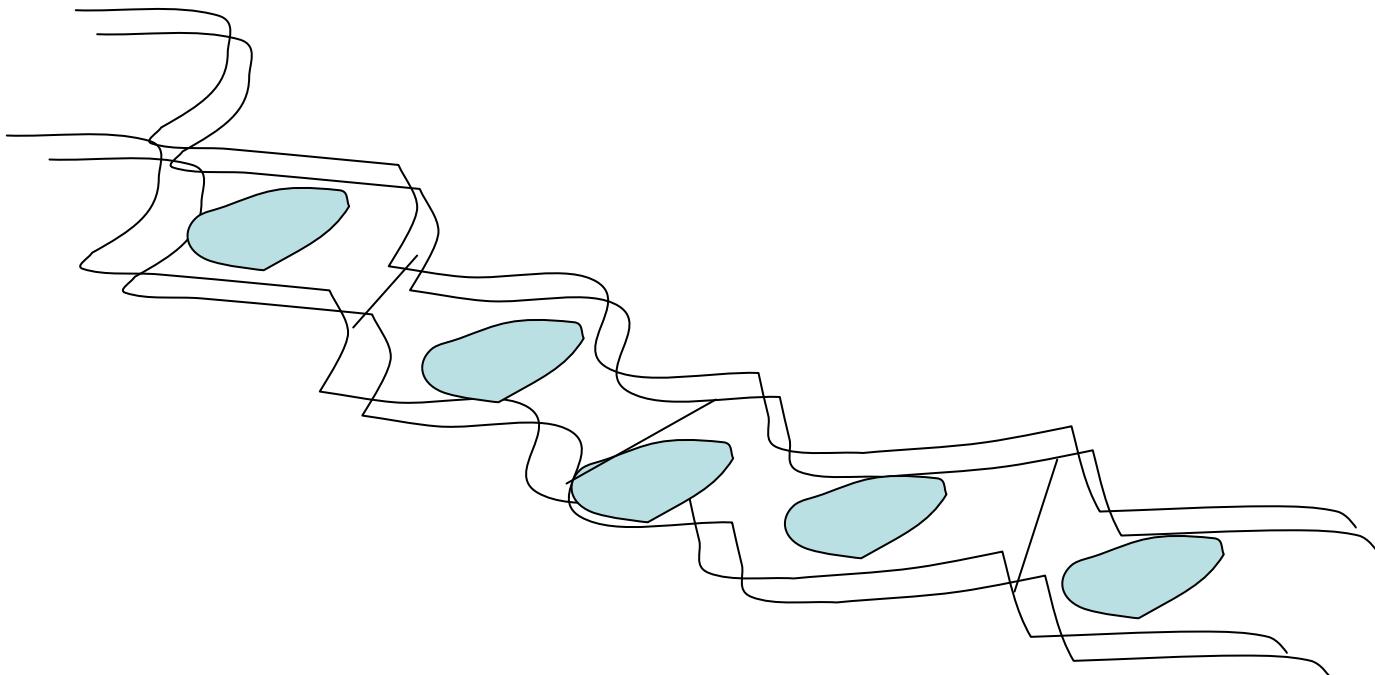

Polyacrylic acid or polymaleic acid

Tartaric acid

Water

Curing of GIC

- Aluminium calcium polyacrylate

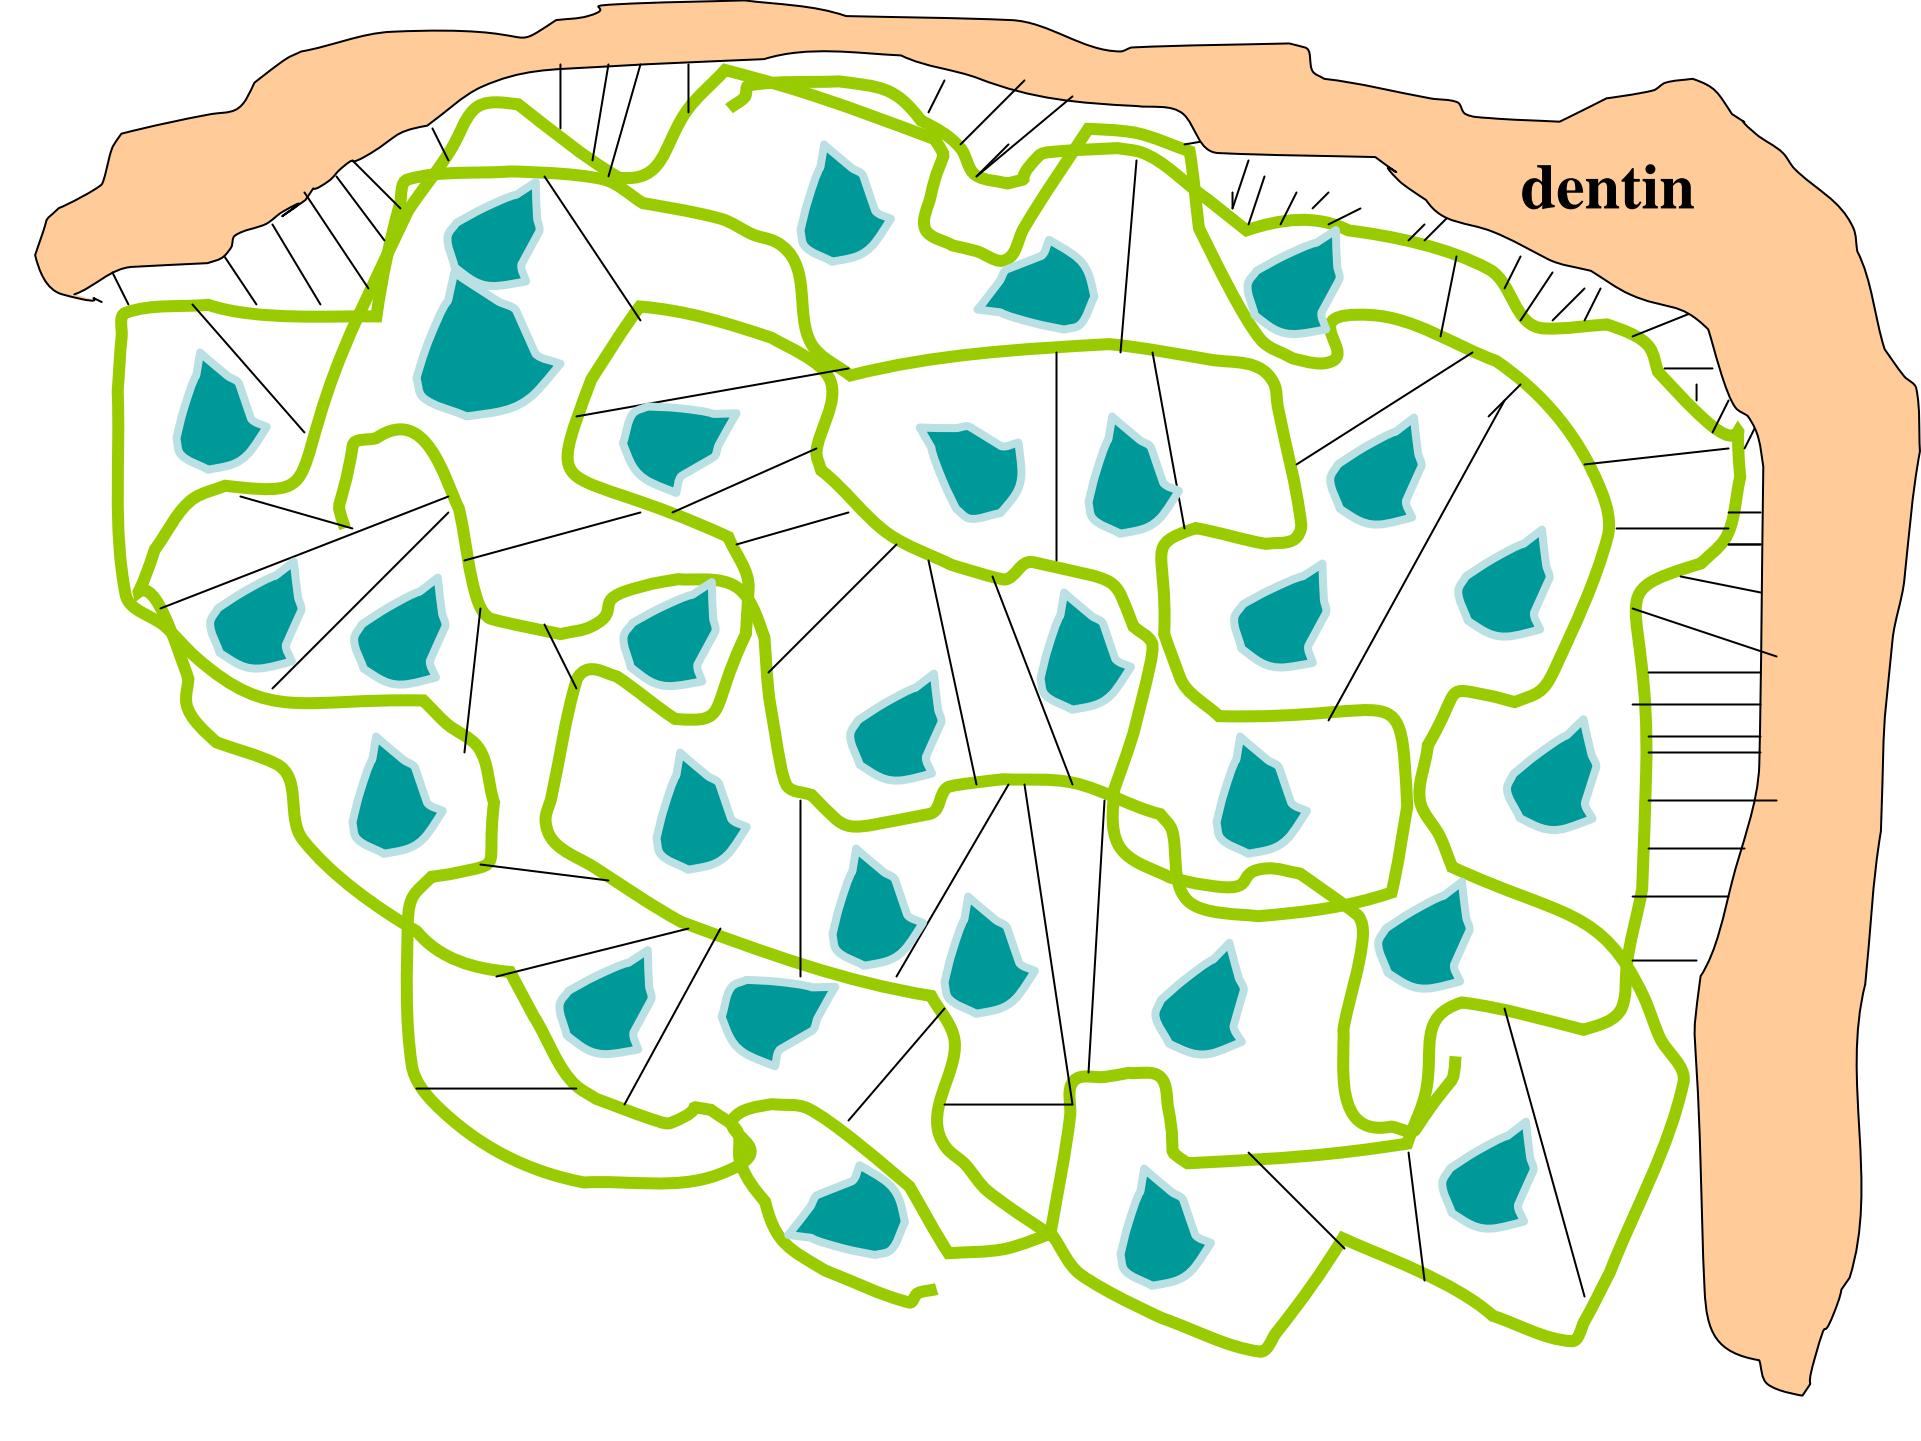

Properties

- Chemical fixation to tooth structure
- Fluoride release
- Favorable thermal expansion
- Acceptable aesthetics

GIC according to mode of curing

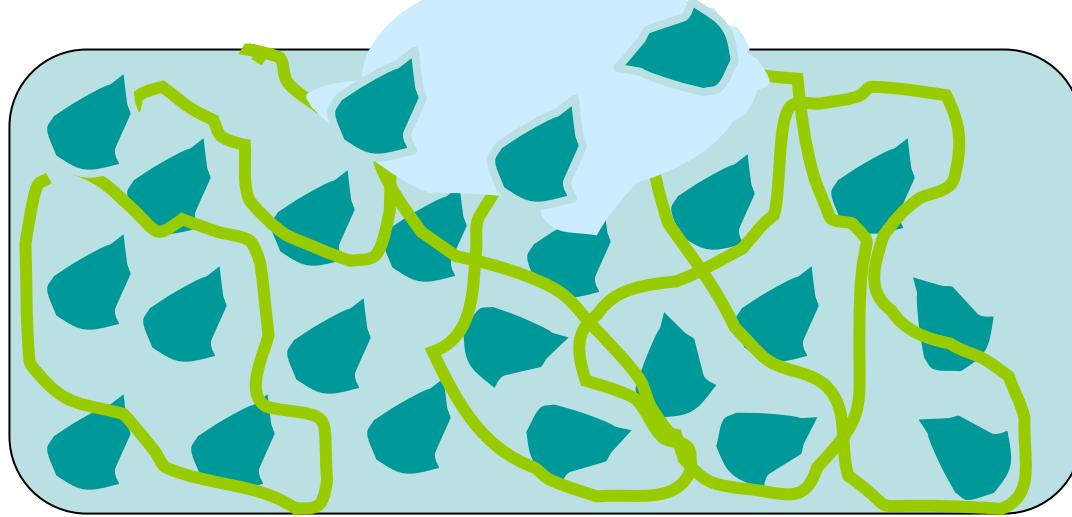

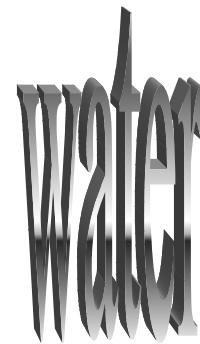

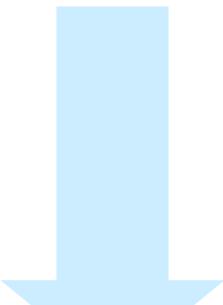

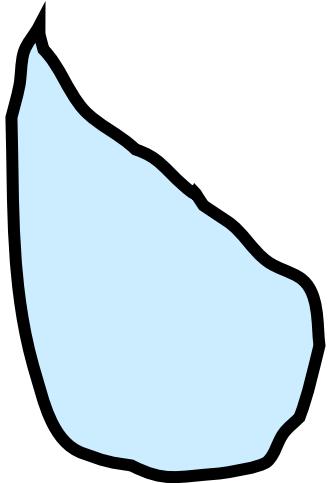

- Chemically curing (acid - base reaction)
- - conventional
- - high strength

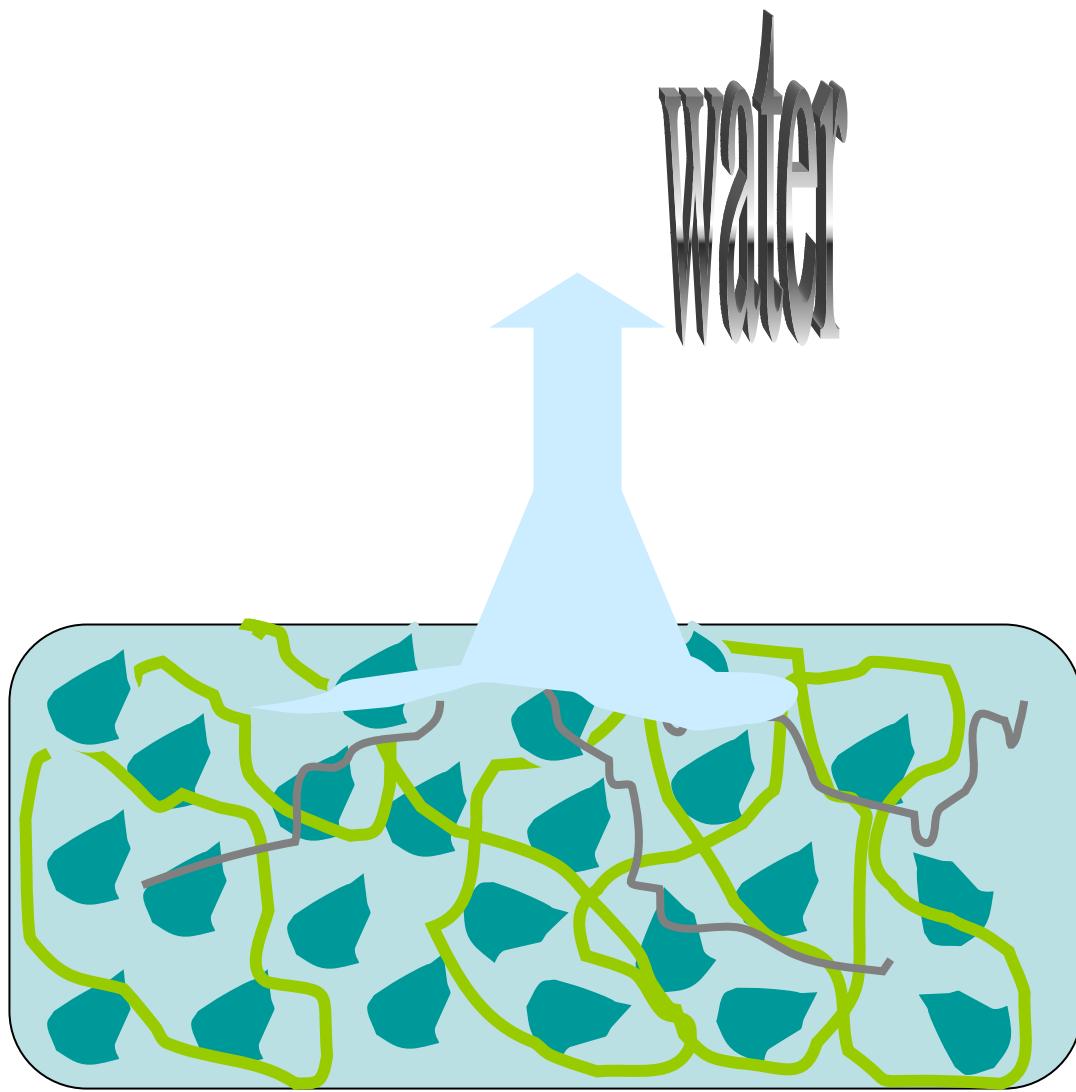

- Light curing (acid -base reaction + polymerization of the resin)

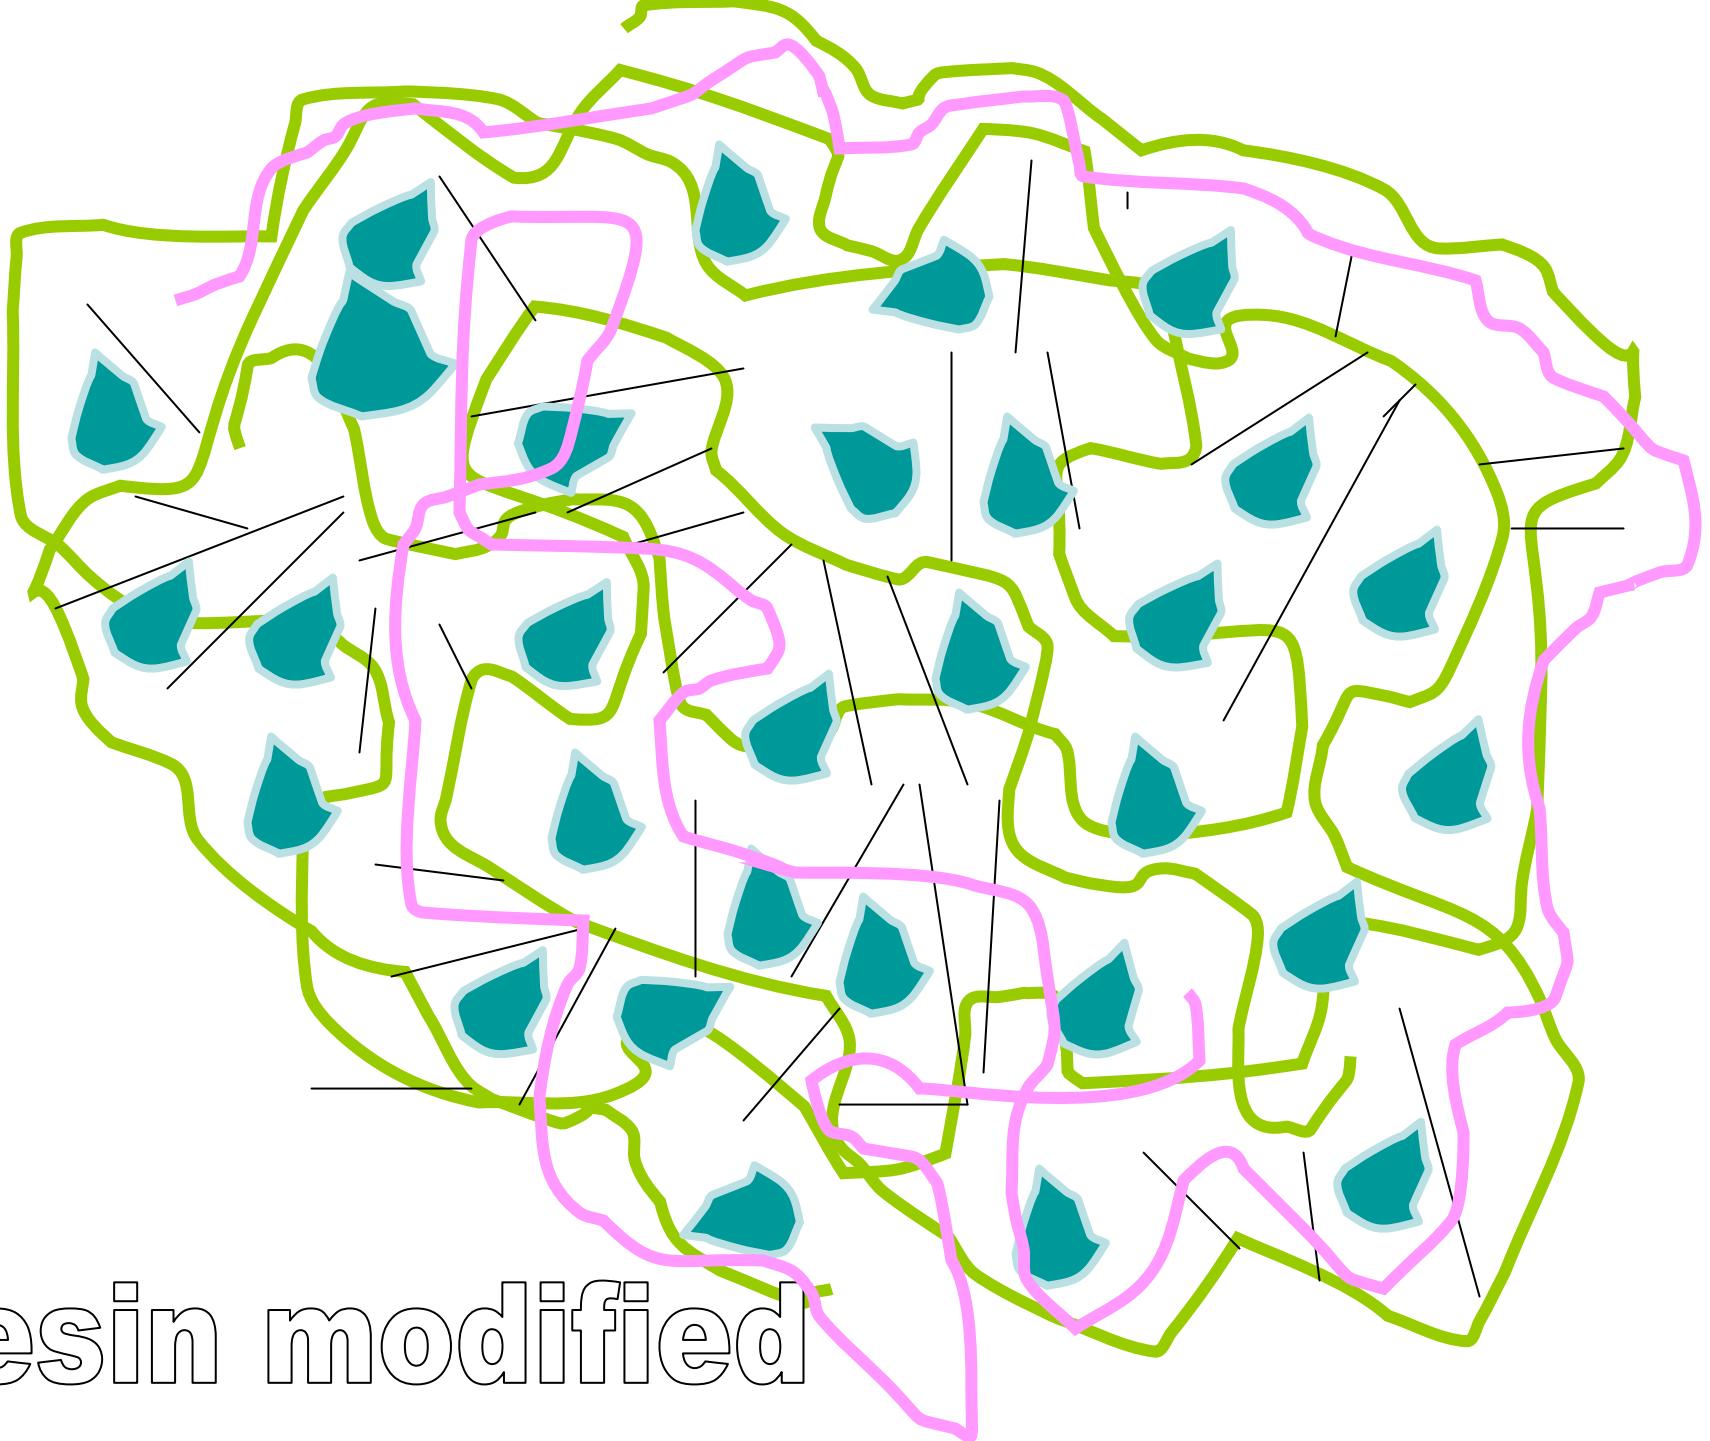

A diagram illustrating the structure of dentin. The outer boundary is a thick orange layer labeled "dentin". Inside, a network of green lines forms a complex, interconnected system of tubules. Numerous small, irregular blue shapes, representing organic material, are distributed throughout these tubules. Some of these blue shapes have thin black lines extending from them towards the outer dentin boundary.

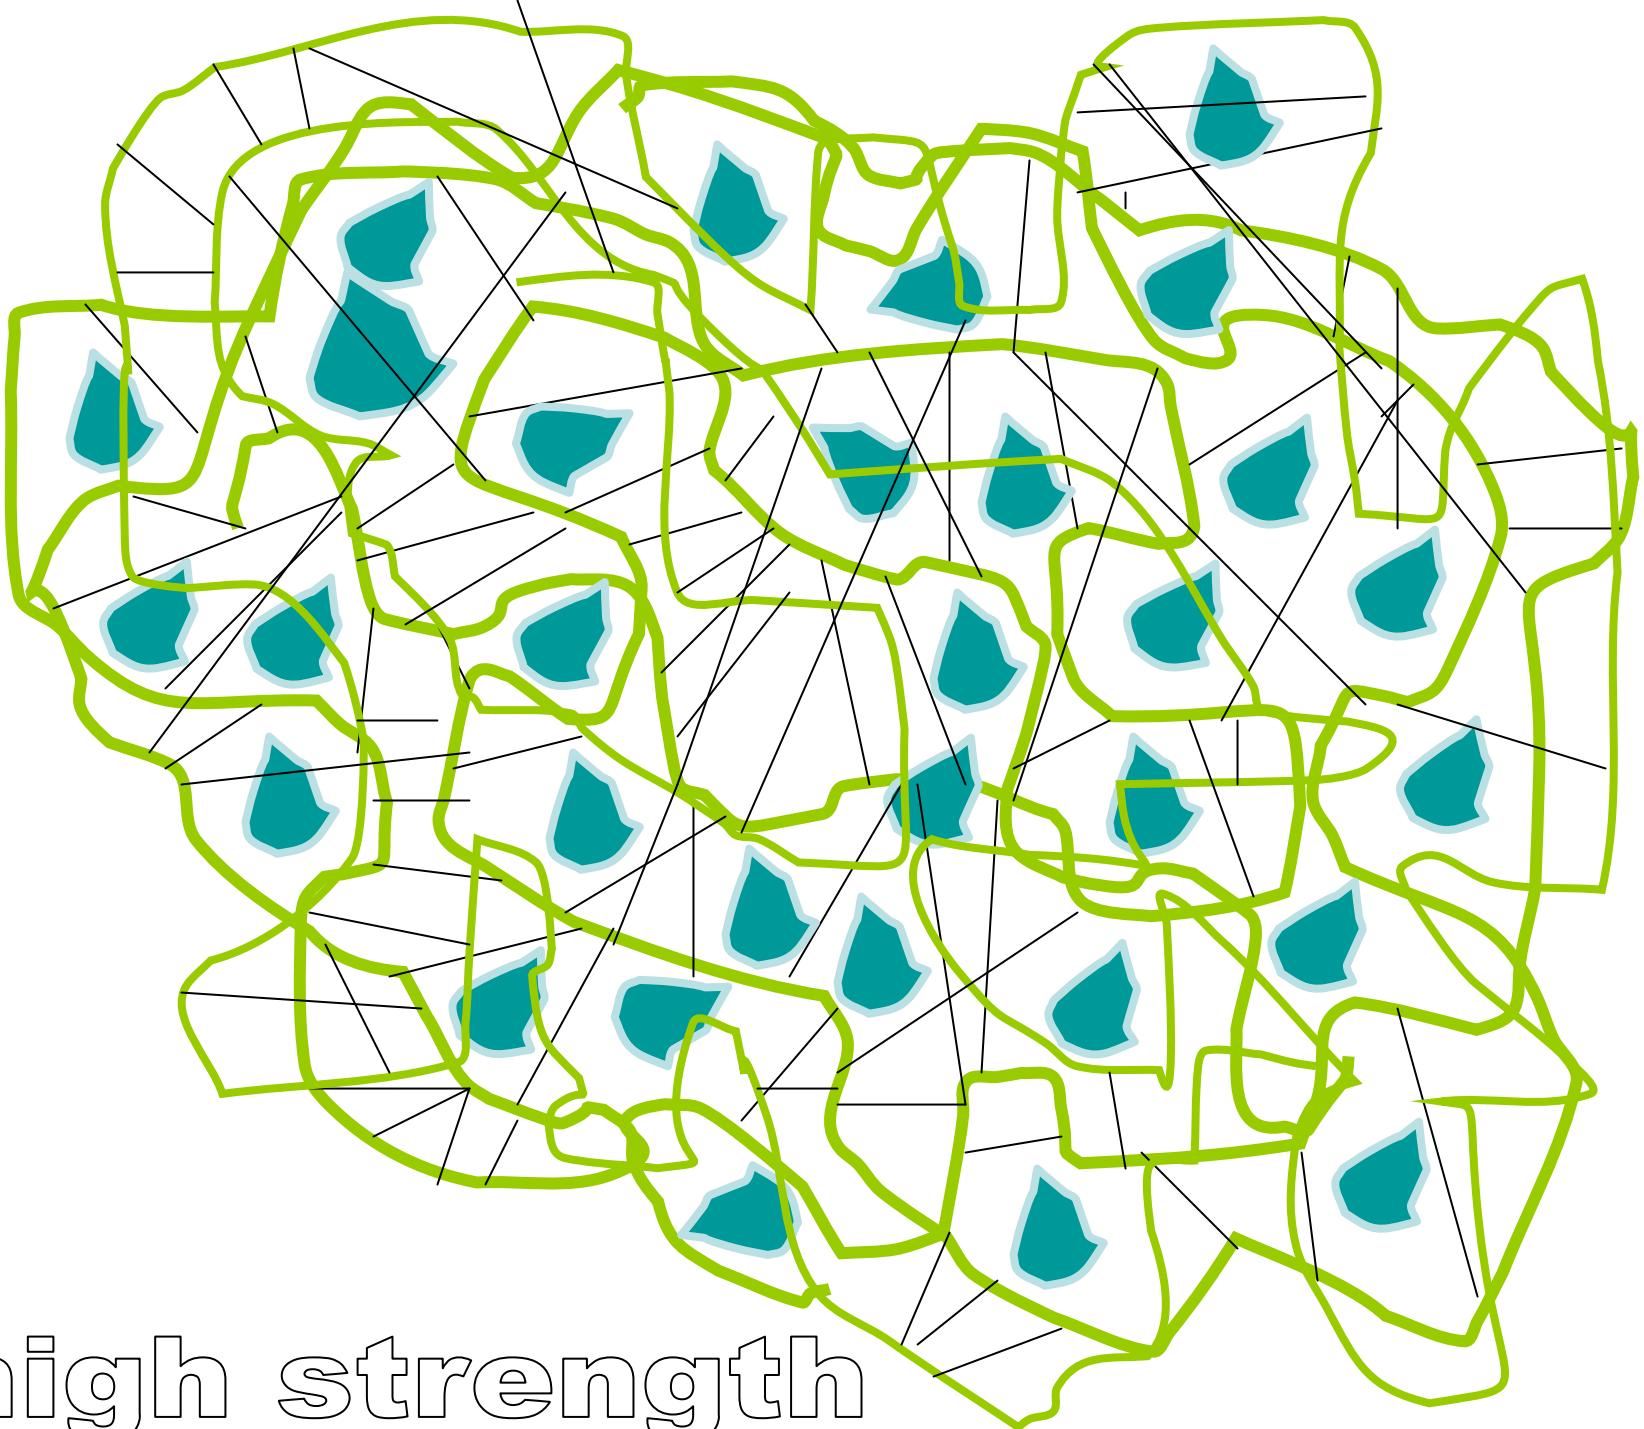

dentin

resin modified

high strength

GIC – indication

- Class V, small class I., class III.
- Base – sandwich fillings
- Luting cements
- Root canal filling

Glasionomers

- Hand mixed

Check the mixing ratio – the drop without any bubbles

- Power mixed - capsulated– aktiovation of a capsula

Forceps fo activation, forceps for application
