# Topic P08: Laboratory diagnostics of tuberculosis, actinomycosis and nocardiosis

To study: Mycobacterium, Actinomyces, Nocardia (from textbooks, www etc.)

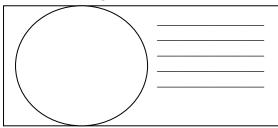

From spring term: Microscopy, culture, antibiotic susceptibility, PCR

### Task 1: Microscopy of acid-fast and partially acid-fast microoorganisms

While entirely acid-fast microorganisms (*Mycobacterium*) cannot be stained at all according to Gram, only partially acid-fast ones (*Actinomyces, Nocardia*) can be Gram-stained, but they stain irregularly; they also tend to form branched filaments.

### a) Staining of (negative) clinical material using Ziehl-Neelsen staining method

Ziehl-Neelsen staining is used for mycobacteria (*M. tuberculosis, M. leprae*) and also for some parasites (*Cryptosporidium parvum*, *Cyclospora cayetanensis*). The acid-fast organisms are stained only when heated during staining\*, but then they are not decolorized even by so-called "acid alcohol" (mixture of alcohol with HCl or H<sub>2</sub>SO<sub>4</sub>). Decolorized background is then counterstained by a different dye.

Stain the negative sputum according to the Ziehl-Neelsen

method (methylene blue variant). The presence of acid-fast rods is unlikely. Observe in the microscope (immersion). Draw the results; you will see mainly the background, e.g. leucocytes, epithelia and other objects. Do not forget to **describe** your picture (use the lines)!

Describe also the staining procedure – fill in the following table with the names of the used reagents.

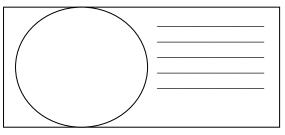

Describe also the stanning pro	vectorie this in the following table with the names of the asea reagents.				
1.	During the staining the preparation is until		until		
2.	This reagent consists of		and		
3.	Instead of this reagent, it is	also possible to use			

#### b) Microscopy of a mycobacterial culture

Examine microscopically (immersion 100× objective) the preparation from a mycobacterial culture stained by Ziehl-Neelsen staining method.

Evaluate the presence of red acid-fast rods. Draw the observed structures.

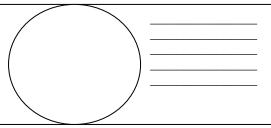

Do not forget to **describe** your picture (use lines)!

## c) Microscopic examination of actinomycetes and nocardia strains

Examine microscopically the Gram-stained slide. Describe and draw the observed objects. Notice high polymorphism of the microorganisms (from cocci through rods to filaments, often branched; Gram-positive, but in many cases staining partially Gram-negative).

Do not forget to **describe** your picture (use lines)!

### Task 2: Mycobacteria, Actinomyces and Nocardia cultivation

The culture requirements of acid-fast and partially acid-fast bacteria are very different.

- ❖ For *Mycobacterium tuberculosis*, we use special media: in the CR liquid Šula medium and solid media Ogawa and Löwenstein-Jensen. The solid media are different from the majority of other solid media used in medical microbiology: they do not contain agar, they are "solid" because of coagulated egg proteins. Before culturing, the examined specimens should be rid of other microbes, usually by NaOH.
- For *Nocardia*, common blood agar is sufficient.
- For *Actinomyces*, we need anaerobic agar (e.g. VL agar) and culture in anaerostat/anaerobic jar (see P07), as these organisms are anaerobic (or microaerofilic, but with very low need for oxygen).

<sup>\*</sup>Heating may be substituted by using highly concentrated both carbolfuchsine and phenol; this Kinyoun modification of Ziehl-Neelsen staining does not require heating.

### Task 4: PCR in the TB diagnostics

As the culture of mycobacteria is rather prolonged (on average 6 weeks), PCR becomes a very important method in the diagnostics of TB.

Read a result of PCR TB diagnostics (from the slideshow), write down the results and interpret them.

Patient No.	Sample band	Control band	Interpretation
1			
2			
3			
4			

### Task 5: Diagnostics of leprosy

Leprosy is a disease that still affects millions of people in underdeveloped countries. Its laboratory diagnostics is difficult because *Mycobacterium leprae* does not grow on artificial media. Fill in the following table.

The name of this animal is	
It is used to produce	
and this substance is used for	

Picture source: http://www.1-costaricalink.com/costa\_rica\_fauna/nine\_banded\_armadillo.htm

### Task 6: Indirect TB detection by means of QUANTIFERON<sup>©</sup>-TB Gold test

It is a test of induced interferon gamma release checking and by means of this, checking of the cell-mediated immunity. **Test principle:** It was proven that in TB, including latent TB, tuberculosis antigens activate T-lymphocytes and they produce big amounts of interferon gamma. Similarly those T-lymphocytes may be activated non-specifically by so called mitogenem; that is why mitogene is used as a positive control (MIT). As a negative control we use a test tube containing nothing (NIL). The test tube with proper TB antigen is labeled "TB". Interferon itself is detected by ELISA reaction.

Interpret the Quantiferon-TB Gold examination in four patients with use of interpretation table.

Anna:	MIT = 4.8	TB = 1.2	NIL = 1.1	Your interpretation:
Berta:	MIT = 5.3	TB = 4.8	NIL = 2.1	Your interpretation:
Cecil:	MIT = 0.9	TB = 0.9	NIL = 0.8	Your interpretation:
Dimos:	MIT = 8.4	TB = 8.3	NIL = 8.2	Your interpretation:

(all values are in IU/ml)

**Interpretation table (according to test recommendations; simplified!)** 

NIL	TB minus NIL	MIT minus NIL	Final test interpretation	Presence of infection <i>M. tuberculosis</i>
	< 0.35	≥ 0.5	negative	Not likely
$\leq$ 8,0	≥ 0.35	any value	positive	Likely
	< 0.35	< 0.5		Commot be determined
> 8,0	any value	any value	unsure	Cannot be determined
