Prosthetics I.

Rehabilitation of the masticatory apparatus

Damaged teeth – reconstruction of the crown

Missing teeth - appropriate prothesis (denture)

Function of dentition

Food admission Trituration (comminution) of food

Fonation

Aesthetics - psychology

Iroubalikova@gmail.com

Consequence of not treated dentition – malfunction of dentition

- Insufficient comminution of food digestive disorders irritation, diseases of the digestion apparatus.
- Disorders of fonation
- Alteration external appearance (teeth support soft tissues, keep intermaxillary relations)
- Psychological aspect of lost teeth (sign of health, good social position, self-realization)

Prothesis – prosthetic treatment

- Dentures are individually made
- Diferences
- in the type of defect, extent and location
 in the size, shape and position of teeth
 in the quality of hard and soft tissues of
- the oral cavity
- > in intermaxillary relations

Aim of prosthetic treatmnt

Rehabilitation of:

Function
Comfort
Aesthetics
Fonation

Fixed dentures

Cemented on the teeth or implants – inlays, crowns, bridges,

Removable dentures

PartialComplete (full)

Procedures

 \succ In dental surgery > In dental laboratory > Special instruments > Basic (main) materials (metal alloys, ceramics, polymers) > Auxilliary (accessory) materials (impression, carving, models, insulating investing, grinding, polishing)

Manufacturing of dentures

Model of gypsum (plaster) – model of a denture (wax pattern).

Model of a denture (wax pattern) directly in the mouth – rarely.

Denture is formed without a wax pattern in the dental lab.

Planning of the denture

Complex examination

- 1. Extent and location of the defect
- 2. Damage of the involved teeth (caries, fillings atc.)
- 3. Periodontium
- 4. Shape, size, position of teeth, relationhip to the neighbours
- 5. Occlusion, articulation relationship to the antagonists
- 6. Quality of the alveolar process
- 7. The level of oral hygiene
- 8. X-ray examination
- 9. Study impressioons study models
- 10. Detail evaluation of the abutment teeth (pilots) most important teeth –canines, premolars

Classification of pilots (abutment teeth)

Pilots I. class Canines Molars (1st, 2nd)

Classification of pilots (abutment teeth)

Pilots II. st class Incisors - maxillary incosors, pemolars

Classification of pilots (abutment teeth)

Pilots III. class Mandibular incisors, third molars, all teethe with bad biological factor

Biological factor

Caries > Pulp vitality > Level of the endodontic treatment > Level of the resorption of the alveolar bone ➢ Periodontium Relationship to antagonists Relationship to neihgbour teeth

Way of the transfer of masticatory forces

Tooth Tooth and oral mucosa Oral mucosa

I. Class One or more teeth are missing Small gaps -1 - 2 teeth Big gaps 3 - 4 teeth at most. This big gaps must be demarcated by pilot of the best quality. (canine, 1st or second molars – pilots of 1st class or their equivalents)

II. Class Reduced dental arch, thenlast tooth is the second molar.

With gaps Without gaps Bilateral Unilateral

III. Class

Individual teeth or small groups of teeth

IV. Class

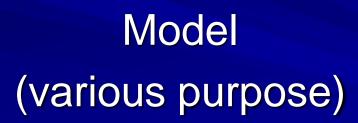

Edentulous dental arch

Manufacturing of dentures

Model of gypsum (plaster) – model of a denture (wax pattern).

Impressions of the jaw - negativ

The impression is filled with a casting material (gypsum) – poured into

Models

Working model – the denture is produced on this model (special procedures)

> Opposing model (antagonal) - necessary for the recognition of intermaxillary relationship

Study model – for study purposes (planning dentures, orthodontics etc.)

Impressions

Impression of the dental arch (where we intend replacement of teeth)

Impression of opposite dental arch

Registration of intermaxillary relationship

Manufacturing of dentures

The denture is made on the working model.

This is an indirect method.

Indirect method requires impression.

Manufacturing of dentures Indirect method

Indirect method requires taking impression. The denture is made in dental laboratory.

Manufacturing of dentures

The denture is made without any impression

This is direct method

Direct method does not require impression

lenka.roubalikova@tiscali.cz

Manufacturing of dentures Direct method

No impression The model of the denture is made directly in the mouth (of special wax or resin) For some cases only

CAD CAM method

The denture or its part is made using special devices.

The treated area is scanned directly in oral cavity or on a model (SCANNER) The denture is planned in computer The denture (or its part) is made by computer assisted procedure – cutting or sintering (SPECIAL DEVICE – MILLING MACHINE OR SINTERING MACHINE)

Crown and its cementation

Root canal inlay and crown

lenka.roubalikova@tiscali.cz

Bridge

Removable partial dentures, complete dentures

lenka.roubalikova@tiscali.cz
