Intracranial compartment, Cellular base of nervous system

2 Intracranial compartment, Cellular base of nervous system

Compartmentalization

- Cellular specialization leads to compartmentalization on several levels
 - Tissue level
 - Organ level
 - Organ system level
- There are barriers in between compartments
- Properties/content may vary among different compartments

Compartmentalization

els

 $M \in D$

- Tissue level
- Organ level —
- a narrow range thanks to hematoencephalic barrier and astrocyte activity Organ
- There are ullet

CNS lymphatic drainage

- Cervical lymph nodes
 - Nasal lymphatics
 - Dural lymphatics
 - Alongside nerves
 - Alongside vessels (no
- Lumbal lymph nodes

15

• Alongside nerve roots

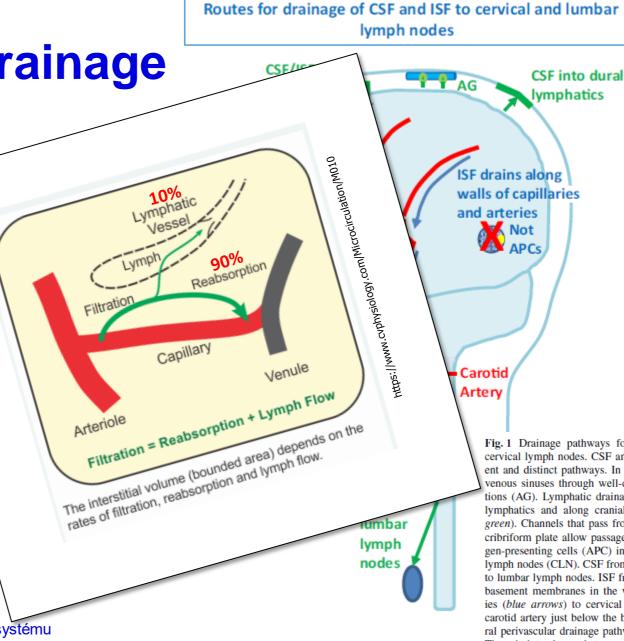

Fig. 1 Drainage pathways for CSF and interstitial fluid (ISF) to cervical lymph nodes. CSF and ISF drain to lymph nodes by different and distinct pathways. In humans, CSF drains into the blood of venous sinuses through well-developed arachnoid villi and granulations (AG). Lymphatic drainage of CSF occurs via nasal and dural lymphatics and along cranial and spinal nerve roots (outlined in green). Channels that pass from the subarachnoid space through the cribriform plate allow passage of CSF (green line) T cells and antigen-presenting cells (APC) into nasal lymphatics (NL) and cervical lymph nodes (CLN). CSF from the lumbar subarachnoid space drains to lumbar lymph nodes. ISF from the brain parenchyma drains along basement membranes in the walls of cerebral capillaries and arteries (blue arrows) to cervical lymph nodes adjacent to the internal carotid artery just below the base of the skull. This narrow intramural perivascular drainage pathway does not allow the traffic of APC. There is interchange between CSF and ISF (convective influx/glymphatic system), as CSF enters the surface of the brain alongside penetrating arteries

Background Activity

https://upload.wikimedia.org/wikipedia/commons/e/ed/Neuron_Cell_Body.png

Background Activity

MUNI MED

Background Activity

Fast axonal transport

- bidirectional
- ATP dependant
- associated with microtubules:

dynein and kinesin

Fast axonal transport

31

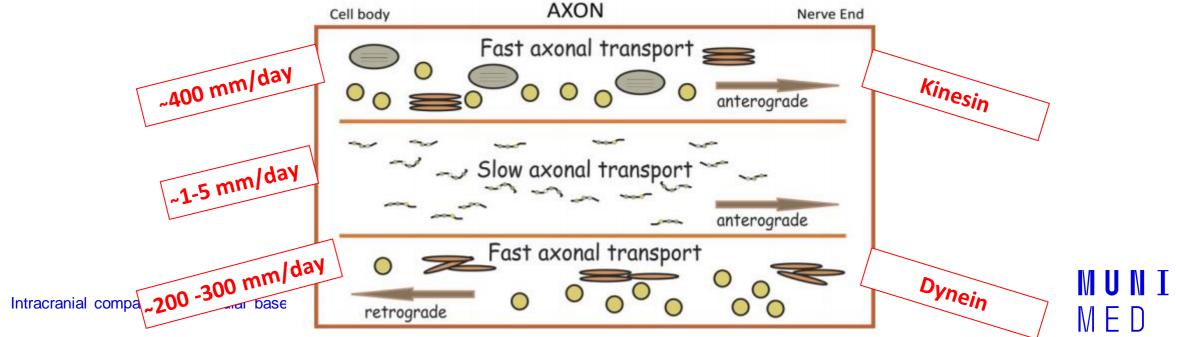

Golgi derived vesicles lysosmes, mitochondria structural elements of endoplasmic reticulum

Slow axonal transport

- unidirectional,
- ATP independant
- conducted by sliding, polimerizing and protein interacting

Slow axonal transport

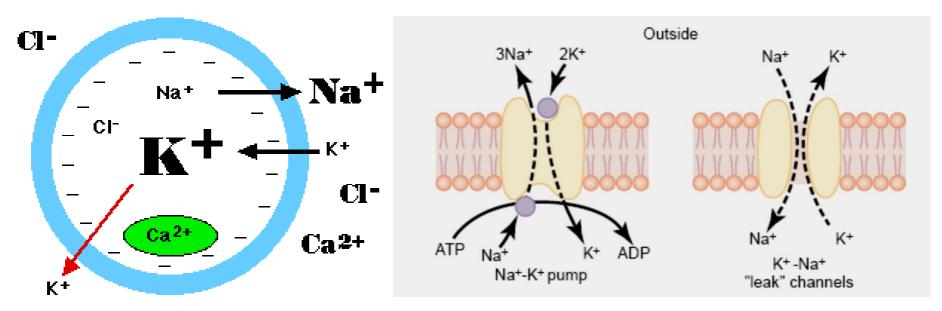

microfilaments, microtubules neurofilaments cytosolic protein complexes

http://www.oapublishinglondon.com/images/article/pdf/1397255957.pdf

Membrane potential

• Due to differences in the concentrations of ions on opposite sides of a cellular membrane

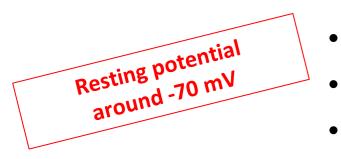

http://www.slideshare.net/drpsdeb/presentations

MED

Resting membrane potential of a neuron

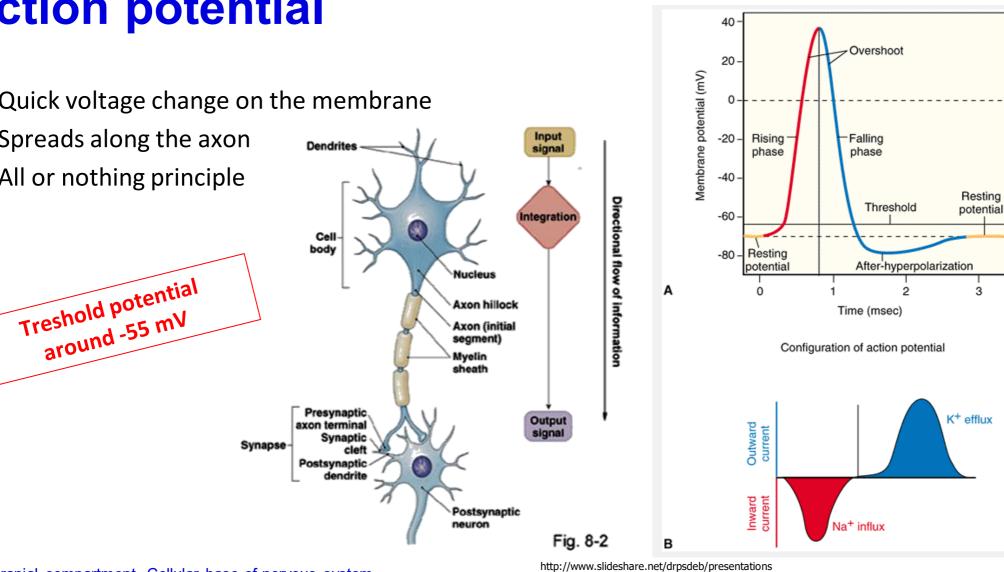

- Highly instable state of membrane
- Why? Speed!
- High energetical demands
 - ✓ Oxygen 20% of total body consumption
 - ✓ Glucose 25% of total body consumption

MED

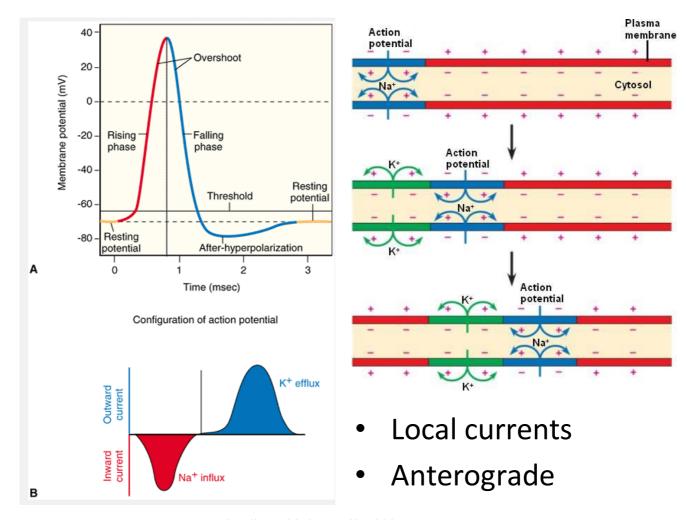

Action potential

- Quick voltage change on the membrane •
- Spreads along the axon •
- All or nothing principle ۲

MUNT MED

Action potential spreading

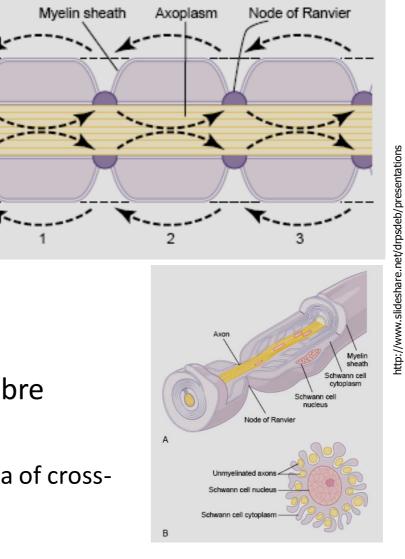

http://www.slideshare.net/drpsdeb/presentations

MUNI MED

Saltatory conduction

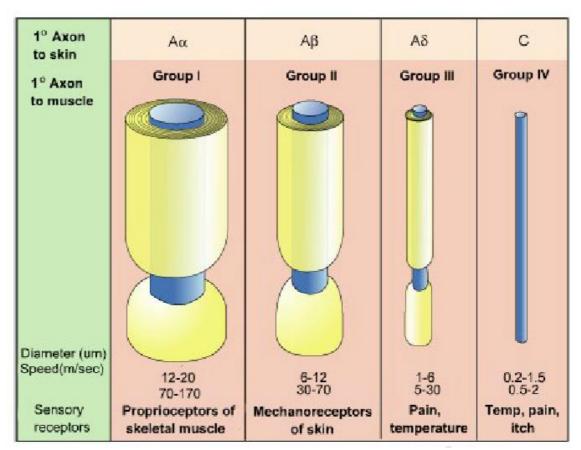

- Myelin sheat
- Nodes of ranvier
- Economy
- Speed of conduction
- Speed of conduction also dependent of nerve fibre diameter
 - the electrical resistance is inversly proportional to area of crosssection

 $M \vdash D$

Classification of nerve fibers

- In humans mostly myelinated
- All fibers are myelinated in CNS
- Non-myelinated are evolutionary old ones

http://neuroscience.uth.tmc.edu/s2/chapter04.html

Neuronal classification

Basis for classification	Example	Functional implication	Structure
3. Number of processes One process exits the cell body	Unipolar neuron (dorsal root ganglion cell)	Small area for receiving synaptic input: highly specialized function	Unipolar
Two processes exit the cell body	Bipolar neuron (retinal bipolar cell)	Small area for receiving synaptic input: highly specialized function	Bipolar Multipolar
Many processes exit the cell body	Multipolar neuron (spinal motor neuron)	Large area for receiving synaptic input; determines the pattern of incoming axons that can interact with the cell	Multipolar

MUNI

MED

Neuronal classification

Basis for classification	Example	Functional implication	Structure
2. Dendritic pattern Pyramid-shaped spread	Pyramidal cell	Large area for receiving	Pyramidal cell
of dendrites	(hippocampal pyramidal neuron)	synaptic input; determines the pattern of incoming axons that can interact with the cell (i.e., pyramid-shaped)	thry.vvv.slideshare.net/CoslineEgri/presentations
Radial-shaped spread of dendrites	Stellate cell (cortical stellate cell)	Large area for receiving synaptic input; determines pattern of incoming axons that can interact with the cell (i.e., star-shaped)	Stellate cell

Neuronal classification

Basis for classification	Example	Functional implication	Structure
1. Axonal projection Goes to a distant brain area	Projection neuron or Principal neuron or Golgi type I cell (cortical motor neuron)	Affects different brain areas	Dorsal root ganglion cell
Stays in a local brain area	Intrinsic neuron or Interneuron or Golgi type II cell (cortical inhibitory neuron)	Affects only nearby neurons	Retinal bipolar cell
