Image analysis I

C9940 3-Dimensional Transmission Electron Microscopy S1007 Doing structural biology with the electron microscope

March 2, 2015

Syllabus, original

Week	Date	Instructor	Topic
1	02/16	D. Nemecek & T. Shaikh	Introduction/Tour/History
2	02/23	D Nemecek & T Shaikh	Electron Optics
3	Q 3/02	D. Nemecek	Specimen preparation
4	03/09	T. Shaikh	Image analysis I
5	03/16	T. Shaikh	Image analysis II
6	03/23	T. Shaikh	3D reconstruction
7	03/30	T. Shaikh	Single-particle reconstruction
			(Easter)
8	04/13	D. Nemecek	Tomography I
9	04/20	D. Nemecek	Tomography II
10	04/27	D. Nemecek	Visualization/Segmentation
11	05/04	D. Nemecek	Hybrid methods
40	05/44	T. Chailth	Camanutan maatiaala

Correction/clarification from Feb. 16

Correction/clarification

First Siemens microscope, 1939

http://ernst.ruska.de

First <u>commercial</u> EM, 1937 Metropolitan-Vickers EM1 (EM2 shown)

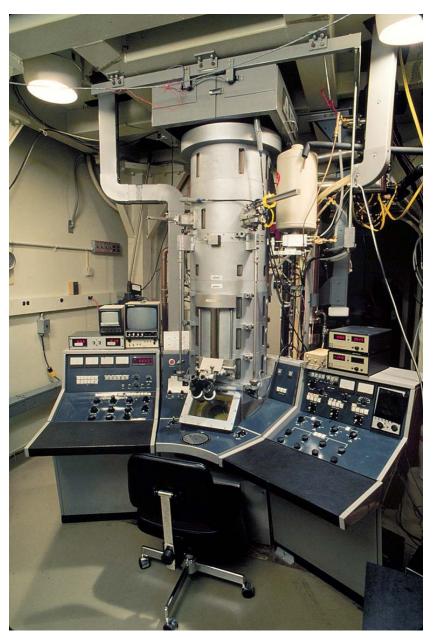

http://emu.msim.org.uk

The first commercial electron microscope was actually by the British company Metropolitan-Vickers in 1937. However, the magnification was worse than for the light microscope, so the Siemens is considered "first."

Metropolitan Vickers eventually became AEI, which built a 1.2 million volt EM-7.

Relevance of Fourier transforms to EM

Fourier transform ~ diffraction pattern see John Rodenburg's site, http://rodenburg.org $v=\alpha/\lambda$

Fourier series

A Fourier series is an expansion of a periodic function f(x) in terms of an infinite sum of sines and cosines

$$f(x) = \frac{1}{2}a_0 + \sum_{n=1}^{\infty} a_n \cos(nx) + \sum_{n=1}^{\infty} b_n \sin(nx)$$

Fourier transforms: Definition

$$F(k) = \int_{-\infty}^{\infty} f(x)e^{-2\pi i kx} dx$$

f: function which we are transforming (1D)

x: axis coordinate

i: $\sqrt{-1}$

k: spatial frequency

F(k): Fourier coefficient at frequency k

Fourier transforms: Definition

$$F(k) = \int_{-\infty}^{\infty} f(x)e^{-2\pi i kx} dx$$

$$F(k) = a\cos(-2\pi kx) + ib\sin(-2\pi kx)$$

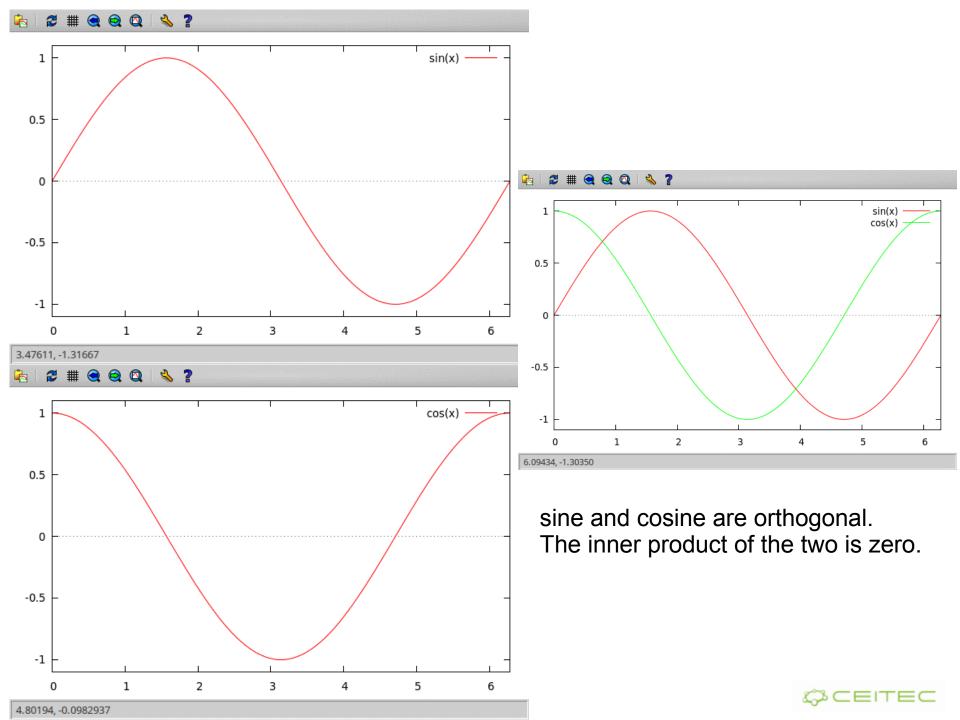

Fourier coefficients, discrete functions

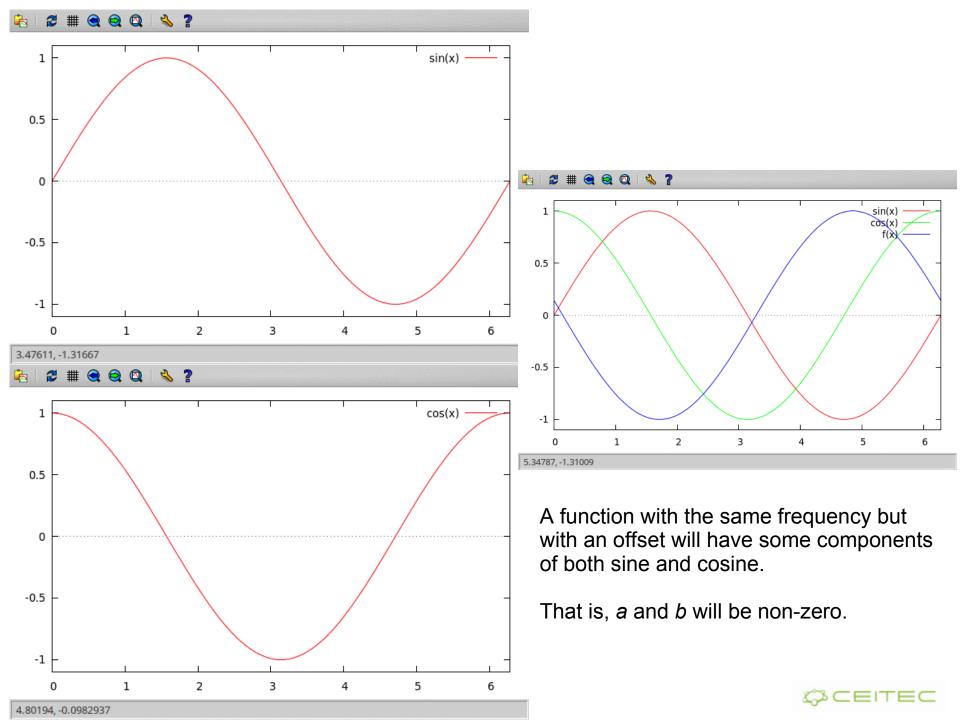

$$f(x) = \frac{1}{2}a_0 + \sum_{n=1}^{\infty} a_n \cos(nx) + \sum_{n=1}^{\infty} b_n \sin(nx)$$

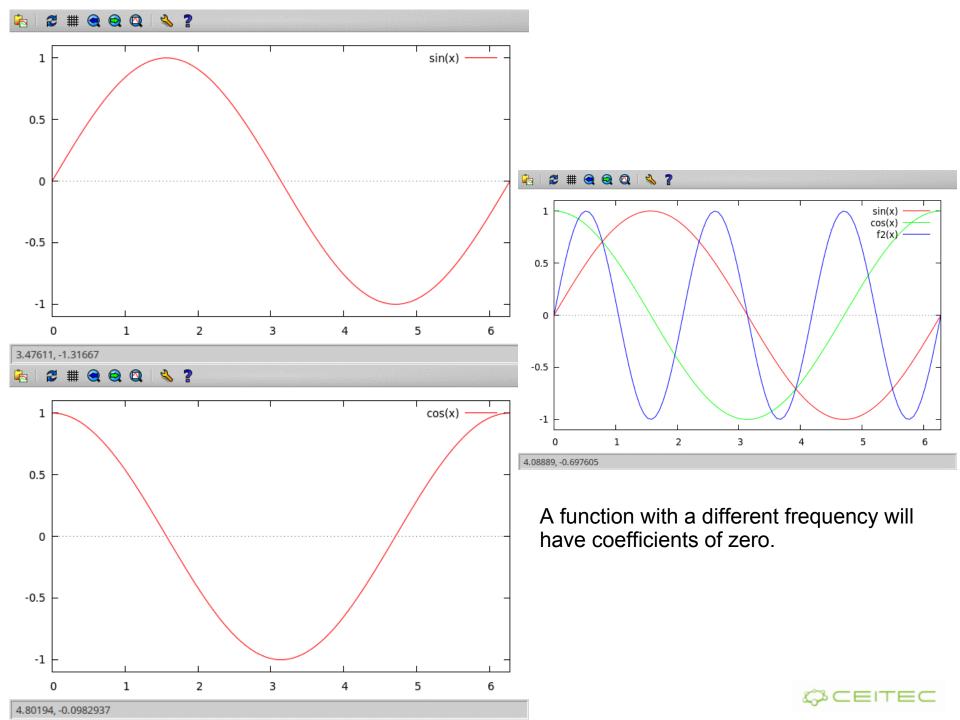

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos(nx) dx$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin(nx) dx$$

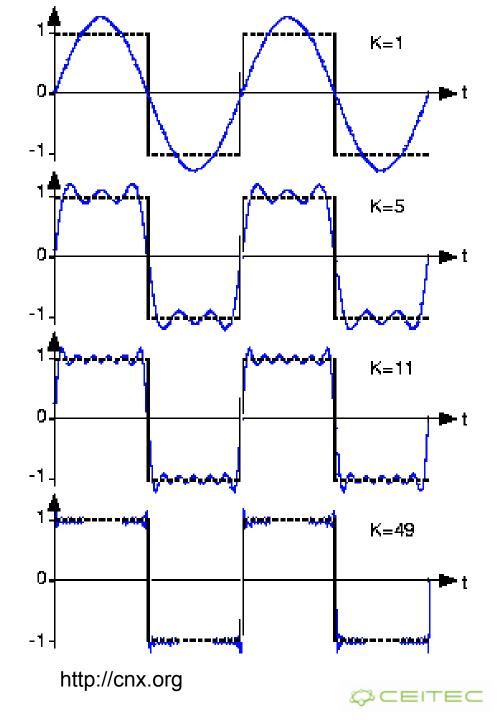

The higher the spatial frequencies (i.e., higher resolution) that are included, the more faithful the representation of the original function will be.

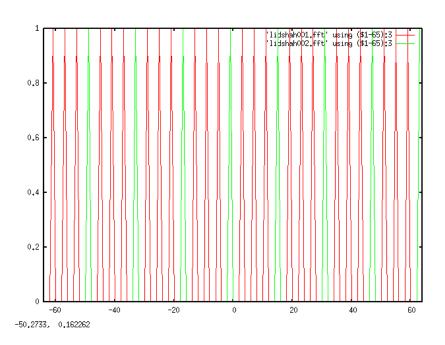

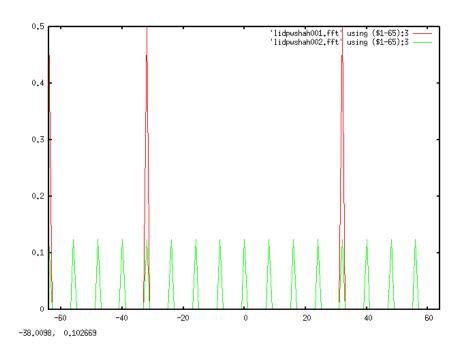

Some properties

- As *n* increases, so does the spatial frequency, *i.e.*, the "resolution."
 - For example, sin(2x) oscillates faster than sin(x)
- Computation of a Fourier transform is a completely reversible operation.
 - There is no loss of information.
- Fourier terms (or coefficients) have amplitude and phase.
- The diffraction pattern is the physical manifestation of the Fourier transform
 - Phase information is lost in a diffraction pattern.
 - An image contains both phase and amplitude information.

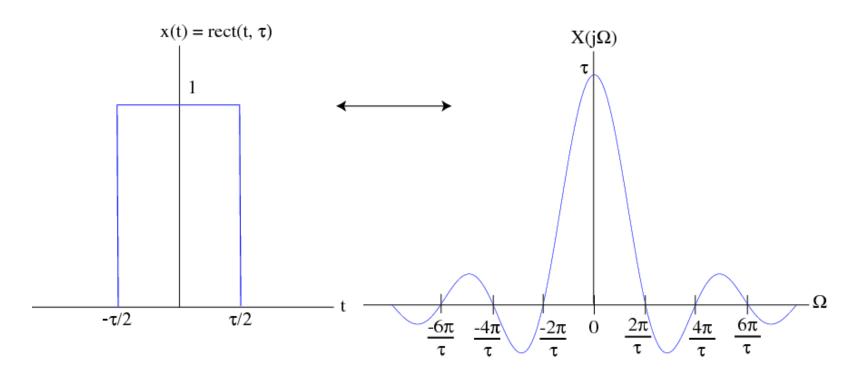

Some simple 1D transforms: a 1D lattice

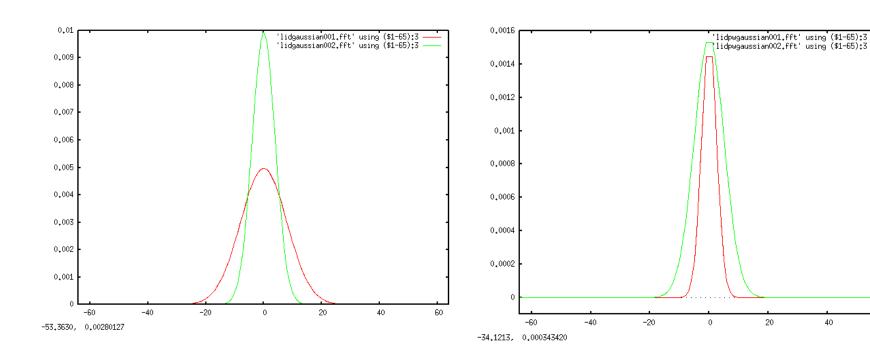

Some simple 1D transforms: a box

http://cnx.org

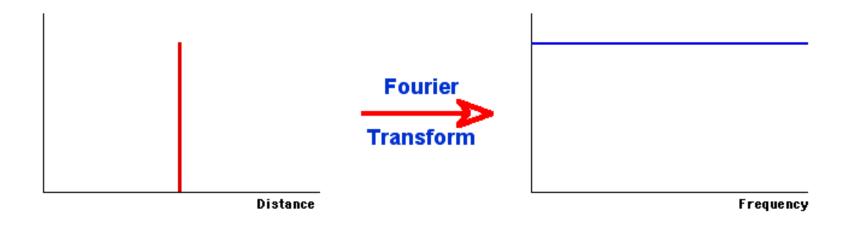

Some simple 1D transforms: a Gaussian

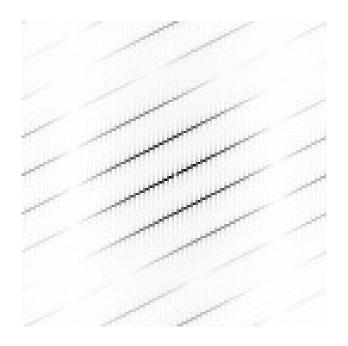

Some simple 1D transforms: a sharp point (Dirac delta function)

http://en.labs.wikimedia.org/wiki/Basic_Physics_of_Nuclear_Medicine/Fourier_Methods

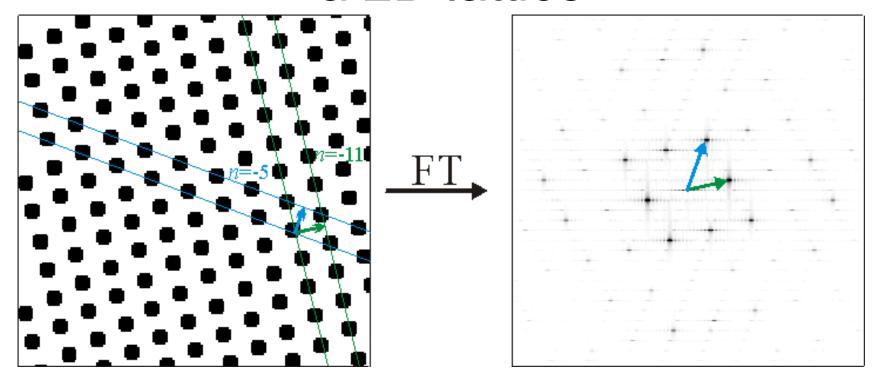

Some simple 2D Fourier transforms: a row of points

Some simple 2D Fourier transforms: a 2D lattice

Some simple 2D Fourier transforms: a sharp disc

Some simple 2D Fourier transforms: a series of lines

What do we mean by spatial frequency?

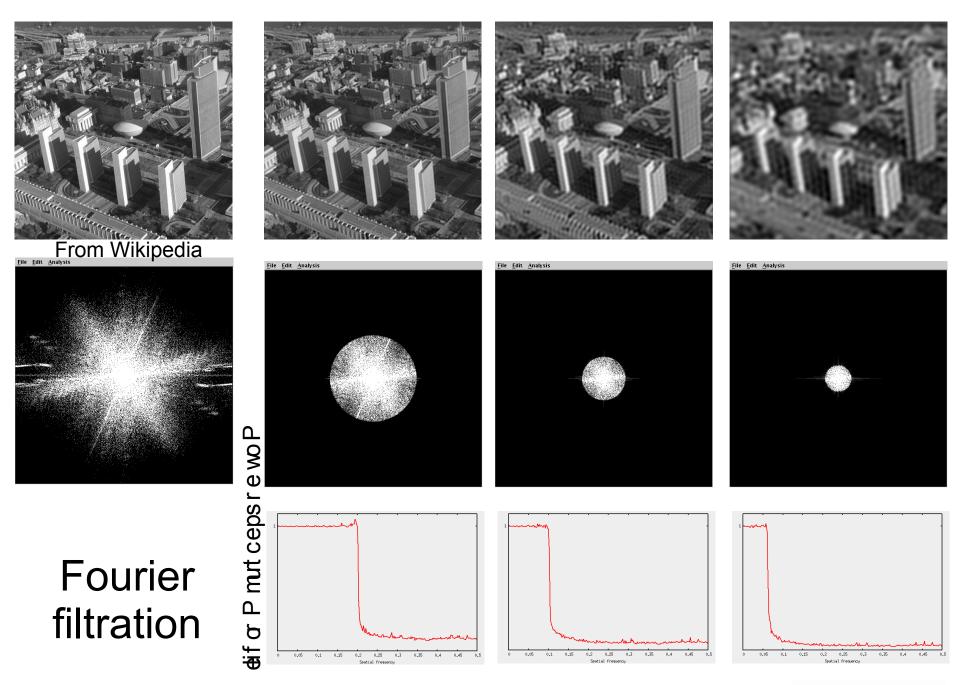

spatial frequen origin

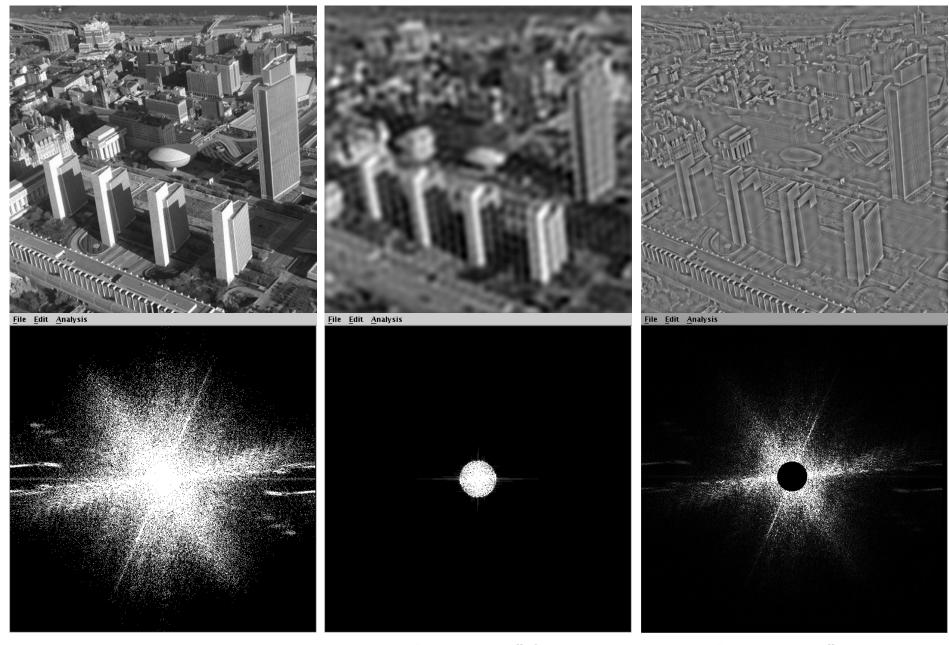

<u>F</u>ile <u>E</u>dit <u>A</u>nalysis

From Wikipedia

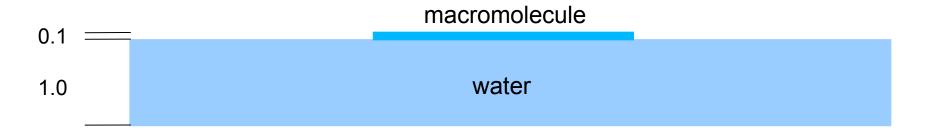

A "low-pass" filter

A "high-pass" filter ⇔⊂≡□≡⊂

Contrast transfer function

Why do we defocus?

Typical amplitude contrast is estimated a 0.08-0.12 (minus noise)

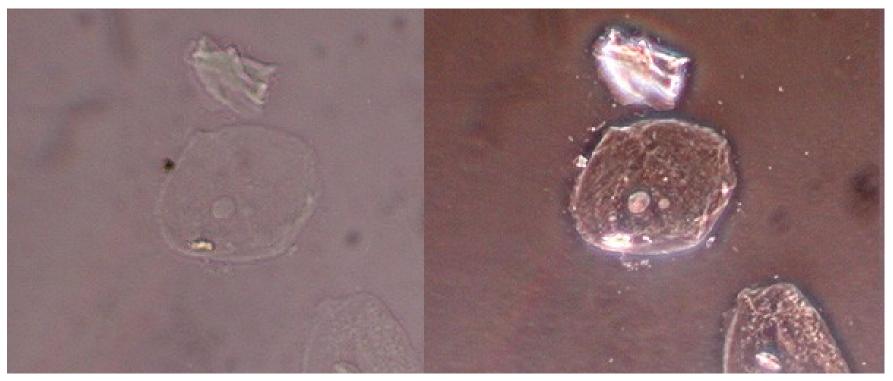

Instead of amplitude contrast, we'll use phase contrast.

Phase contrast in light microscopy

Bright-field image

Phase-contrast image

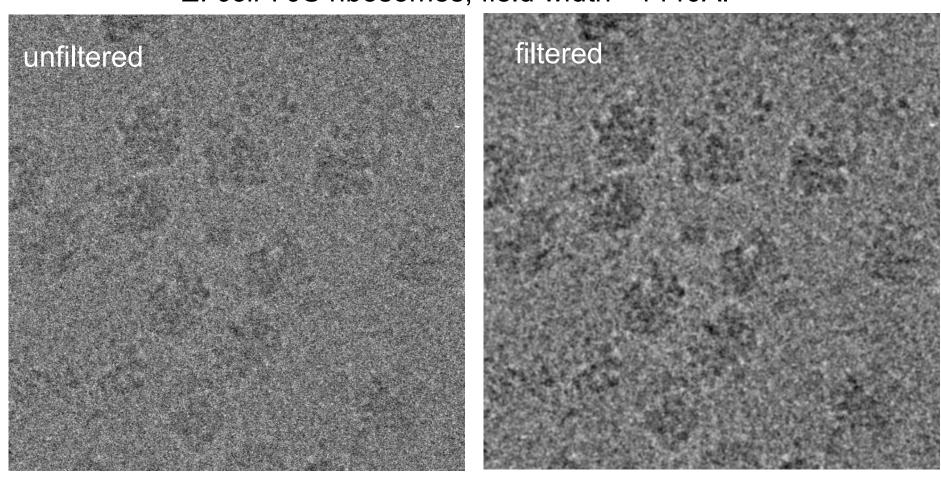

http://www.microbehunter.com

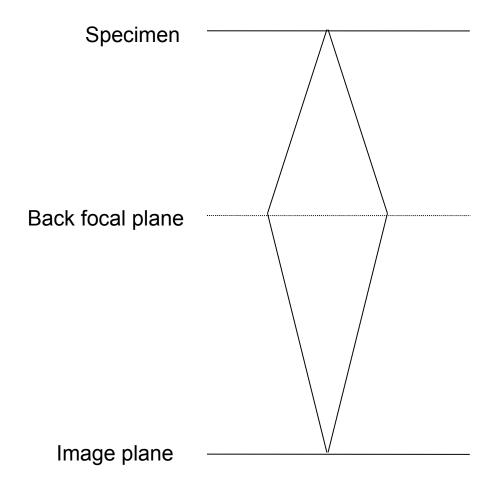

In EM, even with defocus, the contrast is poor.

E. coli 70S ribosomes, field width ~1440Å.

Signal-to-noise ratio for cryoEM typically given to be between 0.07 and 0.10.

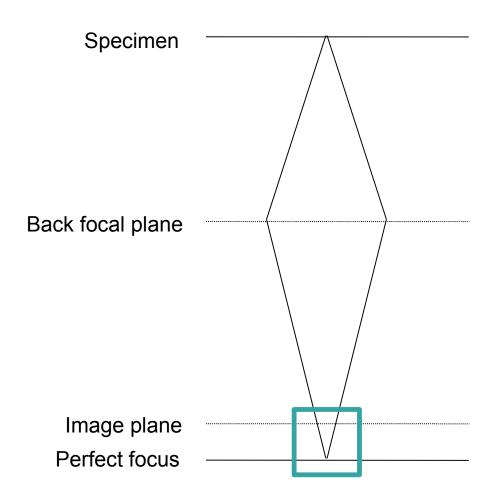

Optical path

At focus, all we would see is amplitude contrast.

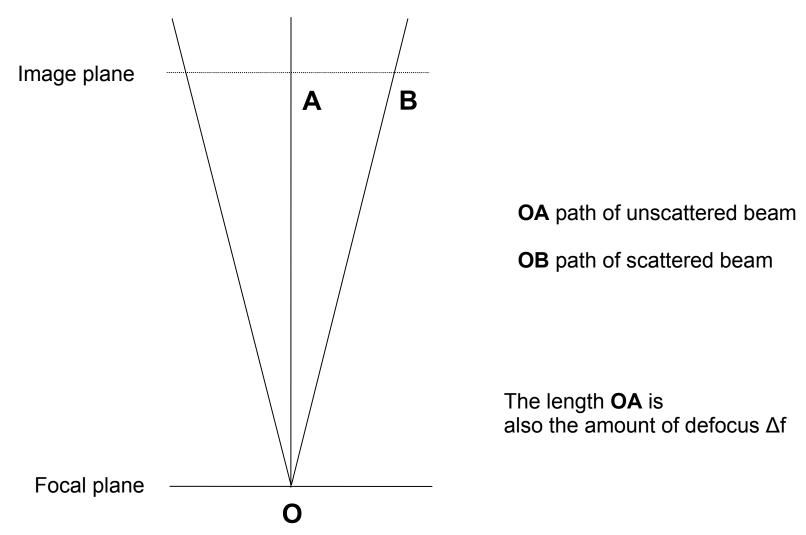

Optical path with defocus

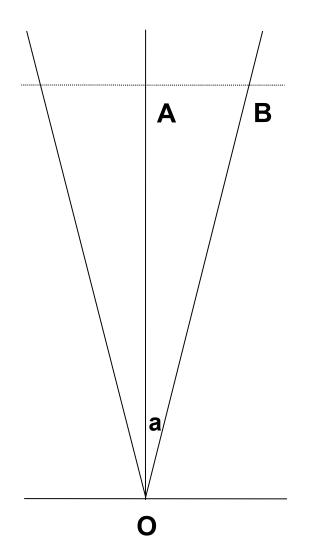

Optical path with defocus

What is the path difference between the scattered and unscattered beams?

Path difference as a function of Δf

$$OB - OA$$

$$OB = OA/cos(a)$$

$$\frac{OA}{\cos(a)}$$
 $-OA$

$$OA \times (\frac{1}{\cos(a)} - 1)$$

Expressed in the number of wavelengths λ

$$OA \times (\frac{\frac{1}{\cos(a)} - 1}{\lambda})$$

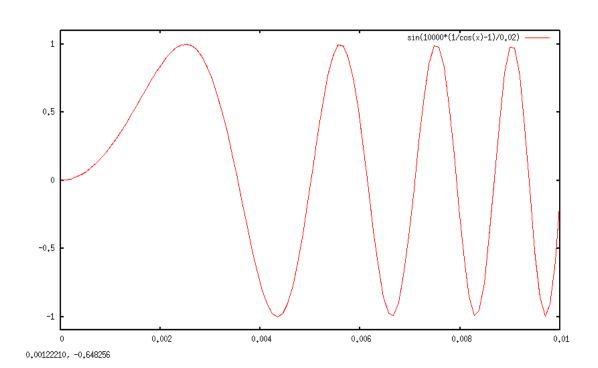

Phase difference is the sine

$$\sin\left(\frac{OA \times \left(\frac{1}{\cos(a)} - 1\right)}{\lambda}\right)$$

Some typical values

$$\sin\left(\frac{OA \times \left(\frac{1}{\cos(a)} - 1\right)}{\lambda}\right)$$

OA =
$$\Delta f$$
 = 10,000 Å
 λ = 0.02 Å
a < 0.01

A more precise formulation of the CTF can be found in Erickson & Klug A (1970). Philosophical Transactions of the Royal Society B. 261:105.

Proper form the CTF

$$-\sin\left(\frac{\pi}{2}C_sk^4 + \pi\Delta f\lambda k^2\right)$$

where:

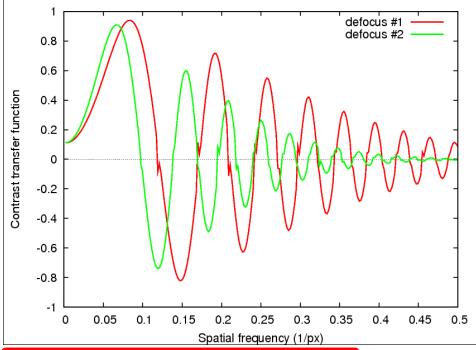

- C_s: spherical aberration
- k: spatial frequency (resolution)

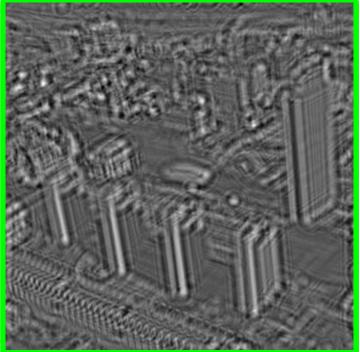

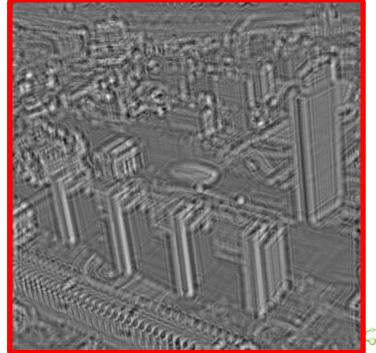

How does the CTF affect an image?

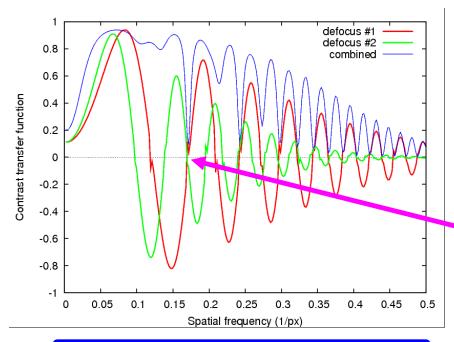

Still a zero present

- Contrast transfer function
- Resolution

How do we evaluate the quality of a reconstruction?

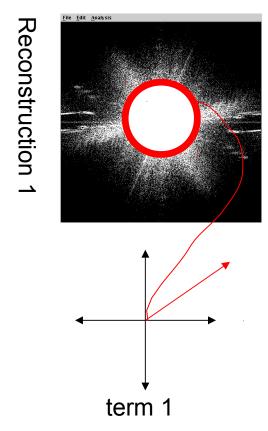

We split the data set into halves and compare them.

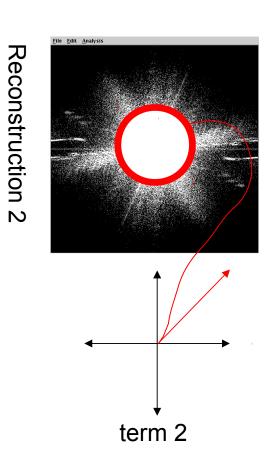

Now, <u>how</u> do we compare the two half-set reconstructions?

Fourier Shell Correlation (FSC)

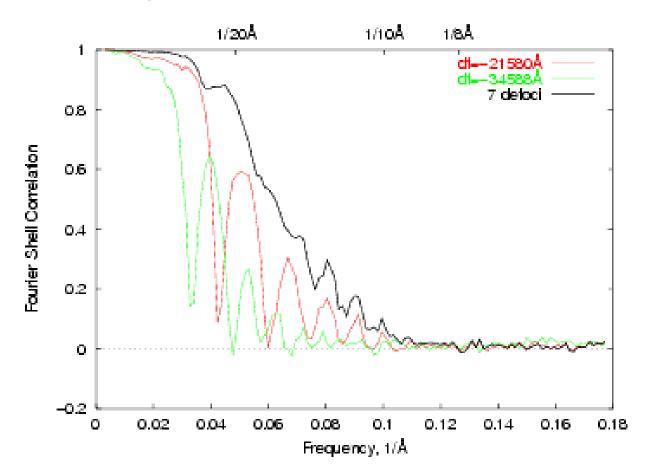

Properties:

- Fourier terms have amplitude + phase.
- Correlation values range from -1 to +1.
- Noise should give an average of 0.
- The comparison is done as a function of spatial frequency (or "resolution")

Fourier Shell Correlation; A better example

It is controversial what single number to use to describe this curve, but a common practice is to report the value where the FSC=0.5 as the nominal resolution.

Thank you for your attention
