

# Isotopologues

Molecules of ISOTOPES have different isotopic composition

<sup>1</sup>H NMR of CH<sub>3</sub>CH<sub>2</sub>OH : consider <sup>1</sup>H, <sup>2</sup>H, <sup>12</sup>C, <sup>13</sup>C, <sup>16</sup>O, <sup>17</sup>O, <sup>18</sup>O

Some isotopologues:

288 isotopic varieties, 192 of which magnetically distinct

These give rise to 184 <sup>1</sup>H spectra, 184 <sup>2</sup>H spectra, 144 <sup>13</sup>C spectra and 96 <sup>17</sup>O spectra, all nontrivial and distinct from each other

The least abundant of these isotopologues is so rare that one would need over 100 moles of ethanol to have any chance to meet one of its molecules, but that can change completely with isotopic enrichment

# Isotopomers

Molecules of ISOTOPOMERS have the same isotopic composition,  
the isotope sits at different positions - isotopic isomers

Some isotopomers:

# Isotope Effects

$$(D/H)^n \Delta(^{13}C)$$

Isotope shift of M signal caused by substitution of H by D, n bonds away

n = 1 primary isotope shift

n = 2 secondary isotope shift

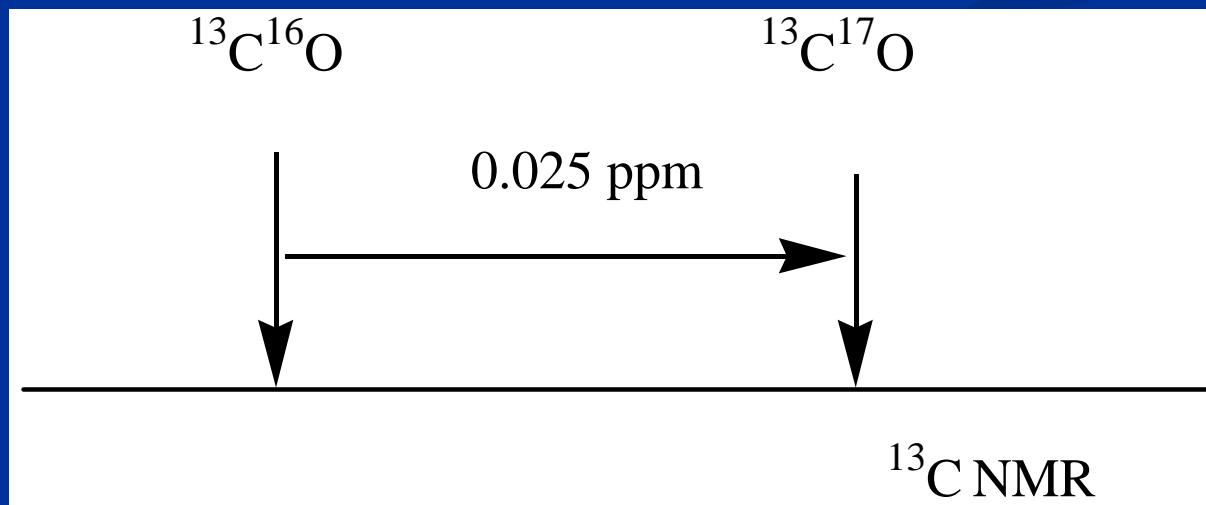

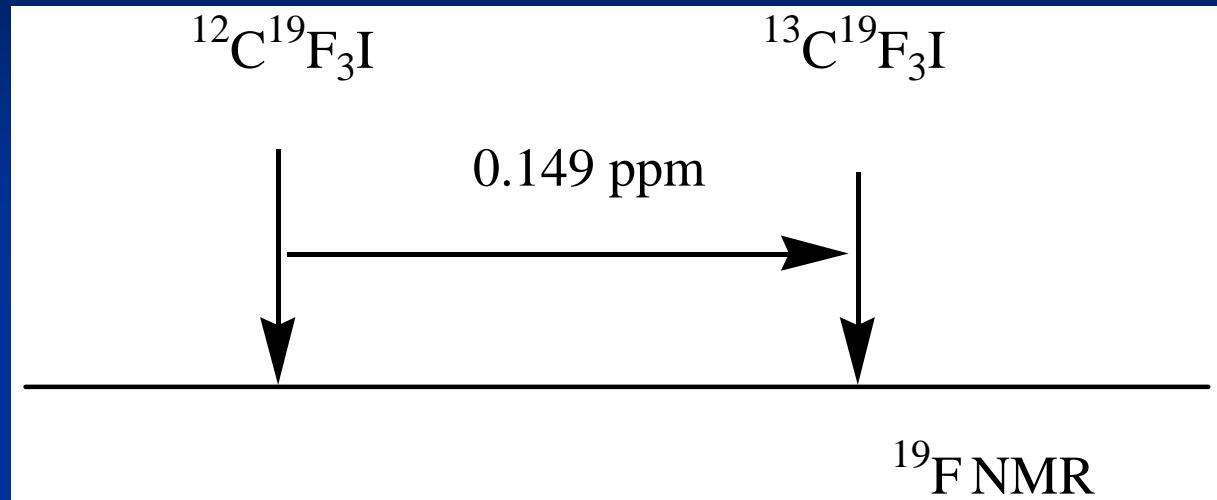

Magnitude expressed in ppb, decreases with longer distance, n

Generally

$$n\Delta(^A M) = \delta_{HEAVY} - \delta_{LIGHT} < 0$$

Heavy isotope shields more

# Isotope Effect

CO bond length  
difference 5 fm

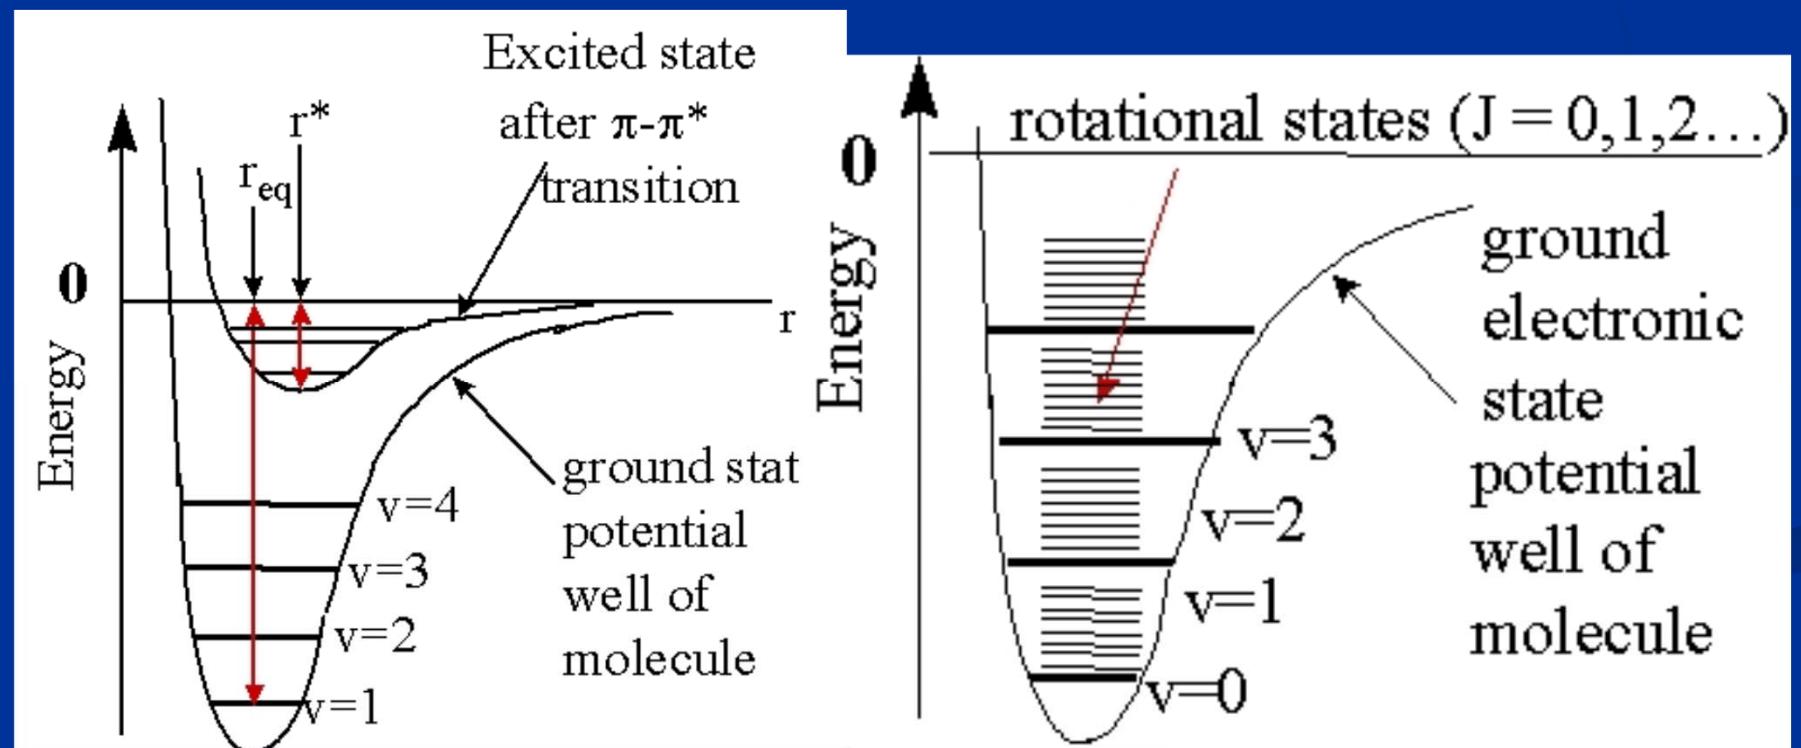

# Isotope Effect

H	D	$(D/H) \Delta(^{31}P)$ ppm
$PH_3$	$PDH_2$	- 0.804
$PH_3$	$PD_2H$	- 0.845
$PH_3$	$PD_3$	- 0.888

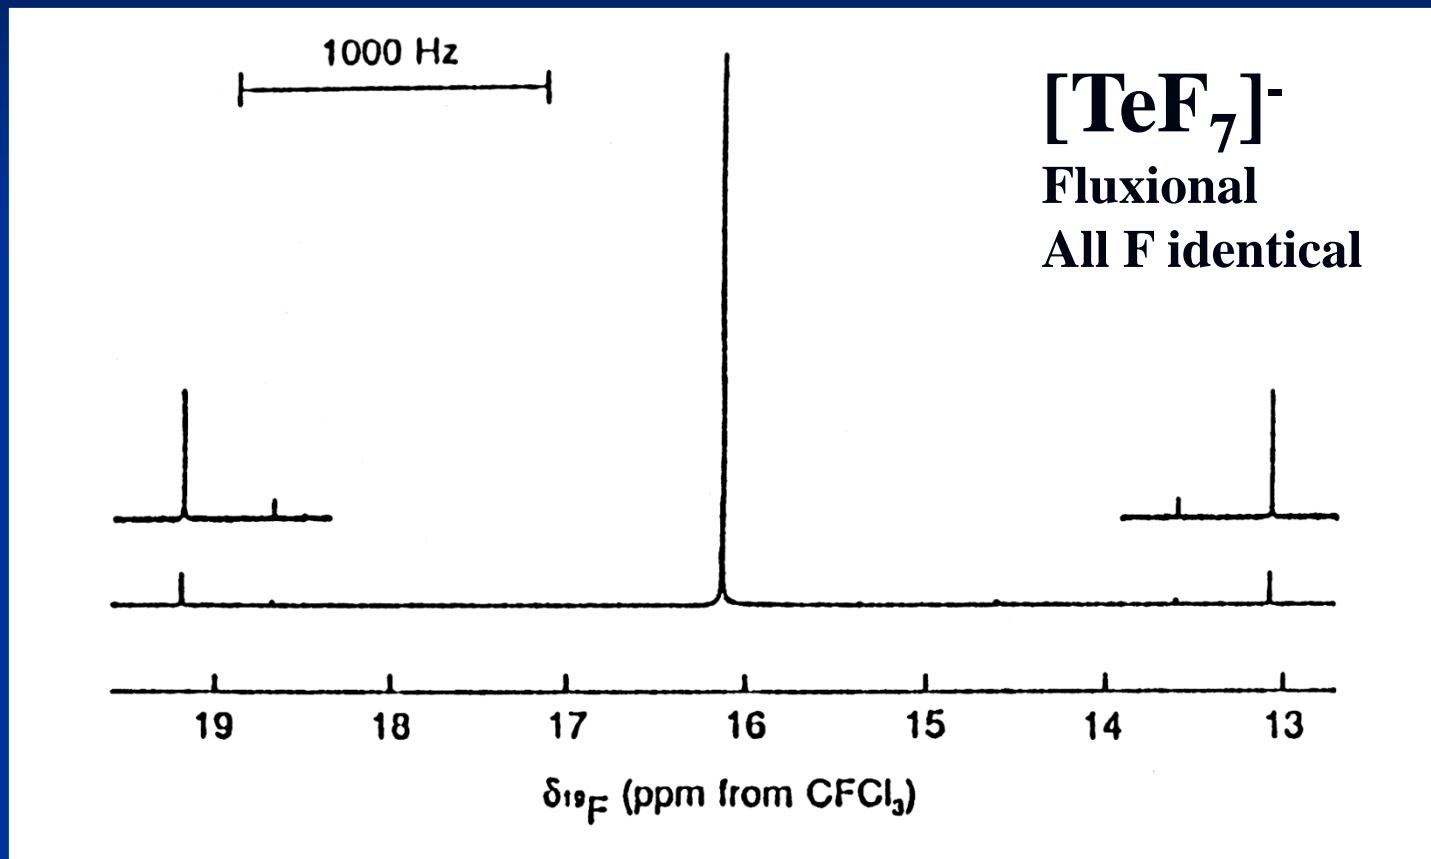

# Isotope Effects

Occupation of vibrational levels changes with temperature

Level spacing changes with mass of bound atoms

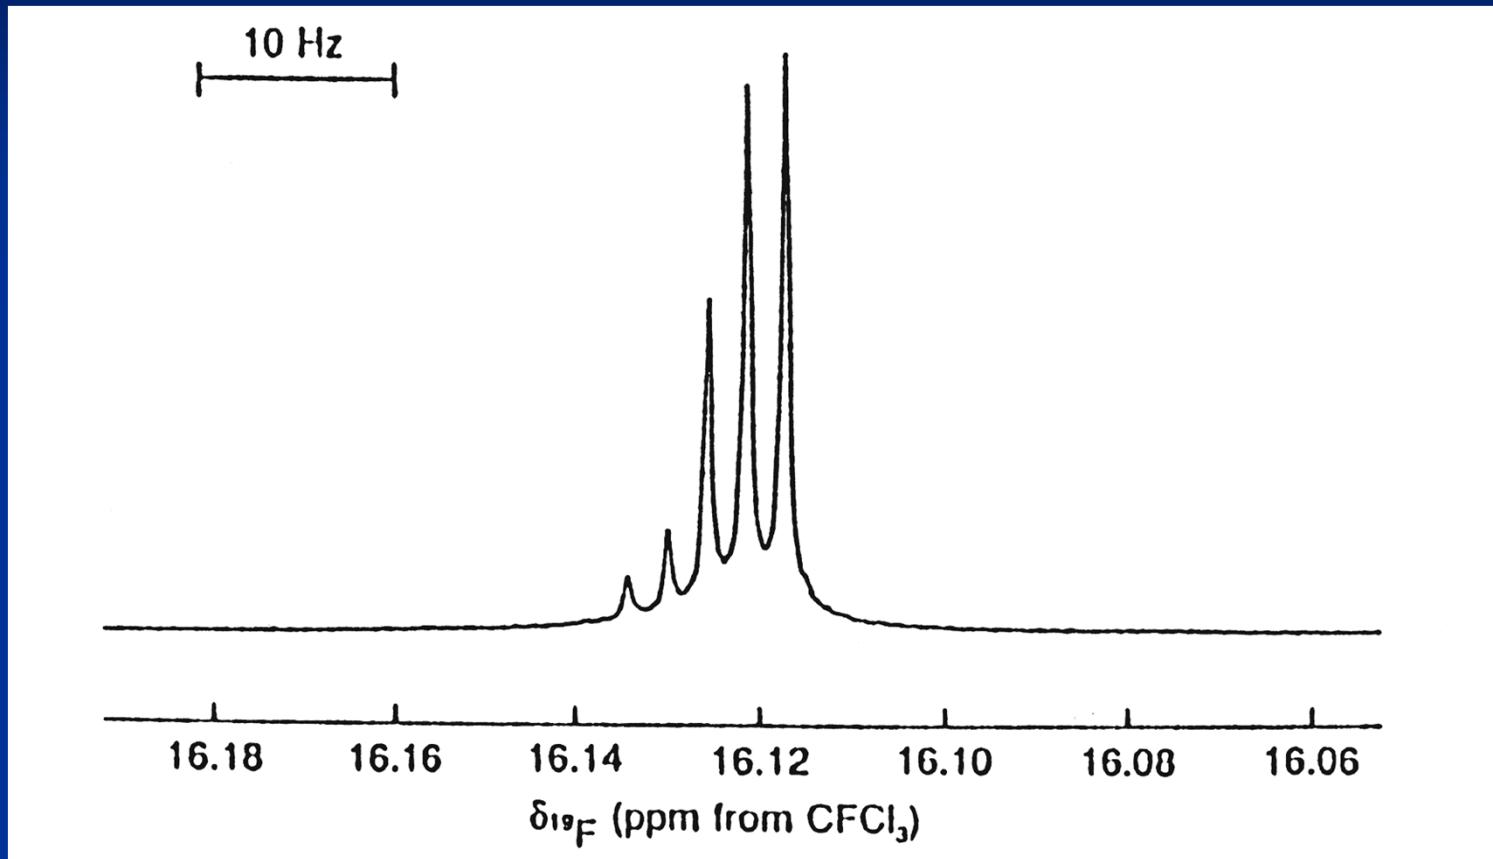

# Isotope Effect

$^{19}\text{F}$  NMR spectrum of  $[\text{NMe}_4][\text{TeF}_7]$  in  $\text{CH}_3\text{CN}$  at  $30^\circ\text{C}$

# Isotope Effect

Central line of the  $^{19}\text{F}$  NMR spectrum of  $[\text{NMe}_4][\text{TeF}_7]$

# Tellurium Isotopes

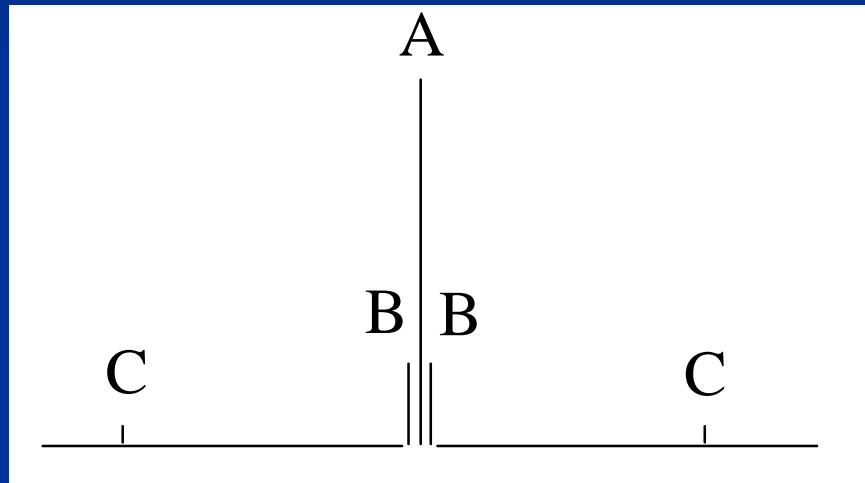

Z		A	NA%	I
52	Te	120	0.09 (1)	
		122	2.55 (12)	
		123	0.89 (3)	$\frac{1}{2}$
		124	4.74 (14)	
		125	7.07 (15)	$\frac{1}{2}$
		126	18.84 (25)	
		128	31.74 (8)	
		130	34.08 (62)	

# Satellite Spectra of Si(CH<sub>3</sub>)<sub>4</sub>

## Isotopomers

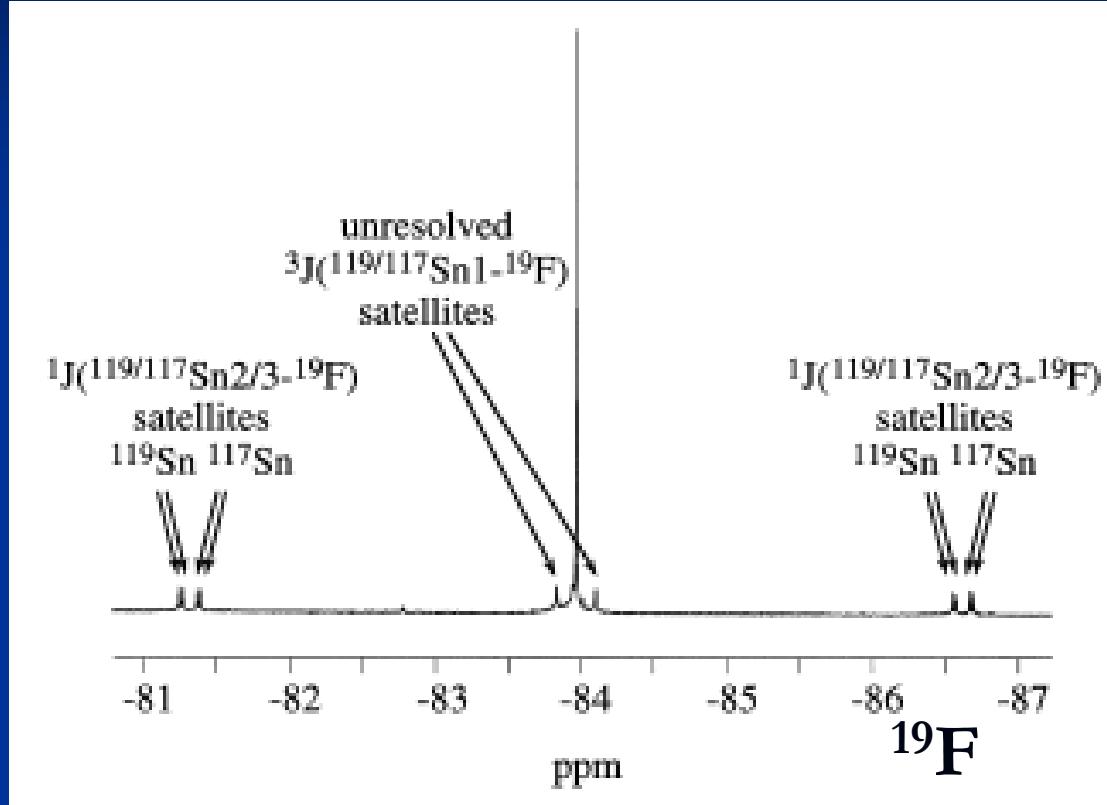

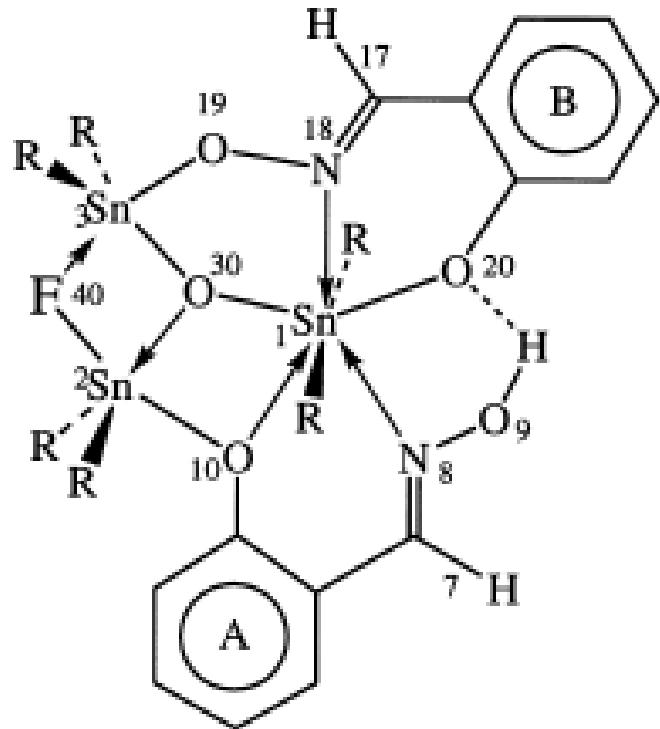

<sup>1</sup>H

Other isotopomers have too low concentration

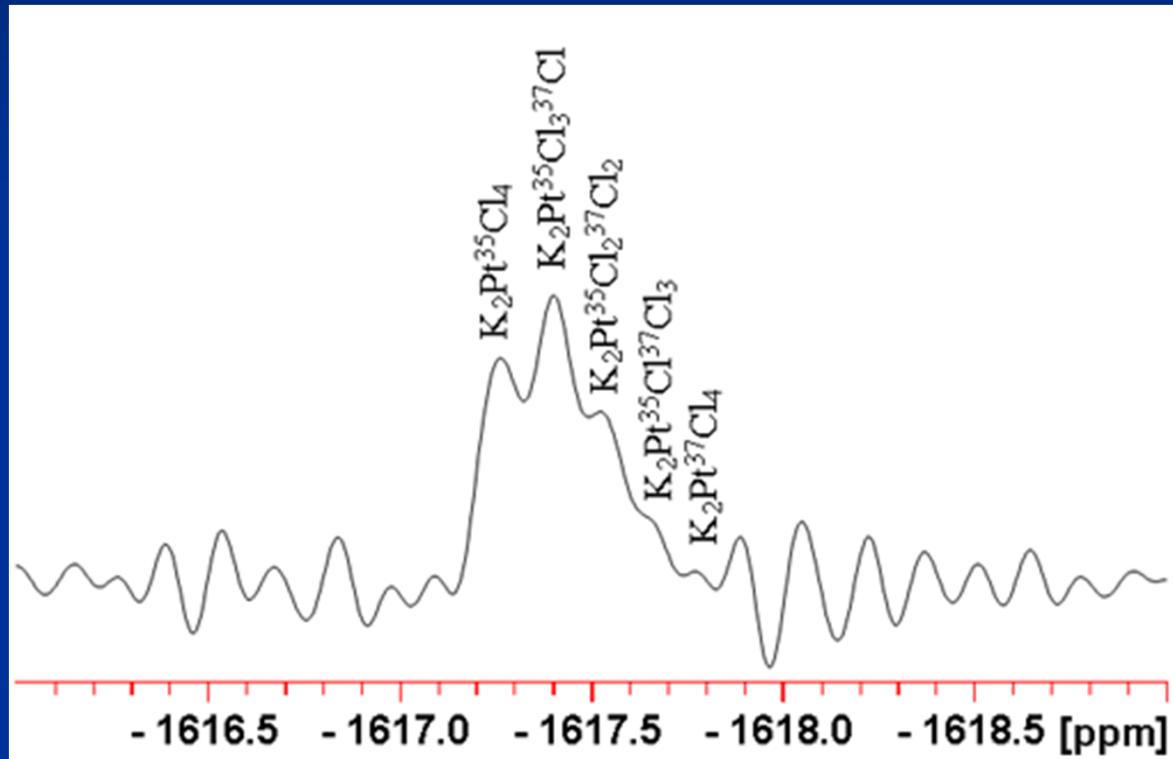

# Satellite Spectra

$[(R_2Sn)_2(R_2SnO)(F)(HONZO)(ONZO)]$ , R = Me  
HONZOH = salicylaldoxime, *ortho*-HO-N=CH-C<sub>6</sub>H<sub>4</sub>OH

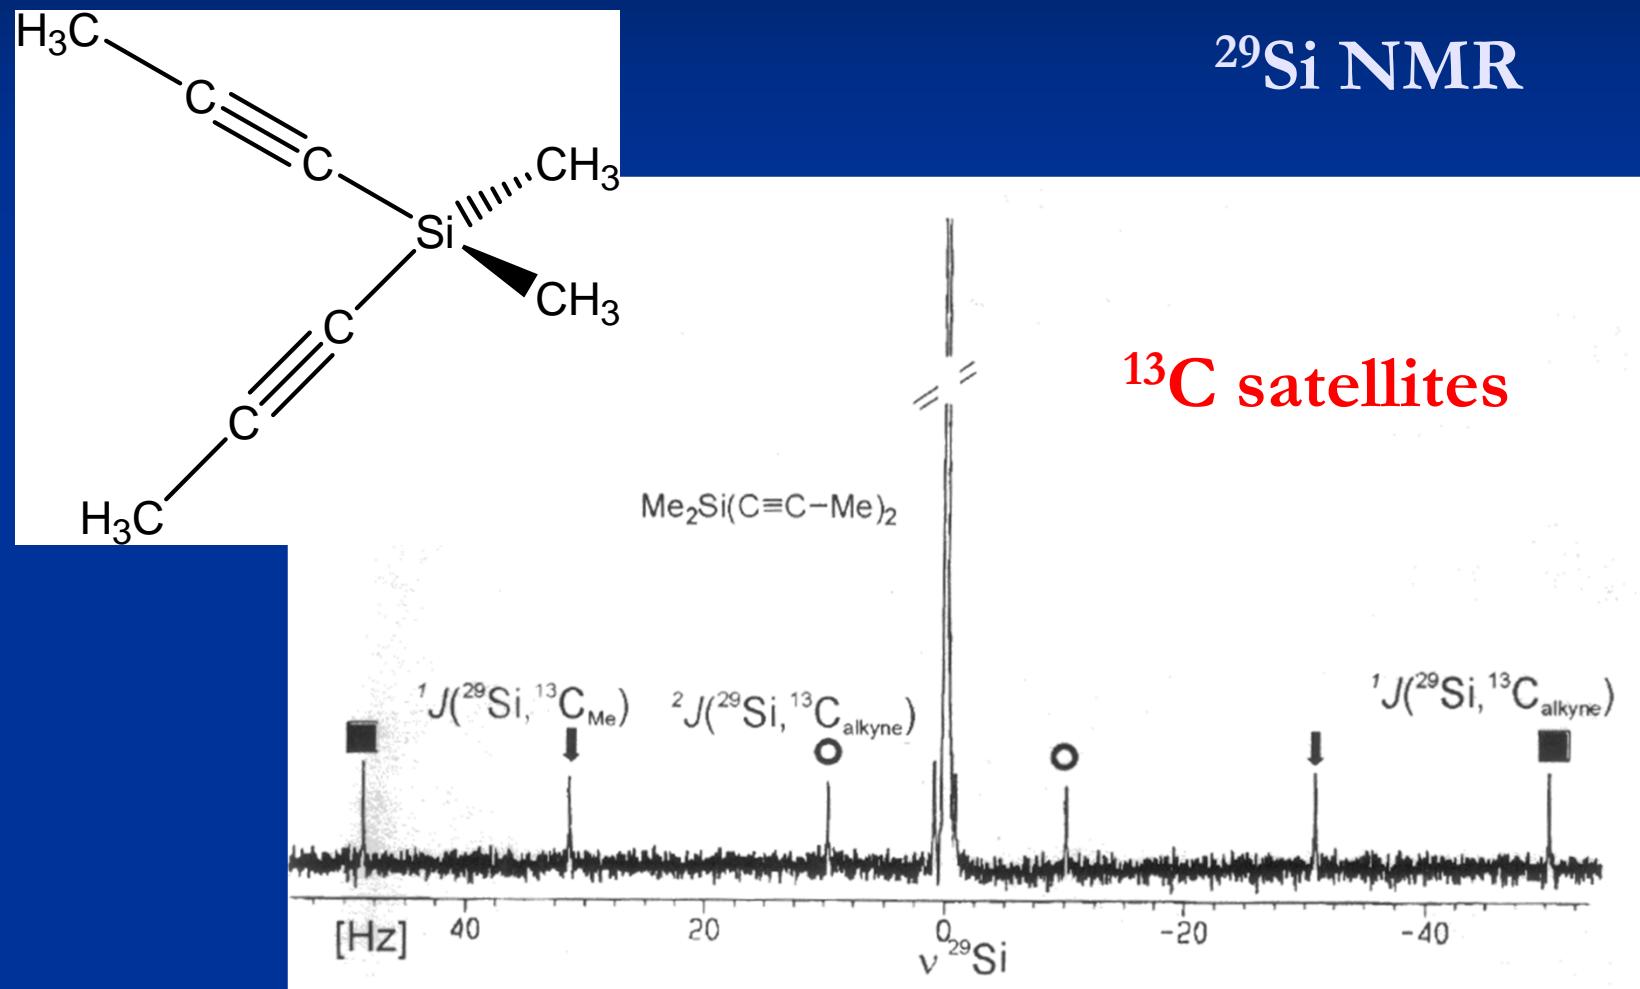

# Satellite Spectra

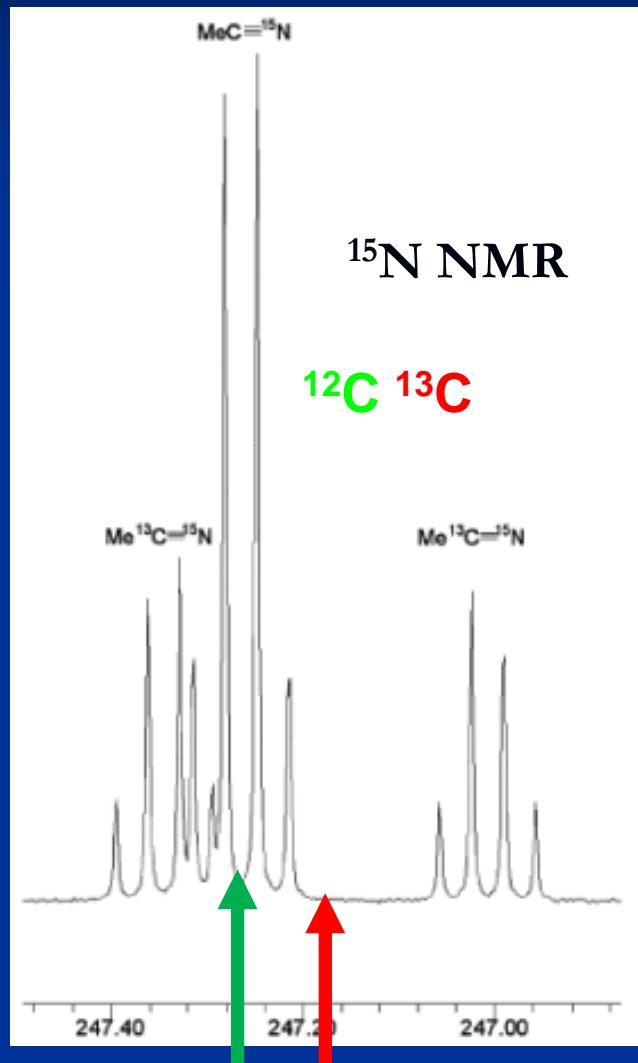

$^{35}\text{Cl}$  75.5 %  
 $^{37}\text{Cl}$  24.5 %

Resolution enhanced  $^{195}\text{Pt}$ -NMR spectrum of  $\text{K}_2\text{PtCl}_4$  in  $\text{D}_2\text{O}$  showing isotopomers

# Satellite Spectra

# Isotope Effect on Satellite Spectra

$^{15}\text{N}$  signal shows coupling to:

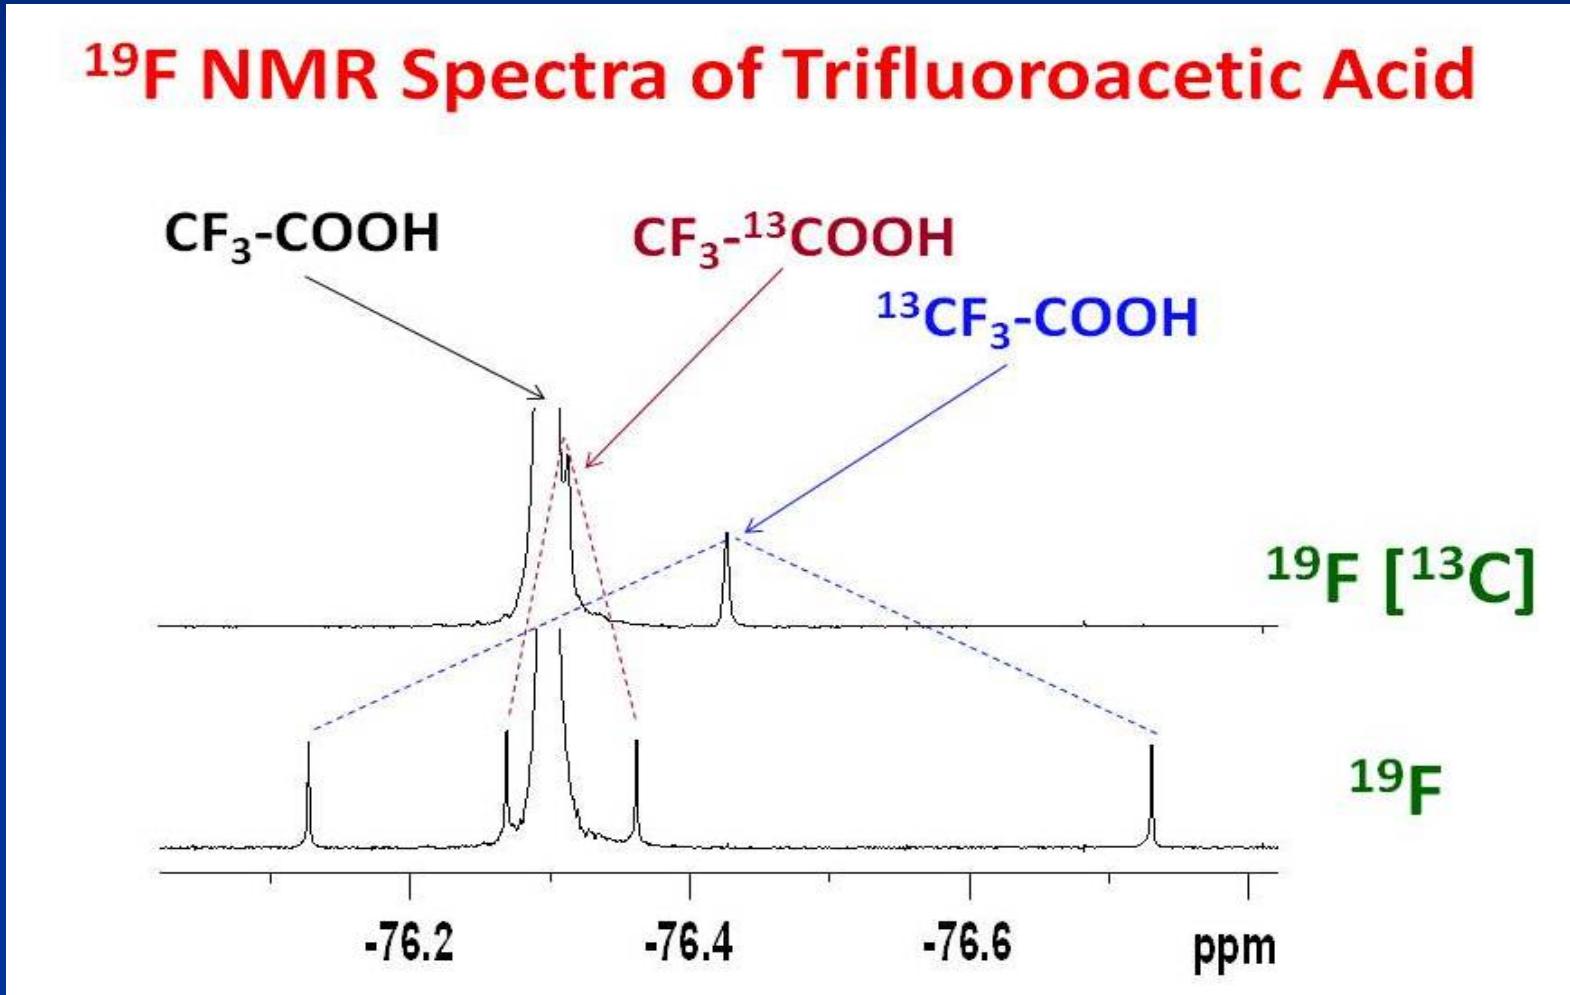

$$^1\text{H} \ ^3\text{J}(\text{H}-^{15}\text{N}) = 1.7 \text{ Hz}$$

$$^{13}\text{C} \ ^1\text{J}(\text{C}-^{15}\text{N}) = 17 \text{ Hz}$$

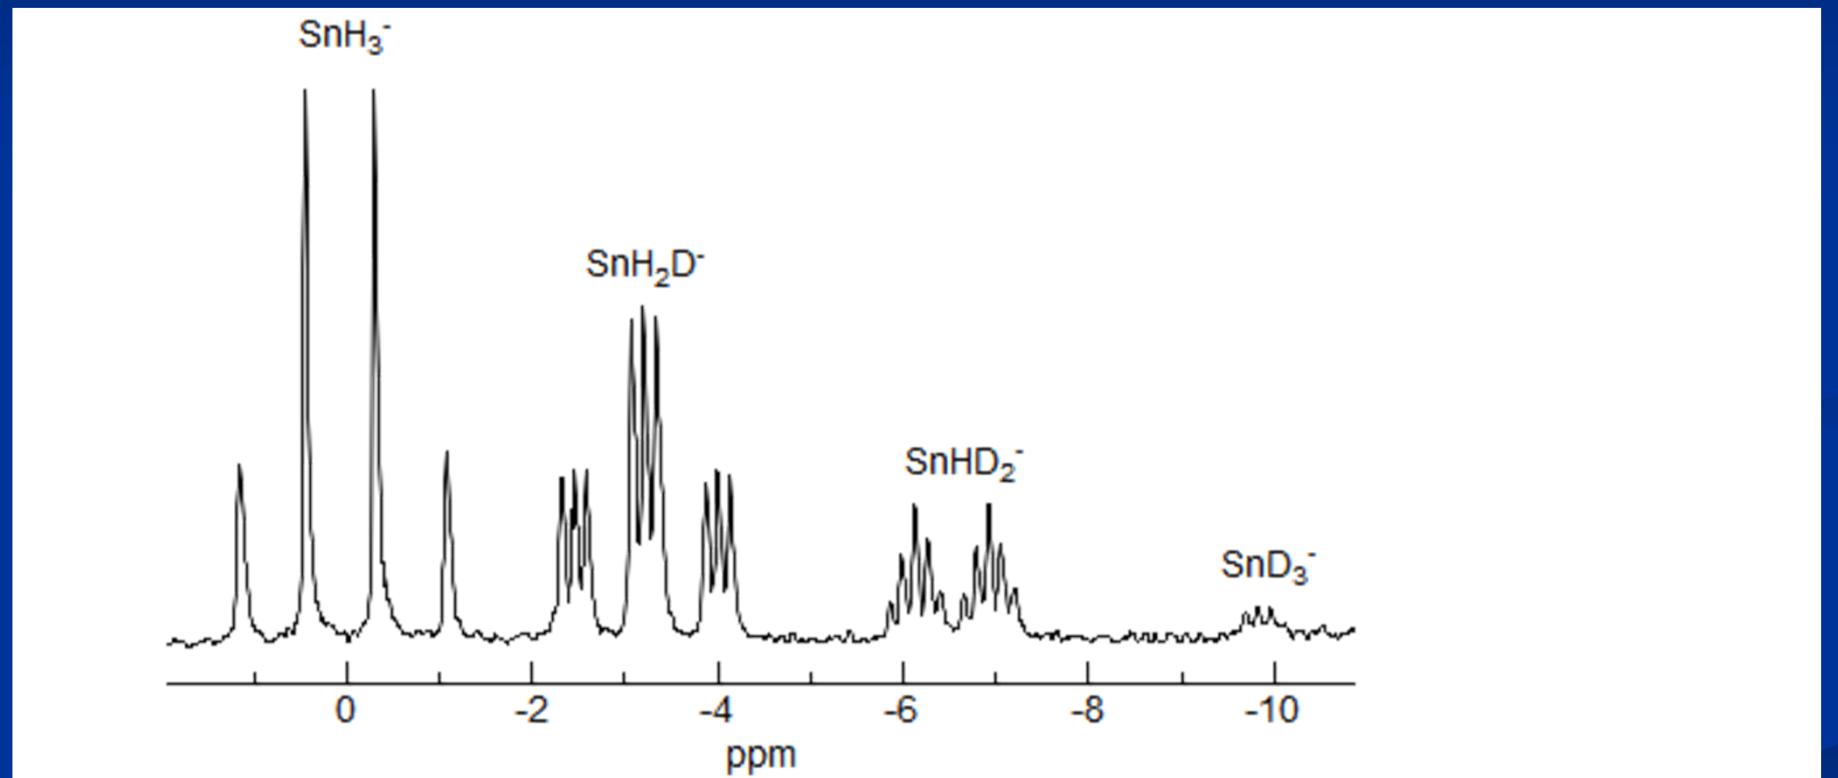

The signal appears as  
a central 1:3:3:1 quartet flanked by  $^{13}\text{C}$   
satellites

The unsymmetrical nature of the  $^{13}\text{C}$   
satellites arises from  $^{12}\text{C}/^{13}\text{C}$  isotopic  
chemical shift perturbation.

$^1\text{H}$  NMR spectrum

$^{195}\text{Pt}$  I =  $1/2$ , NA = 33.8 %

$$f_i = \frac{\sigma}{\sigma_i} a^x b^y c^z \dots$$

# Calculation of Abundance of Isotopologues

Isotopologues and isotopomers

$$f_i = \frac{\sigma}{\sigma_i} a^x b^y c^z \dots$$

$f_i$  = the fractional abundance of isotopomer  $i$

$\sigma$  = the symmetry number of the parent molecule isotopically pure = the order of rotation group  $C_n$

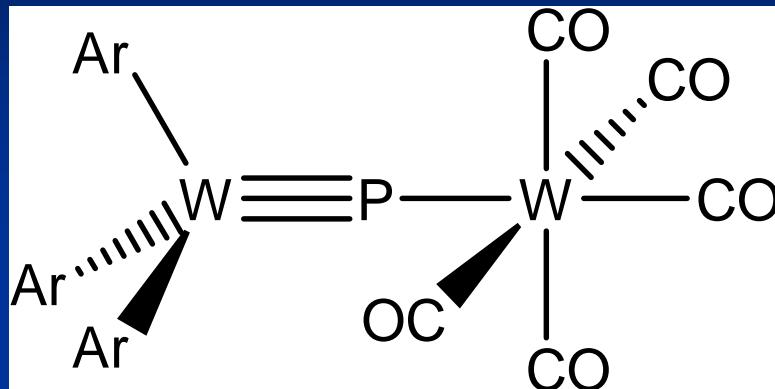

$\sigma_i$  = the symmetry number of the isotopomer

a = abundance of an isotope occurring x-times (in atomic %)

b = abundance of an isotope occurring y-times (in atomic %)

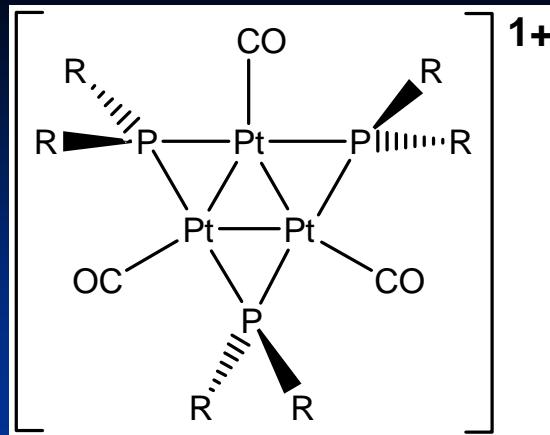

# Abundance of Isotopologues

$$f_i = \frac{\sigma}{\sigma_i} a^x b^y c^z \dots$$

Isotopomer	$\sigma_i$	a (0.144)	b (0.856)	$f_i$
$W \equiv P - W$	1	$a^0$	$b^2$	0.733
$W \equiv P - ^{183}W$	1	$a^1$	$b^1$	0.123
$^{183}W \equiv P - W$	1	$a^1$	$b^1$	0.123
$^{183}W \equiv P - ^{183}W$	1	$a^2$	$b^0$	0.021
