

Kuproxový usmerňovač

Július Vida

F5090 Elektronika (2a)

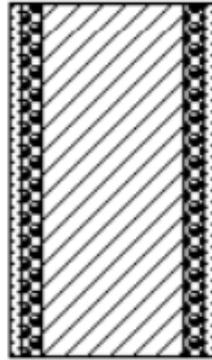

- Cu_2O – polovodič
- Usmerňovacie diódy od roku 1924
- Kremíkové diódy – 1970s
- Polykryštalická štruktúra
- Priepustný smer – z mede do Cu_2O

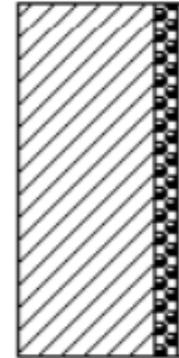

Starting point.

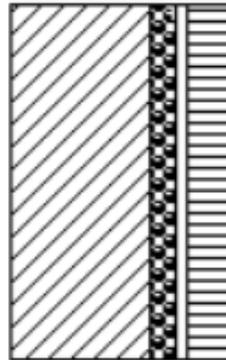

Thermally grown oxides.

Remove oxide layer from one side.

Remove cupric oxide overlayer.

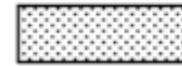

Coat cuprous oxide with Aquadag® and then press on the metal counterelectrode.

Mother Copper

Cuprous Oxide

Cupric Oxide

Aquadag®

Counterelectrode Metal

Elektrické vlastnosti

- Silno závislé na tepelnej úprave Cu_2O
- Pomalé chladenie – vysoké prierazné napätie v závernom smere
- Rapídne chladenie – tolerancia vyšších prúdov
- Striedavé napätie asi 5 V
- Závaž asi $0,05 \text{ A/cm}^2$

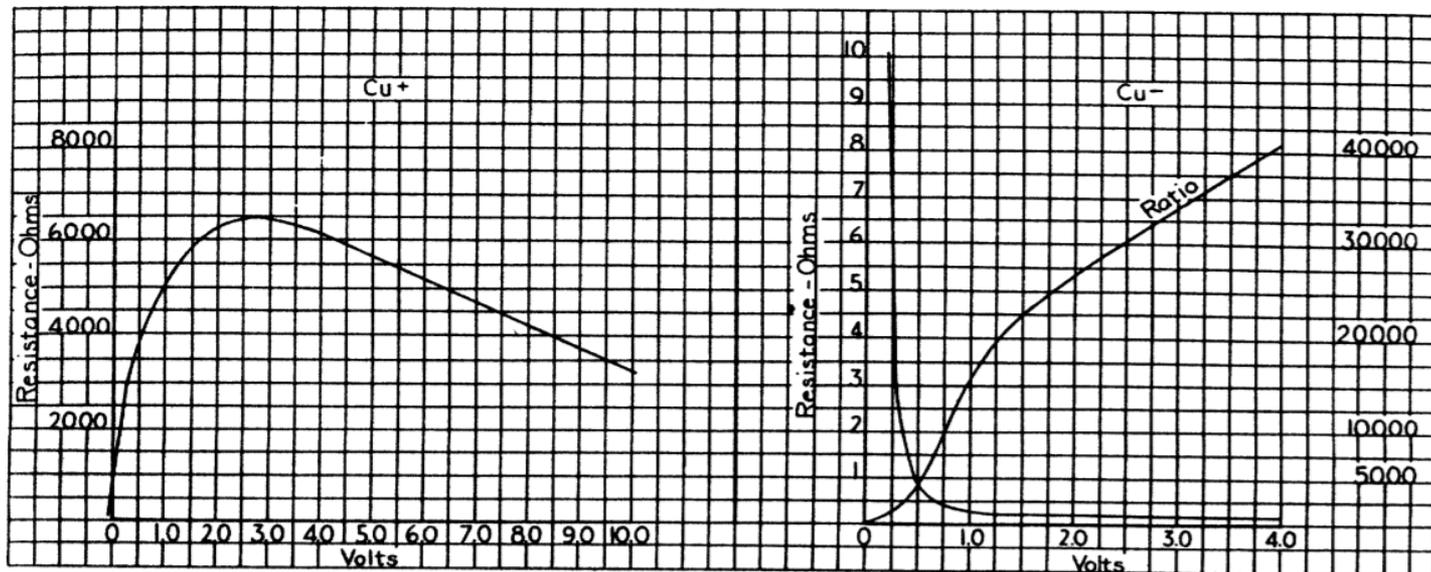

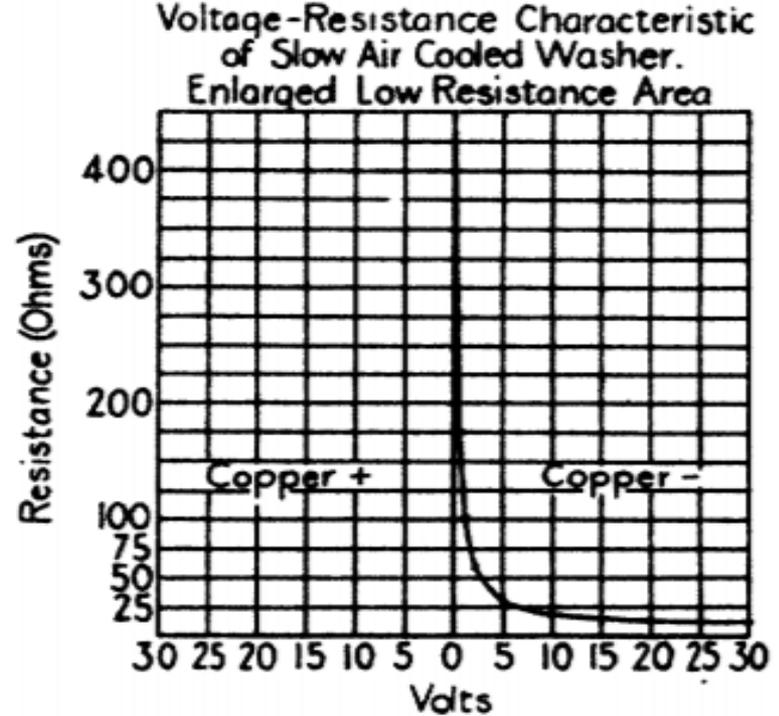

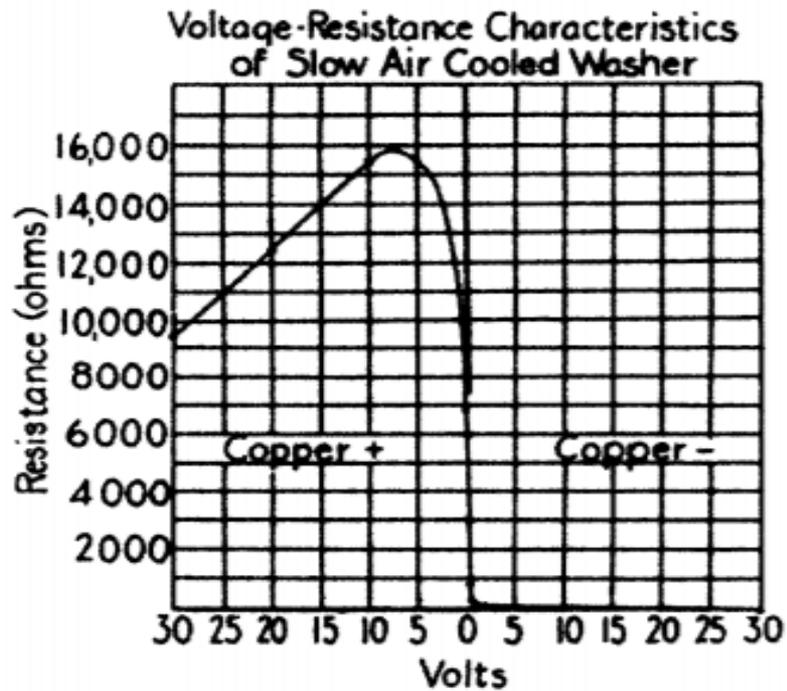

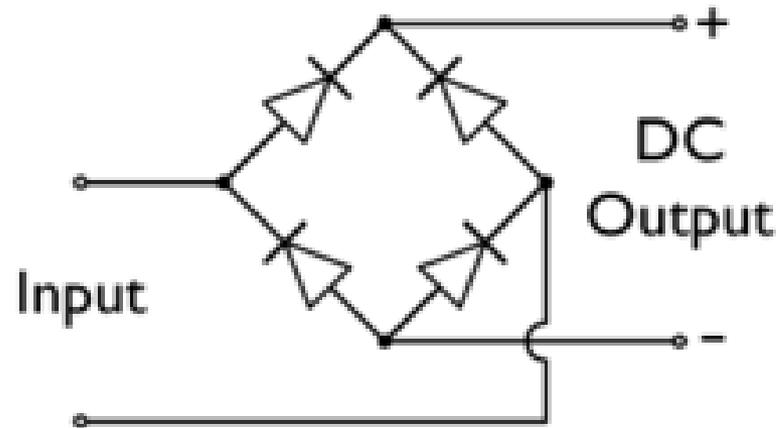

FIG. 12. Resistance voltage characteristics and resistance ratio of water-quenched disk.

Zapojenia

- Disky v sérii – usmerňovanie vyšších napätí
- Disky paralelne – usmerňovanie vyšších prúdov

Aplikácie

- Usmerňovanie
- Demodulátory v rádiových prijímačoch
- Electroplating
- Iné high-current low-voltage aplikácie
