Long-term woodland dynamics in Central Europe: from estimations to a realistic model (2012–2016)

LONGWOOD is a five-year project financed by the European Research Council (ERC –erc.europa.eu) in its Starting Grant scheme. The mission of ERC is to encourage the highest quality research in Europe through competitive funding and to support investigator-initiated frontier research. The principal investigator of the LONGWOOD project is Péter Szabó.

The interdisciplinary LONGWOOD project connects several disciplines that deal with past environments. Its starting point is the assumption that the vegetation of Central Europe has been directly influenced by humans for at least eight millennia; the original forests have been gradually transformed into today's agricultural landscape. However, there is more to this landscape change than the simple disappearance of woodland. Forests have been brought under various management regimes, which profoundly altered their structure and species composition. The details of this process are little known for two main reasons. The greatest obstacle is the lack of cooperation among the disciplines dealing with the subject. The second major problem is the differences in spatio-temporal scaling and resolution used by the individual disciplines. Existing studies either concern smaller territories, or cover large areas (continental to global) with the help of modelling-based generalizations rather than primary data from the past. Using an extensive range of primary sources from history, historical geography, palaeoecology, archaeology and ecology, this interdisciplinary project aims to reconstruct the long-term (Neolithic to present) patterns of woodland cover, structure, composition and management in a larger study region (Moravia, the Czech Republic, ca. 27,000 km²) with the highest spatio-temporal resolution possible. Causes for the patterns observed will be analyzed in terms of qualitative and quantitative factors, both natural and human-driven, and the patterns in the tree layer will be related to those in the herb layer, which constitutes the most important part of plant biodiversity in Europe. This project will introduce woodland management as an equal driving force into long-term woodland dynamics, thus fostering a paradigm shift in ecology towards construing humans as an internal, constitutive element of ecosystems. By integrating sources and methods from the natural sciences and the humanities, the project will contribute to a more reliable methodology for woodland management and conservation in Central Europe.

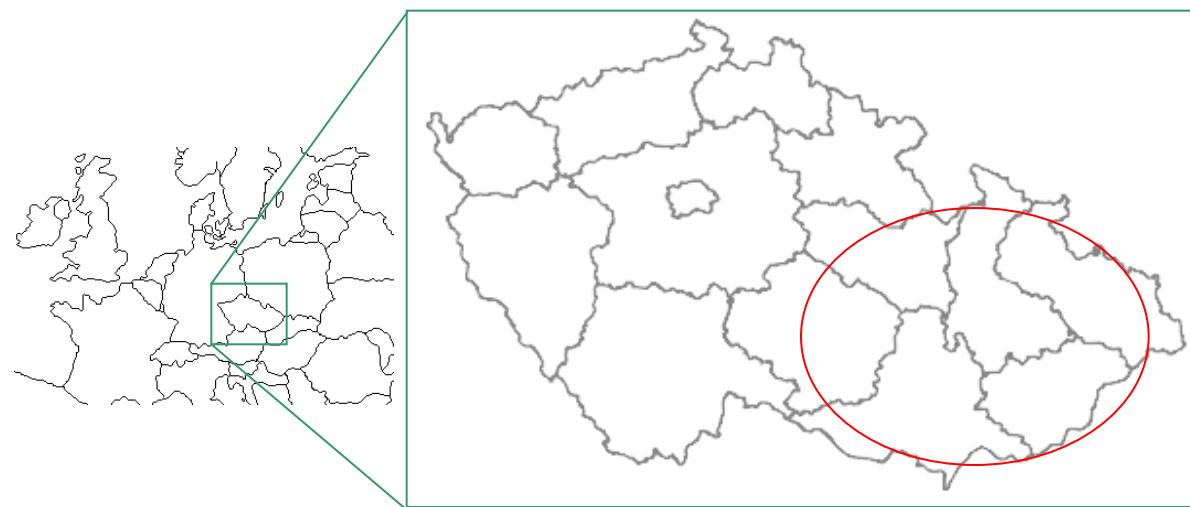

VEGETAČNÍ
EKOLOGIE

www.longwood.
cz

Aims

- to combine historical, palaeoecological, vegetation ecological and archaeological data in GIS
- to study woodland dynamics for the past 8000 years in a well-defined, larger study region (Moravia) with the highest resolution possible
- to relate past patterns in the tree layer to patterns in the herb layer
- to analyze the role of humans in woodland dynamics
- to contribute to forest management and nature conservation policies

Palaeoecology working group

- long-term vegetation dynamics: past 11,000 years
- focus on changes in woodland cover, composition and structure

Data sources

- sedimentary pollen data
(lakes and forest hollows)
- ^{14}C or ^{210}Pb dating
- pollen productivities,
quantitative vegetation
reconstruction

24 new or newly dates sites, 106 new ^{14}C dates

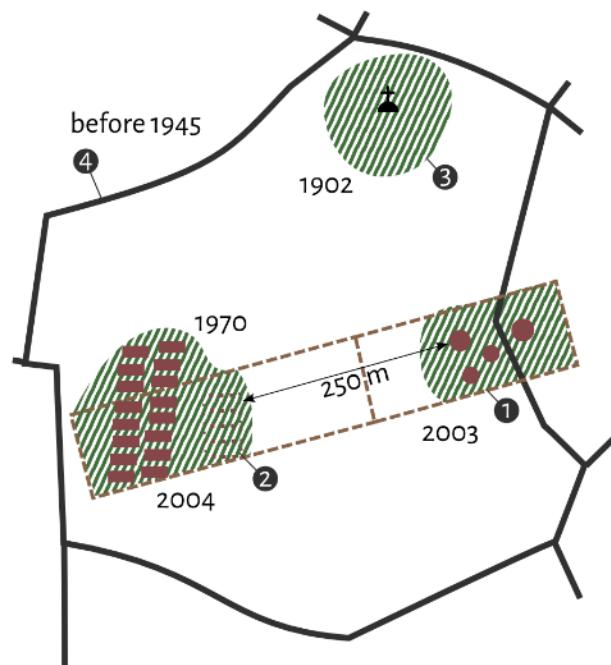

Archaeology working group

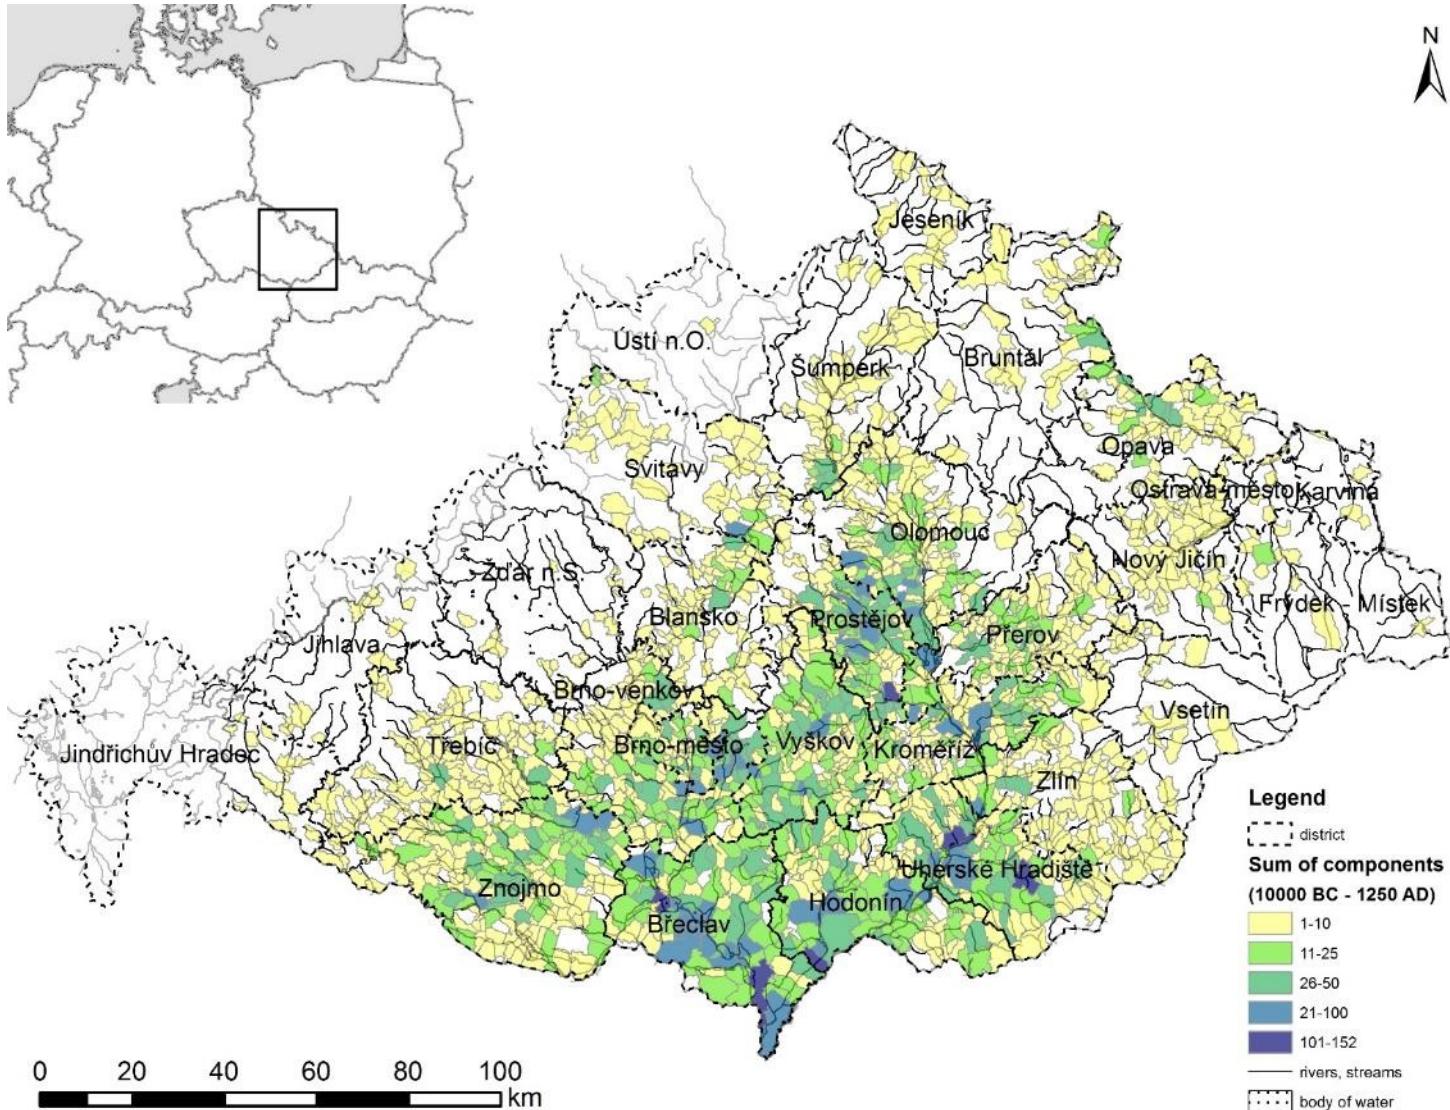

- past 8,000 years
- focus on human activities
- from coarse to precise resolution

Data sources

- unpublished
and published
research reports

Parish - Locality - Components

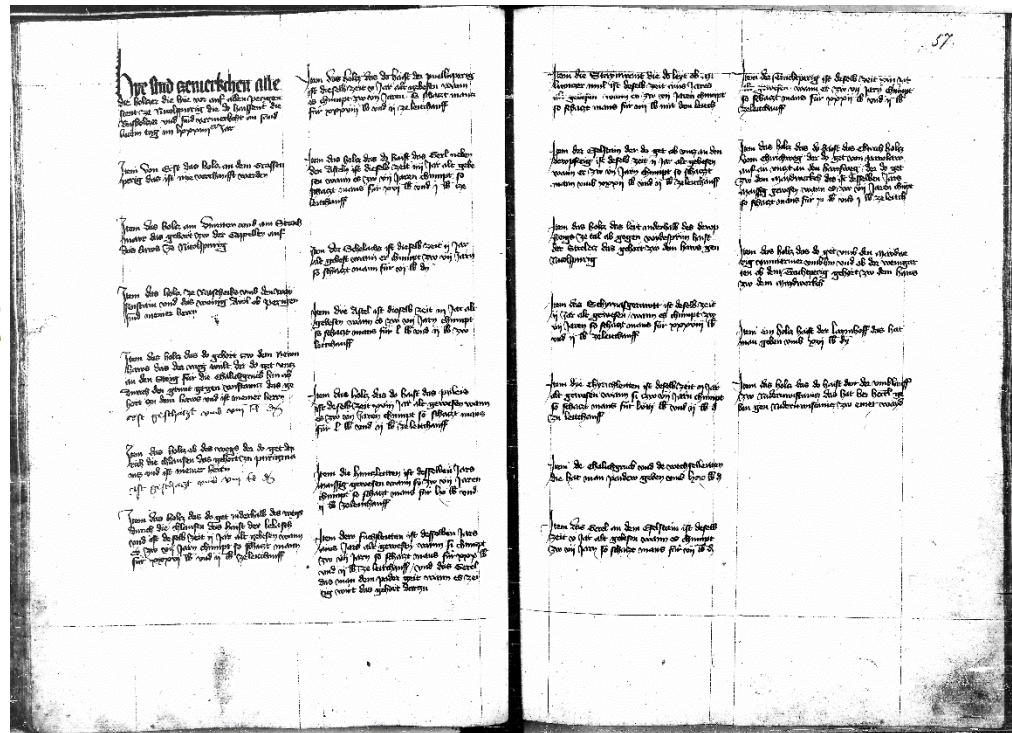

19,021 archaeological components coming from
7861 archaeological sites in 1685 civil parishes

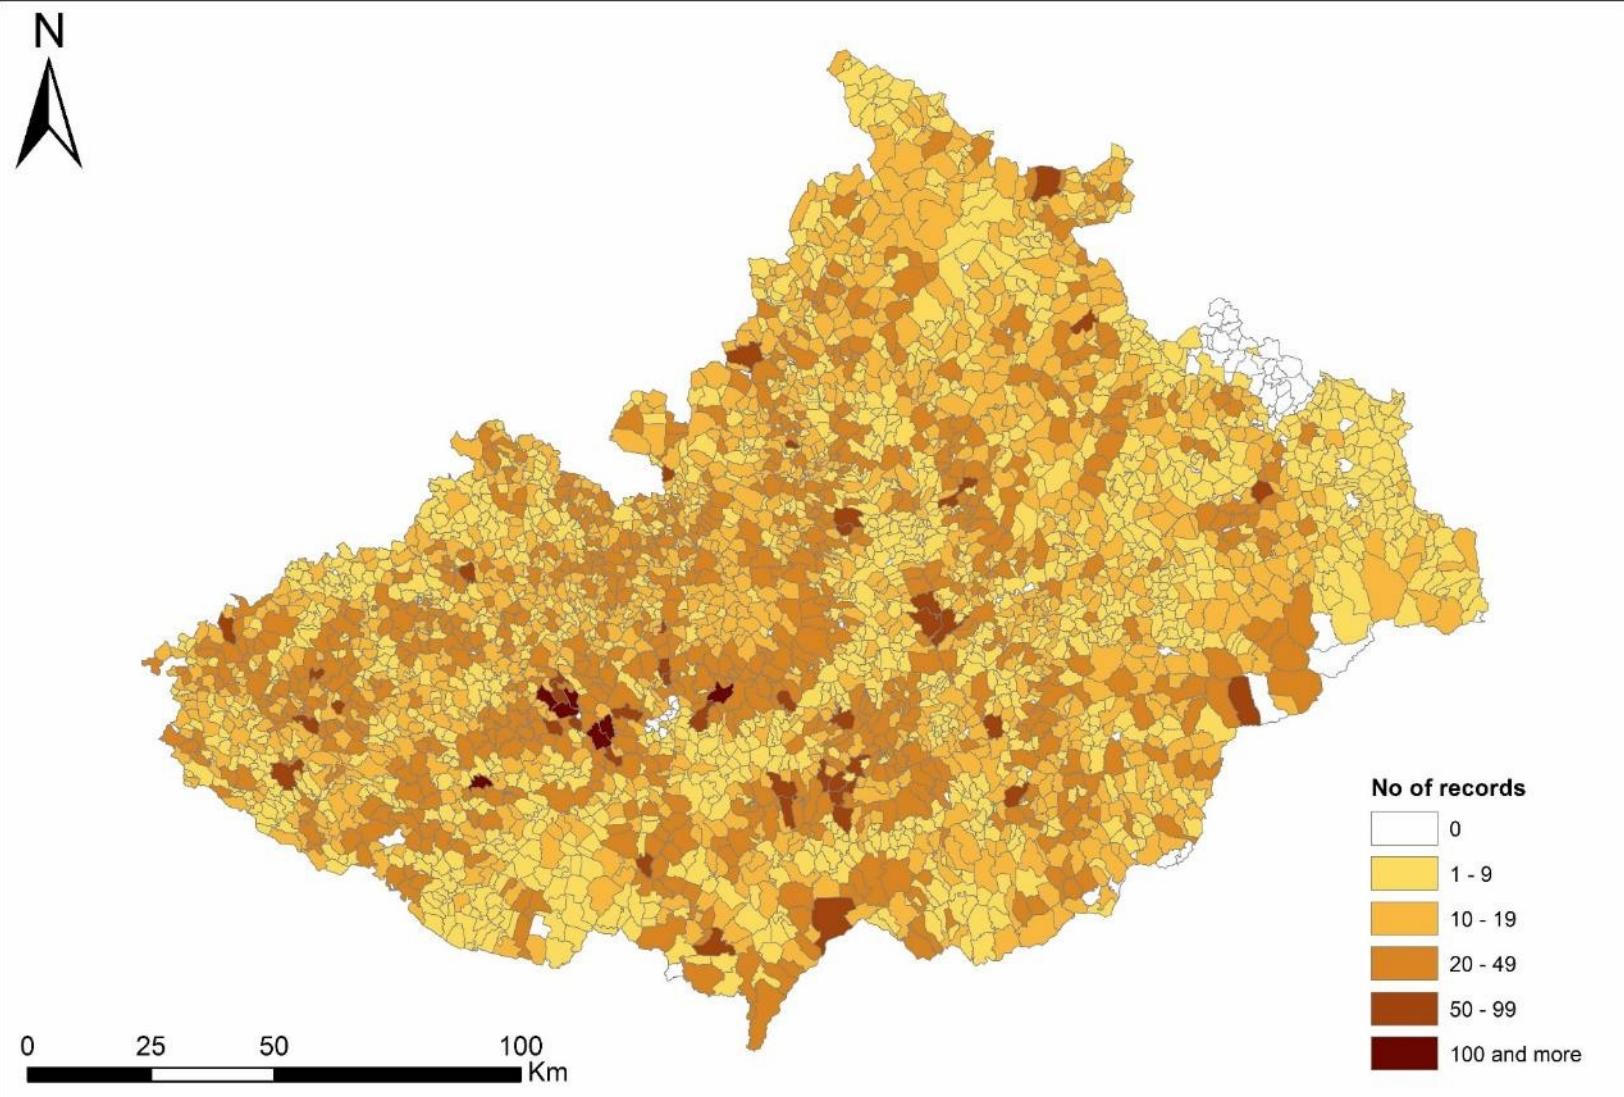

History working group

- forest extent, management and species composition since the Middle Ages
- resolution: township (katastrální území)

Data sources

- charters
- account books
- urbaria
- cadastres
- forest management plans

50,000 pieces of information on individual forests
from 465 different archival sources ranging from
the 11th to the 20th centuries

Vegetation ecology working group

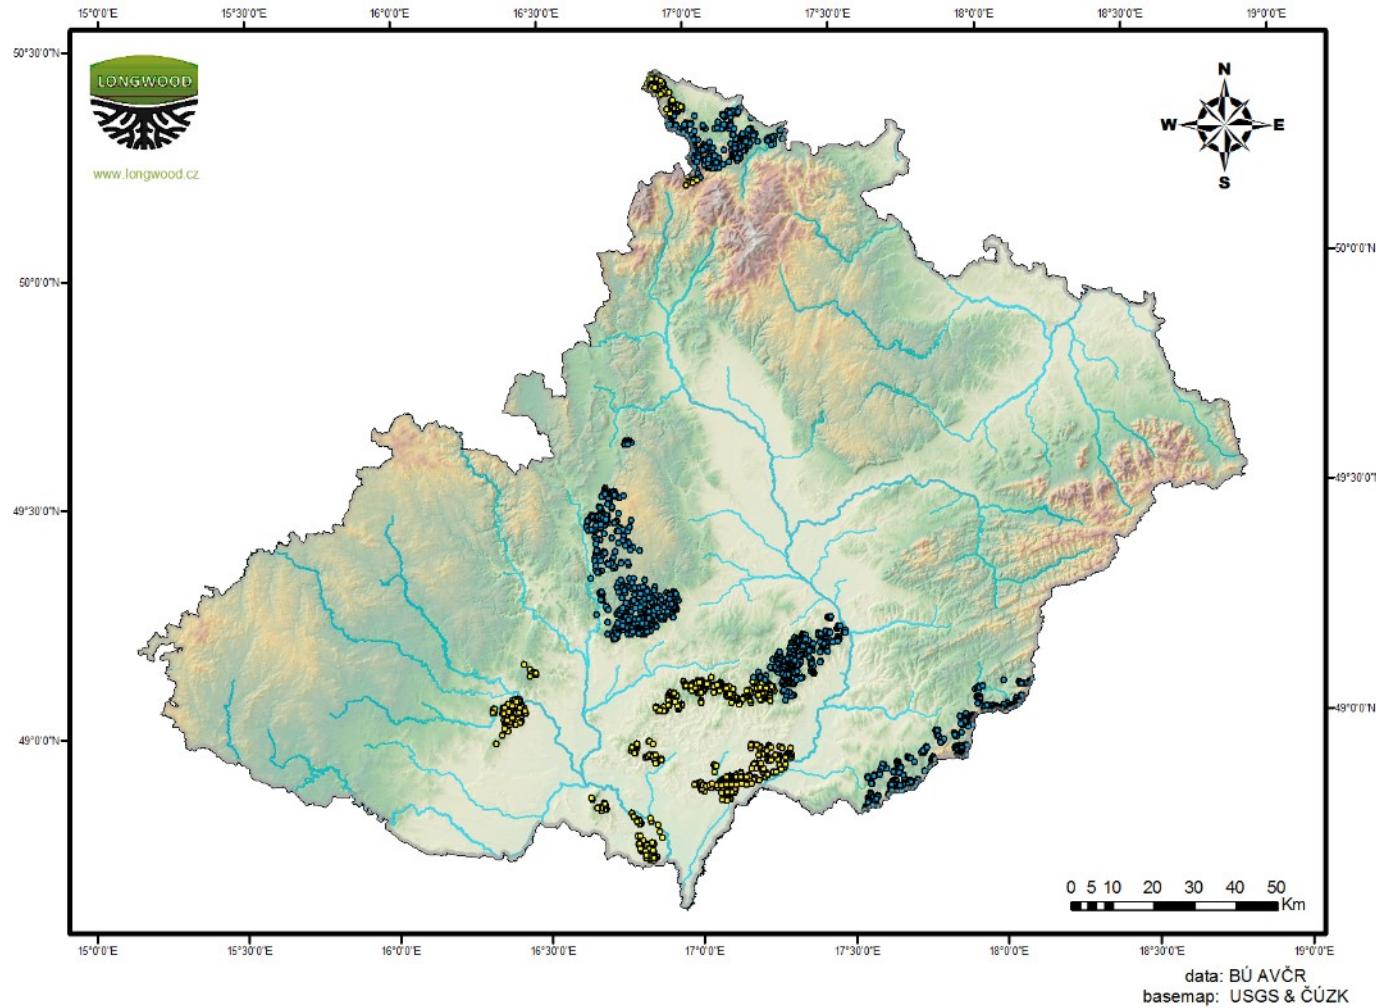

- most recent history of forests in Moravia: the past century
- focus on biodiversity, composition and individual species
- fine resolution

Data sources

- field survey
- vegetation plot databases
- lab measurements
- GIS resources

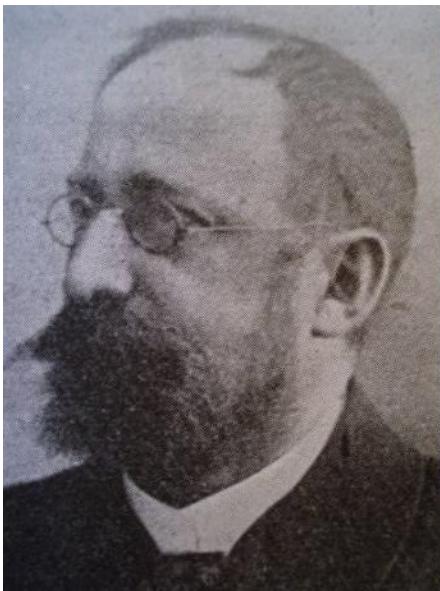

Forest Resurvey Plots

2166 semi-permanent resurveyed plots, 600 permanent plots, 168 experimental plots

Why does woodland history matter for today's forests?

1. It helps us understand current patterns and processes
2. It fosters better informed management and policy decisions
3. It places ecology, conservation and restoration in a wider (conservation and other) context

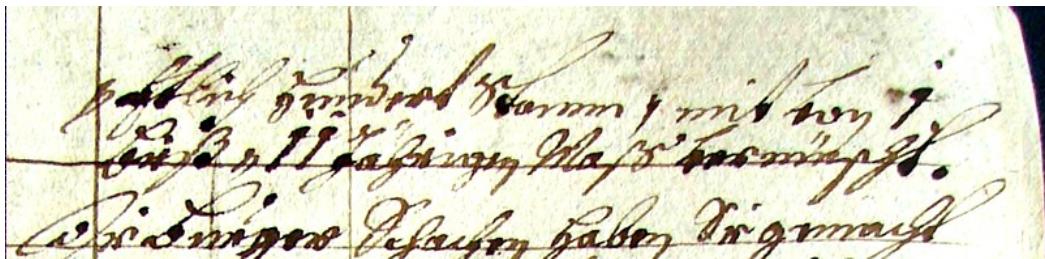

Děvín

1. It helps us understand current patterns and processes in nature

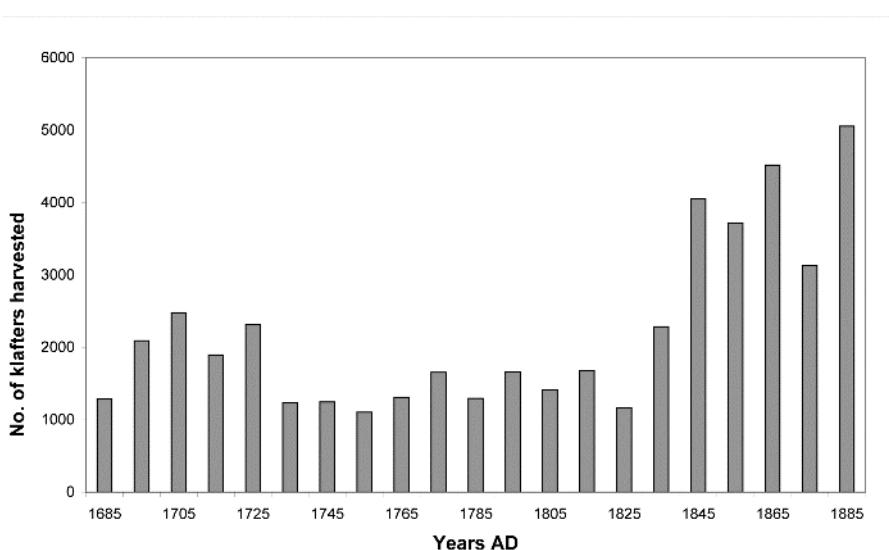

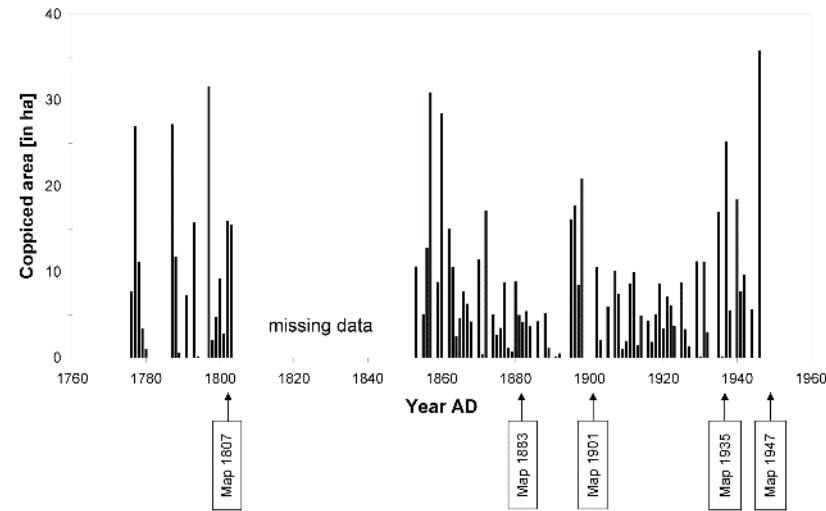

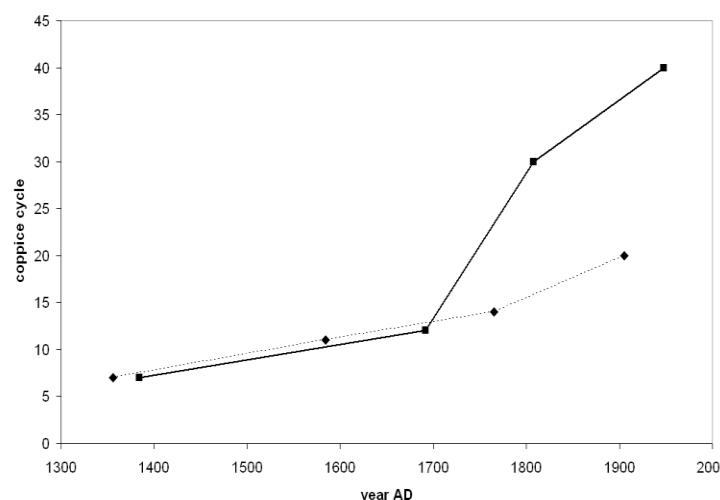

1384 urbarium:

“Das holcz, das do get niderhalb des wegs durich die Chlausen, das haist der Lelasch, und ist deselb zeit 2 jar alt gevesen; wann er zw 7 jarn chumpt, so schaczt mann für 36 lb. und 2 lb. ze leitchauff.”

The Estonian environmental history scene: Publications, exhibitions, outreach

The Estonian Centre for Environmental History (KAJAK) was established in 2011. Slowly but steadily, the habit of incorporating environmental perspectives into ‘classical’ historical research has gained a footing in Estonia. Ecocriticism and ecosemiotics already existed; the cooperation between the scholars from these fields with environmental historians has been lively and rewarding. This cooperation has borne fruit in a number of jointly organised conferences and other academic events (e.g., the EASLCE biennial conference ‘Framing Nature’ in 2014 and an international doctoral school ‘Animals in Transdisciplinary Environmental History’ in 2015, to name but a couple), plus several joint efforts resulting in publications in Estonian and in other languages, such as English, German and Russian.
