

Chromozomy – jak zjistit kolik má daný druh chromozomů?

<http://ccdb.tau.ac.il/home/>

The screenshot shows the homepage of the Chromosome Counts Database (CCDB). The website features a green header with the CCDB logo and a search bar. Below the header, there is a navigation menu with links for Home, About, Browse, Services, Add new counts, and Contact. The main content area includes a description of the database, a news section, and a browse section with images of various plant groups.

The **Chromosome Counts Database (CCDB, version 1.58)** is a comprehensive community resource for plant chromosome numbers. CCDB aims to combine existing data resources into an extensive central database that will be updated regularly by the community.

Users and researchers are encouraged to contribute to the accuracy and completeness of the data in CCDB by **submitting new counts**, or **reporting erroneous counts**.

To start browsing for chromosome numbers, use the **Browse** page, or the search box above.

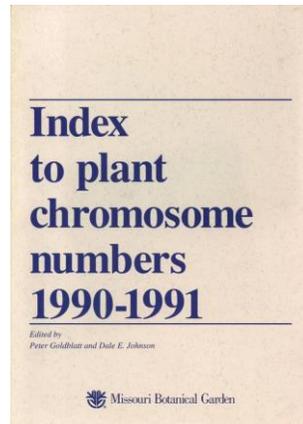

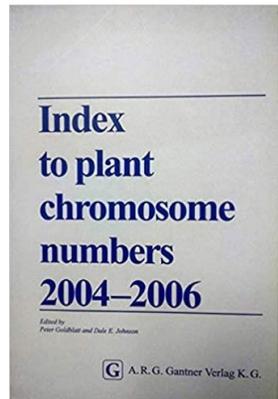

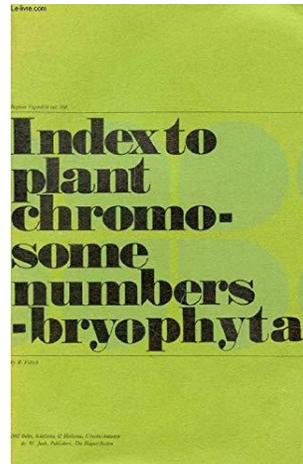

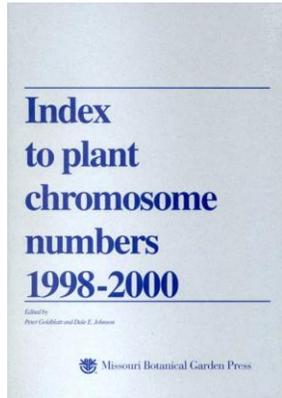

Recommended citation:
CCDB is built upon many individual data collection efforts. In addition to the main citation detailed below we recommend citing the major resources where the downloaded data were first assembled.

Chromozomy – jak zjistit kolik má daný druh chromozomů?

<http://legacy.tropicos.org/Project/IPCN>

The screenshot shows a web browser window with the URL <http://legacy.tropicos.org/Project/IPCN>. The page title is "IPCN Chromosome Reports". The main heading is "Index to Plant Chromosome Numbers (IPCN)". The text describes the project as an NSF funded project that aims to extract and index original plant chromosome numbers. It provides information on how to use the database and where to find the data. A large green arrow points from the book covers on the left towards this website screenshot.

Index to Plant Chromosome Numbers (IPCN)

The *Index to Plant Chromosome Numbers* was an NSF funded project that aims to extract and index original plant chromosome numbers of naturally occurring and cultivated plants published throughout the world. A committee of voluntary contributing editors, located in various parts of the world, reviews sets of serial titles assigned to them and returns the information to the editors for collation in the *Index* and database. Chromosome indexes were published at two or three year intervals. The *Index to Plant Chromosome Numbers* project was based at the Missouri Botanical Garden since 1978. Data from published indexes from 1979 onward are available for consultation through this facility.

For additional information, see the last supplement by Goldblatt & Johnson 2006. *Index to Plant Chromosome Numbers 2001-2003. Monographs in Systematic Botany from the Missouri Botanical Garden* 106.

An Index covering the years 2004-2006 was published in 2010 as: Goldblatt & Johnson (eds) 2010. *Index to Plant Chromosome Numbers 2004-2006. Regnum Vegetabile*. Vol. 152.

Many but not all data in the printed version of the *Index to Plant Chromosome Numbers* (1979--) are available on the Web in the IPCN database. The printed indexes and the database provide references to chromosome counts reported in the original literature. We therefore request that the IPCN database itself not be cited as the source for chromosome counts. If there is a need to cite the IPCN database, we recommend the following:

Index to plant chromosome numbers. 1979-- . P. Goldblatt & D. E. Johnson, eds. Missouri Botanical Garden, St. Louis.

How to use the Chromosome Index.

The chromosome data is available in several different ways. First information is available on the Name screens as a tab for any taxon with counts – click on the 'chromosome counts' tab and see the reported counts with reference.

Second, under the System **project** tab (top yellow banner) there is a link to "IPCN Chromosome Reports" that provides a name search for direct display of counts for each taxon and Browse links for families, genera.

The Family and genera browse options provide links to included taxa on the page under 'lower taxa' (genera for families and species for genera) with counts. Click on the taxon link and see all of the species with counts – click on the taxon to see all of the counts for that taxon. The species browse screen provides an alphabetical list of species in the project and the link to displays the counts and references.

Last, next to each family/genus on the browse list or at the bottom of the lower taxa lists under families/genera is an (**export**) link. This will download a complete list of all the included taxa with counts and references, to the user pc. This '.dat' file is a tab delimited ascii file that can be saved and/or opened with Excel (or other similar programs) that can be used for searches or sorting on the users pc. Note that this may be a very large file if for example one exports all of the counts for Asteraceae rather than only the genera or species that are needed.

The DNA amount in the unreplicated gametic nucleus of an organism is referred to as its C-value, irrespective of the ploidy level of the taxon. The Plant DNA C-values Database currently contains C-value data for 12,273 species comprising 10,770 angiosperms, 421 gymnosperms, 303 pteridophytes (246 ferns and fern allies and 57 lycophytes), 334 bryophytes, and 445 algae.

GSAD
Genome size in Asteraceae database
release 3.0, July 2018

Search...

Author Infrasp. author Chrom. number n/2n Life cycle Ploidy level Standard **Advanced**
Optional identification of the user: youremail@email.com

Welcome to the GSAD: Genome Size in Asteraceae Database (Release 3.0) NEW

The GSAD is an exhaustive catalogue of genome size data for the family Asteraceae. Genome sizes are now available for 1,555 species based on 4,350 records from 198 publications released until July 2018. The current update represents around 40% increase of data entries with respect to release 2. There are 337 species (21.67%) and 46 genera (19.83%) recorded for the first time.

The main goal of the database is to serve as a tool aiming to make Asteraceae genome size information accessible to scientists interested in genome characterisation and evolution with basic (e.g. plant molecular systematics, NGS programs, evo-devo research) or applied (e.g. barcoding, breeding, races or raw material identification) focuses.

The database holds data from papers already published or in press up to July 2018. Regular updates are planned.

Velikost genomu – jak velký genom má daný druh?

<http://www.genomesize.com/>

The screenshot shows the homepage of the Animal Genome Size Database. At the top, the browser address bar displays www.genomesize.com. The main header reads "ANIMAL GENOME SIZE DATABASE" in large blue letters, with a "HOME" link on the right and a "Contact" link in the top right corner. On the left side, there is a vertical navigation menu with the following items: Home, Search Data, Statistics, FAQ, References, Submit Data, and Links. Below the menu, there are logos for Gregory Lab Genomic Diversity, University of Guelph, and the Biodiversity Institute of Ontario. A book cover titled "THE EVOLUTION OF THE GENOME" edited by T. Ryan Gregory is also visible. The main content area features a quote in French: "Il est hors de doute que l'étude systématique, de la teneur absolue du noyau en acide desoxyribonucleique, a travers de nombreuses especes animales, puisse fournir des suggestions interessantes en ce qui concerne le probleme de l'evolution." attributed to Vendrely and Vendrely, 1950. A "Translate" link is provided below the quote. At the bottom, a welcome message states: "Welcome to the *Animal Genome Size Database*, Release 2.0, a comprehensive catalogue of animal genome size data. Haploid DNA contents (C-values, in picograms) are currently available for 6222 species (3793 vertebrates and 2429 non-vertebrates) based on 8004 records from 786 published sources. You can navigate the database using the menu on the left. New features in Release 2.0 include enhanced [browsing and search](#) functions, data export capabilities, and up to the minute [summaries](#) of available data."
