

1. Na listech CLM a Histogramy otestujte platnost centrální limitní věty podle zadání.
2. Na listu Velikost vzorku otestujte konvergenci průměru.
3. Pokud vám to nestačí, zkopírujte součty ze sloupce R na listu CLM do Statistiky, vykreslete

• histogram o 10 sloupcích a testujte Shapiro-Wilkovým testem normalitu.

- Použijte funkce NÁHČÍSLO() a ZAOKR.DOLŮ() k vygenerování náhodných čísel odpovídajících 200 hodů
- Opakujte tentýž postup pro oblasti ve sloupcích F, H, J, L , N a P.
- Pomocí funkce COUNTIF() spočtěte četnosti jednotlivých čísel na kostkách ve sloupcích D, F, H, J, L, N a P.
- Na list Histogramy vložte sloupcový graf (histogram) se šesti sloupcí, jejichž výška odpovídá četnosti hod.
- Použijte funkci SUMA() a do oblasti R12:R211 vložte řádkové součty předchozích osmi sloupců (tj. celá řada).
- Na list Histogramy vložte sloupcový graf (histogram) se 12 sloupcí, jejichž výška odpovídá četnosti hod.
- Okomentujte, proč se tvary obou histogramů liší a co z nich lze vyčíst.

### Četnost čísel na jedné kostce

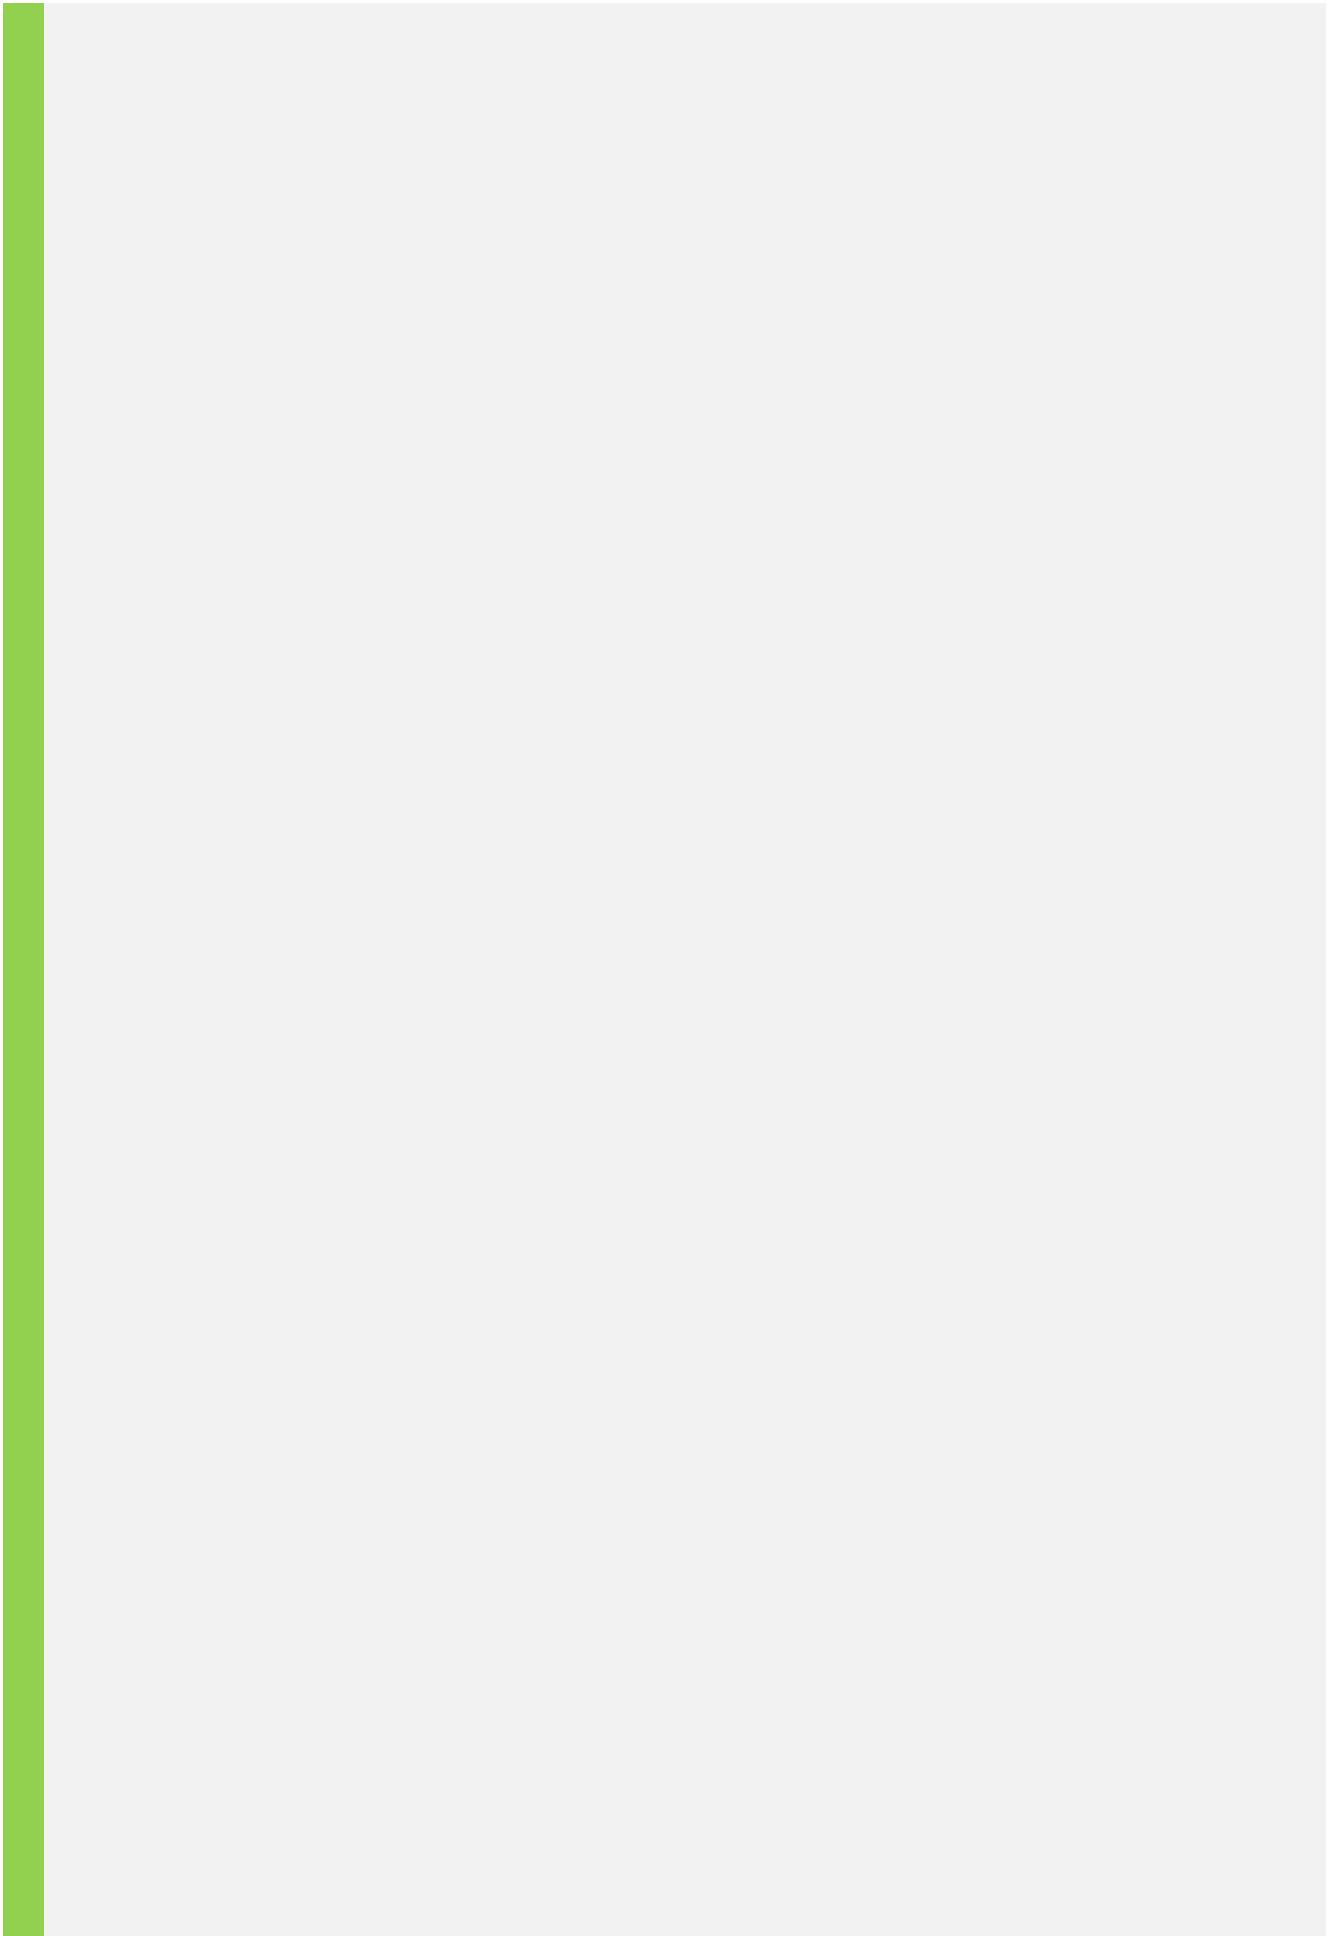

## Četnost součtu čísel na sedmi kostkách

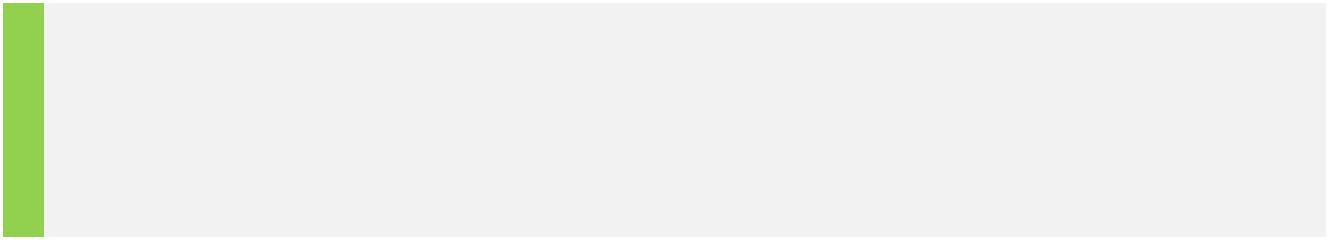

1. Nyní budeme házet dvanáctistěnnou kostkou a pokusíme se na základě našeho vzorku (daného počtem hod) vygenerovat 100 nových hod.
2. Vygenerujte do oblasti U6:U105 celkem 100 reprezentací hodu dvanáctistěnnou kostkou (1-12).
3. Využijte kombinaci relativního a absolutního odkazu pro výpočet postupných průměrů všech dosavadních hod.
4. Jaký je předpokládaný průměr náhodné veličiny hod kostkou, pokud předpokládáme, že je dodekaedr?
5. Vytvořte graf s lomenou čárou ukazující, jak konverguje průměrná hodnota se zvyšujícím se počtem hod.

Graf:

n hodů) odhadnout střední hodnotu (průměr) náhodné veličiny - hodu kostkou.

ních hodů ve sloupci V.  
dokonale pravidelný?  
odů kostkou.
