Next-generation sequencing (NGS)

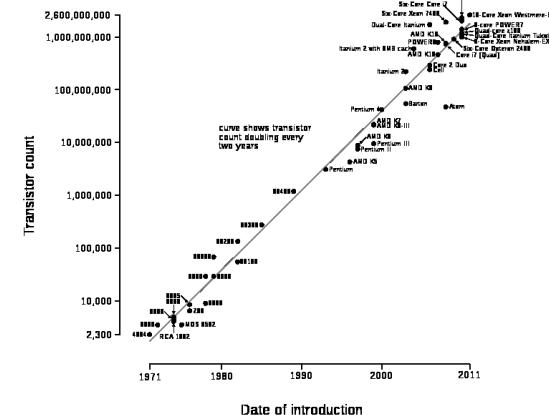

FIGURE 1: Evolution of DNA revolution.

Cost per Human Genome

Microprocessor Transistor Counts 1971-2011 & Moore's Law

Illumina HiSeqX10

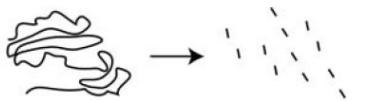

\$1M per machine

1.8 Tbase per machine per 3 days

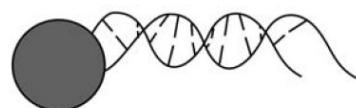

1800 human genomes per machine per year

Historie „Next generation sequencing“

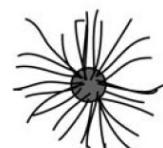

1) Randomly fragment many molecules of target DNA

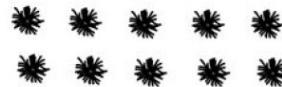

2) Immobilize individual DNA molecules on solid support

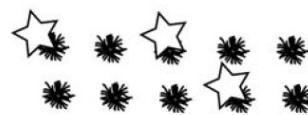

3) Amplify DNA in clonal 'polymerase colony'

4) Sequence DNA by adding liquid reagents to immobilized DNA colonies

5) Interrogate sequence incorporation *in situ* after each cycle using fluorescence scanning or chemiluminescence

454 pyrosequencing ... první komerčně dostupná NGS technologie od srpna 2007

2016 – ohlášené stažení z trhu (Roche)

Široké spektrum technologií

Ale jen některé přežijí

Dnes dostupné NGS platformy

- Roche 454
- **Illumina HiSeq a MiSeq**
- ABI SOLiD
- IonTorrent (Life Technologies)
- SMRT (Pacific Biosciences)
- **Oxford Nanopore**
- ...

Illumina HiSeq/MiSeq

- v současné době nejrozšířenější typ (cca 70%) na trhu
- v horizontu následujících let její používání spíš poroste
- NextSeq, NovaSeq, etc.

https://www.youtube.com/watch?annotation_id=annotation_228575861&feature=iv&src_vid=womKfikWIxM&v=fCd6B5HRaZ8

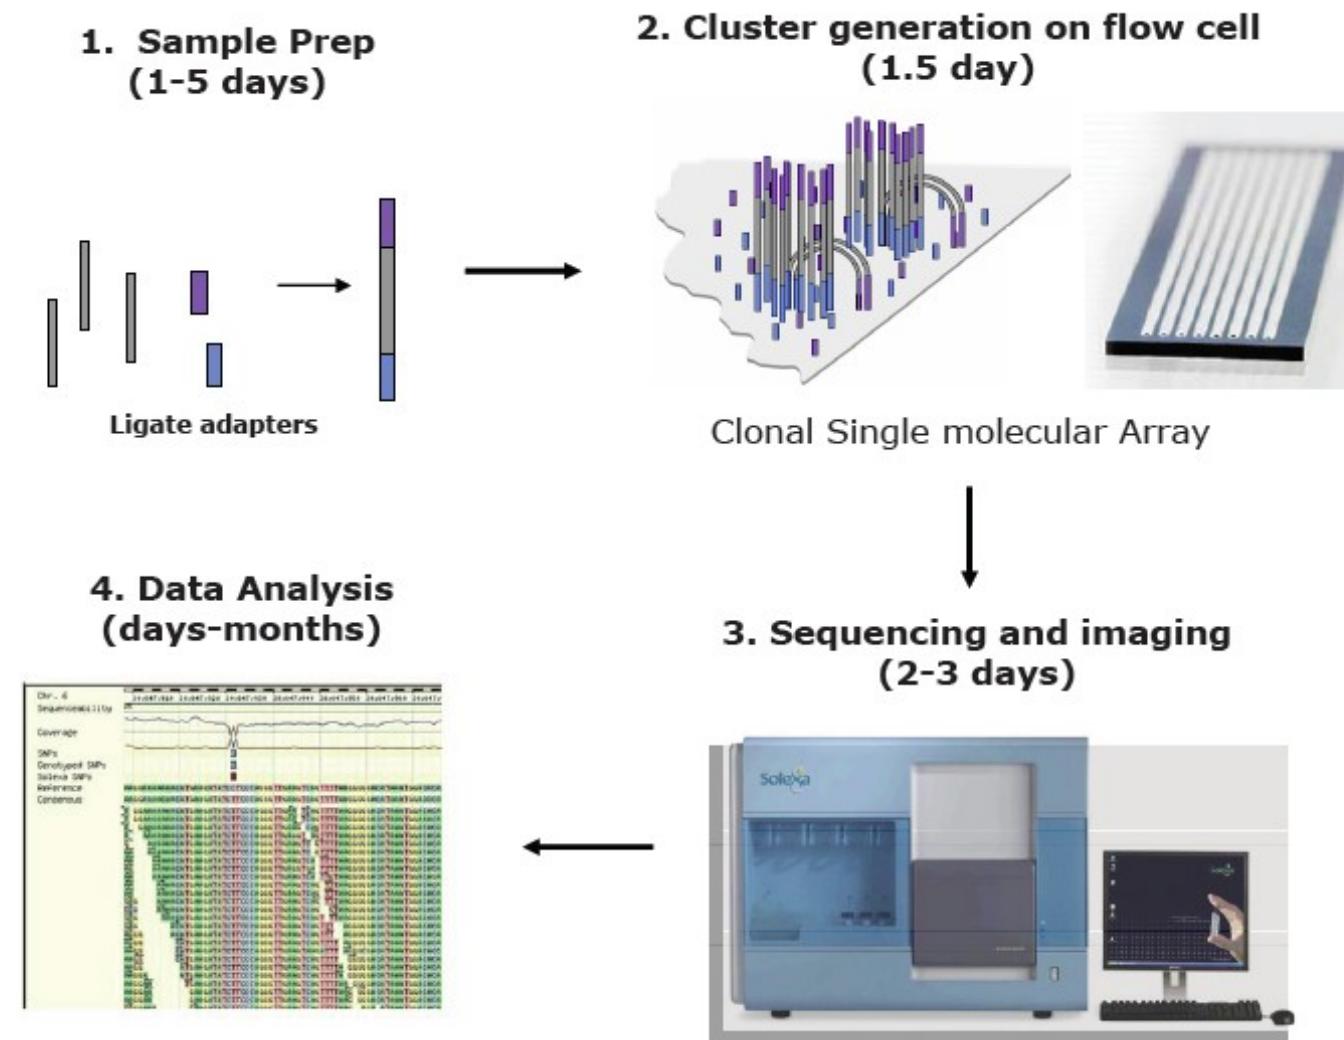

Illumina HiSeq

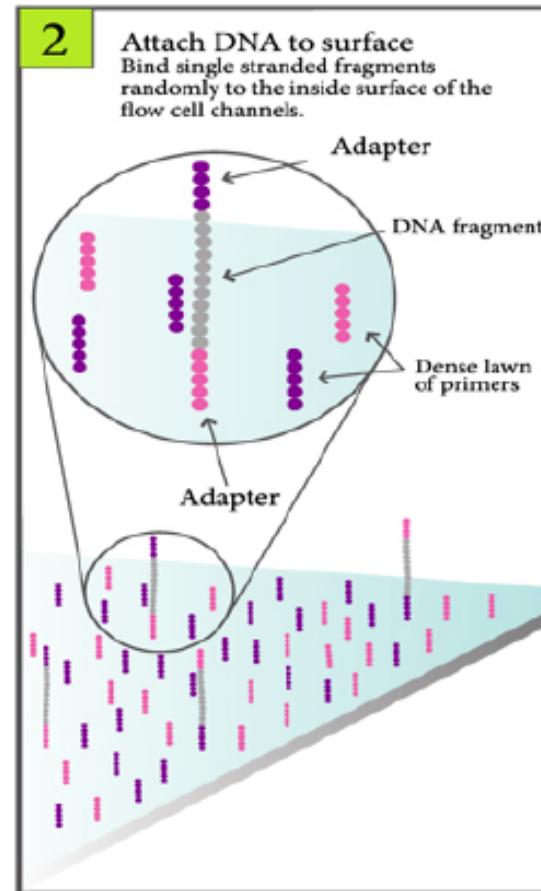

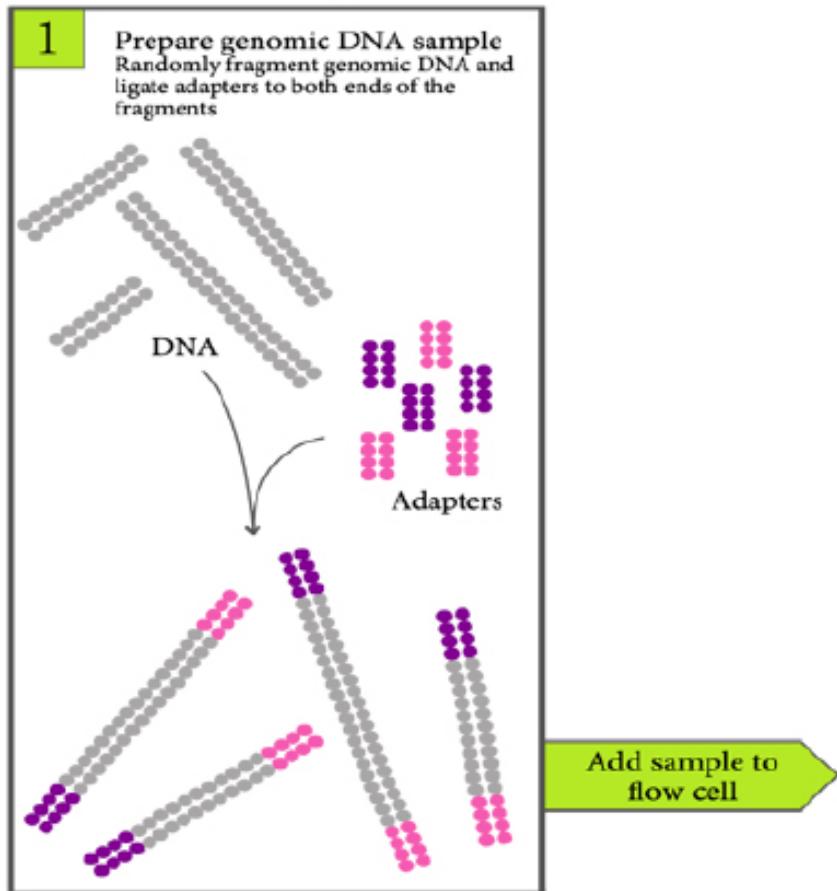

Illumina MiSeq

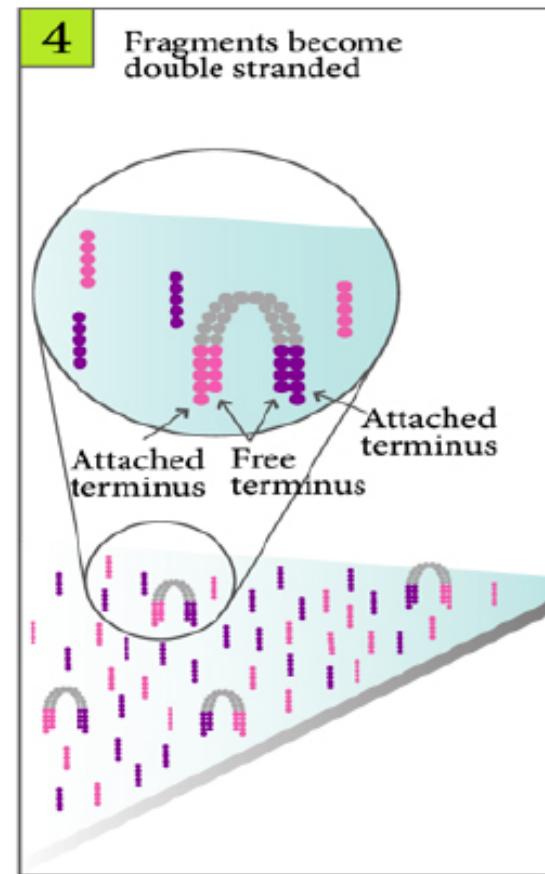

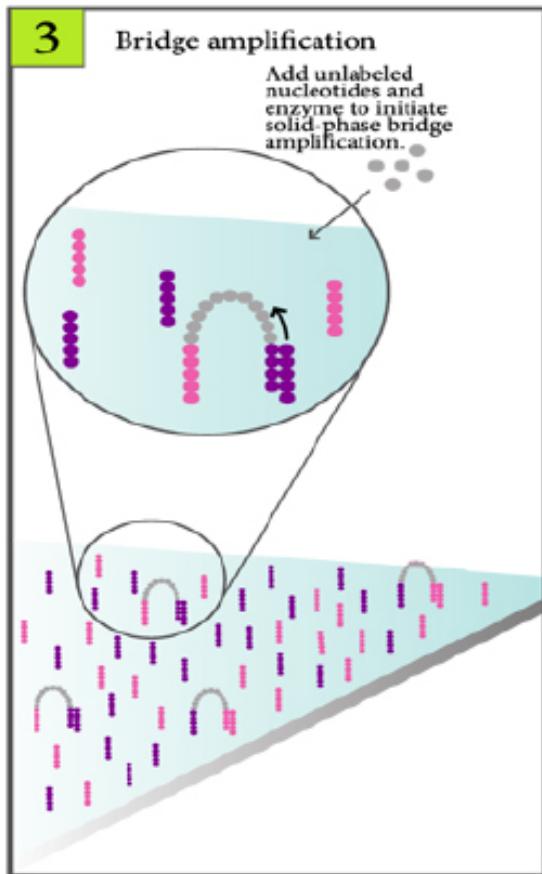

Illumina Sequencing pipeline

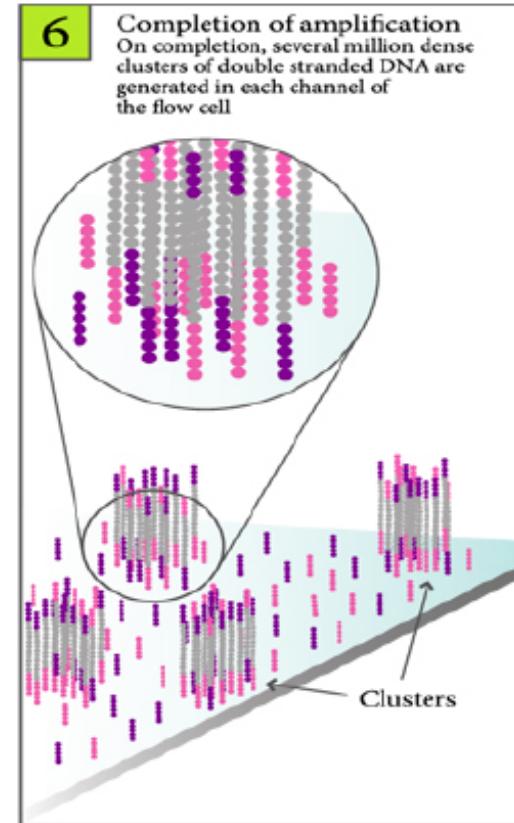

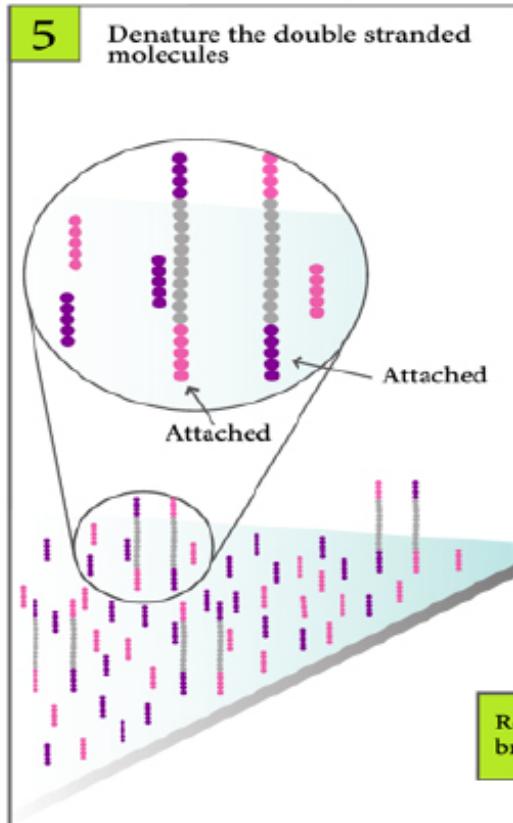

Attach DNA to flow cell

Bridge Amplification

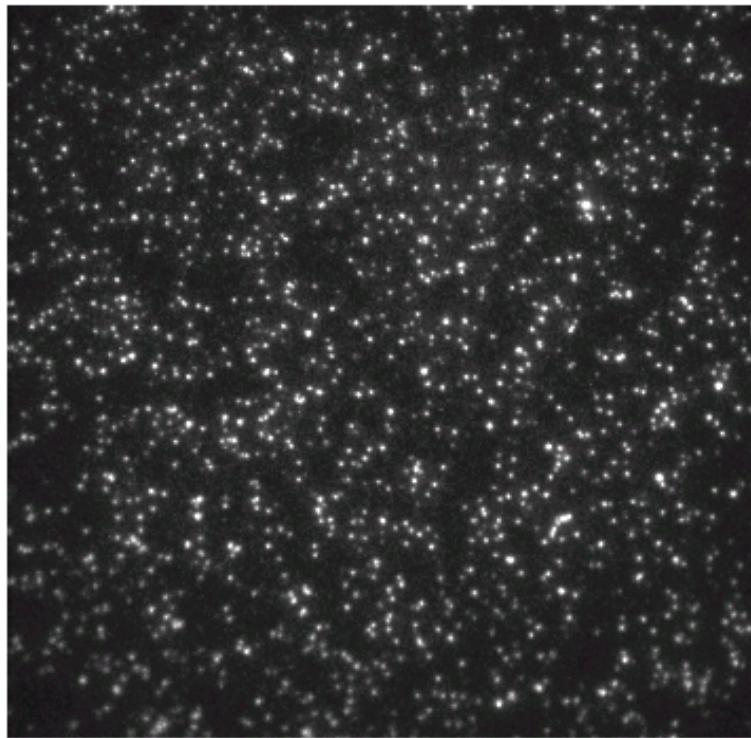

Cluster Generation

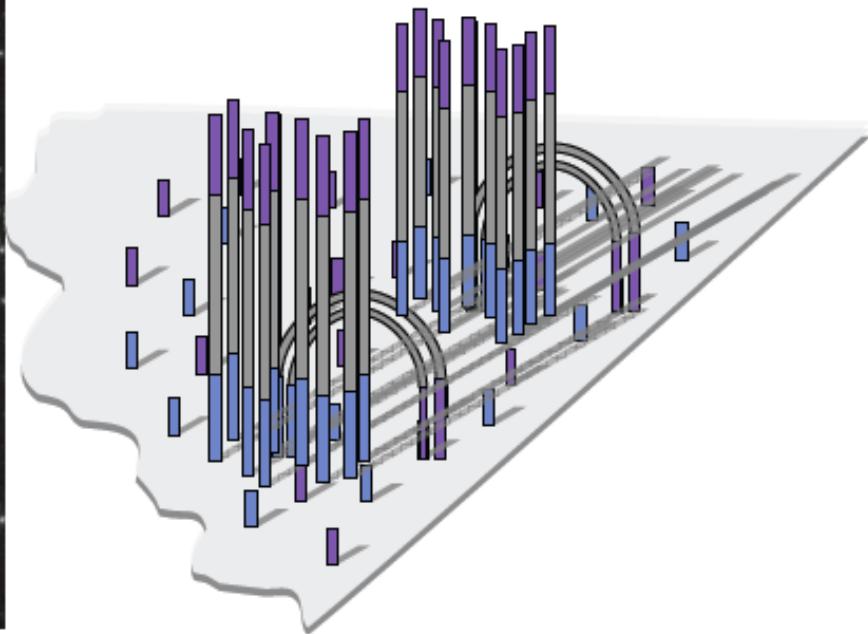

Clonal Single molecular Array

Clonal Single molecule Array

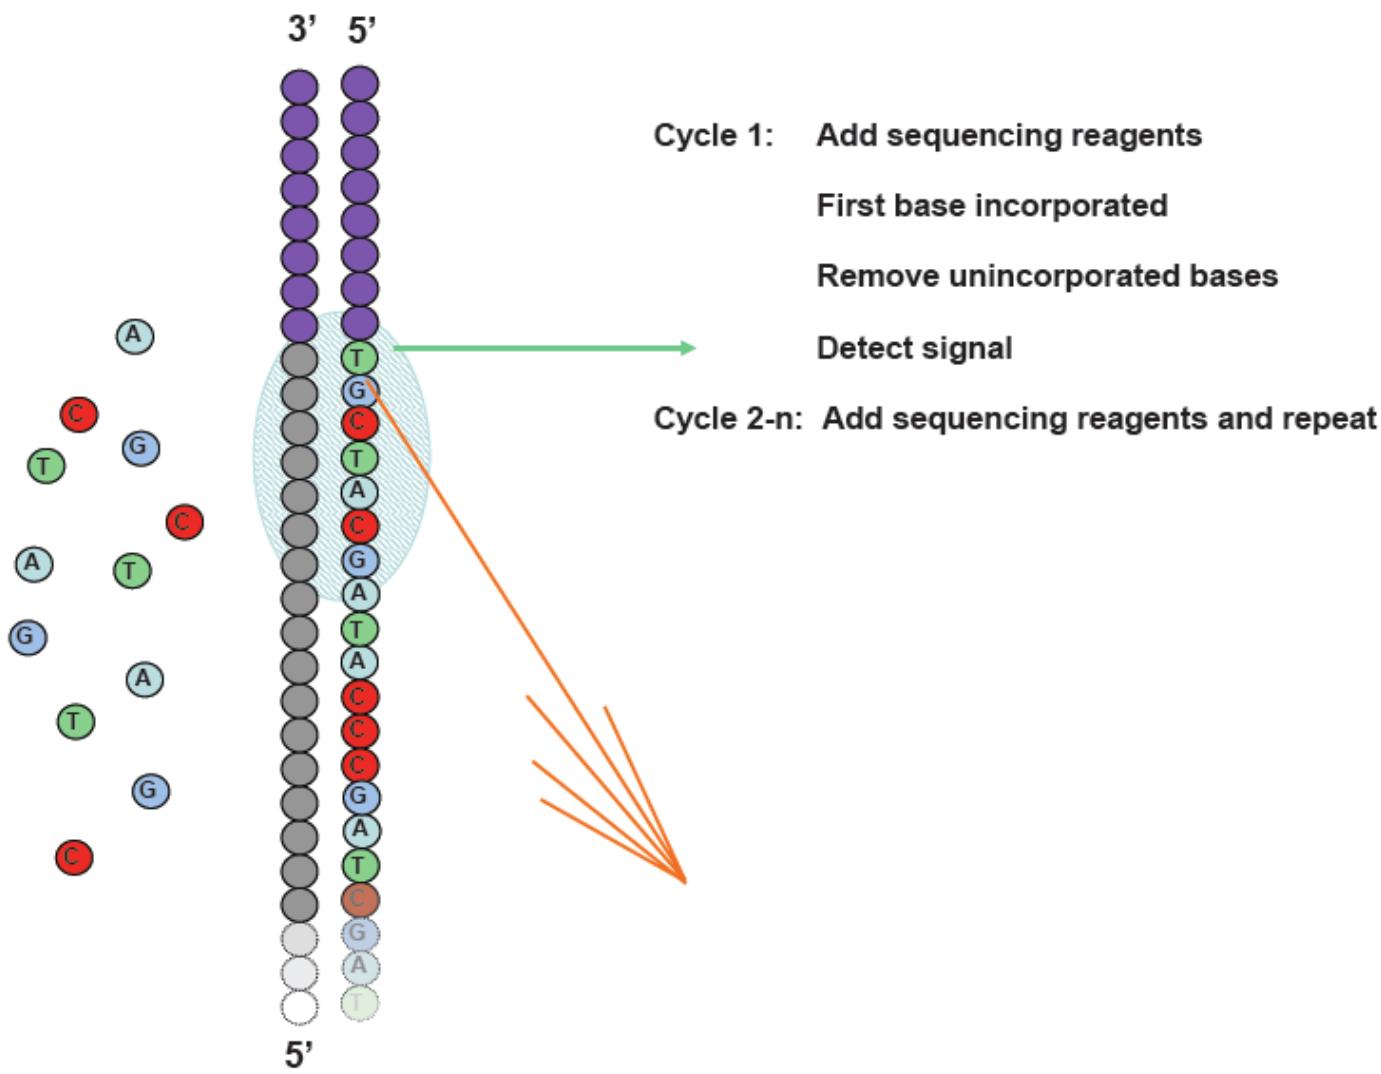

100um

Random array of clusters

**~1000 molecules per ~1 um cluster
~20-30,000 clusters per tile
~40 M clusters per flowcell**

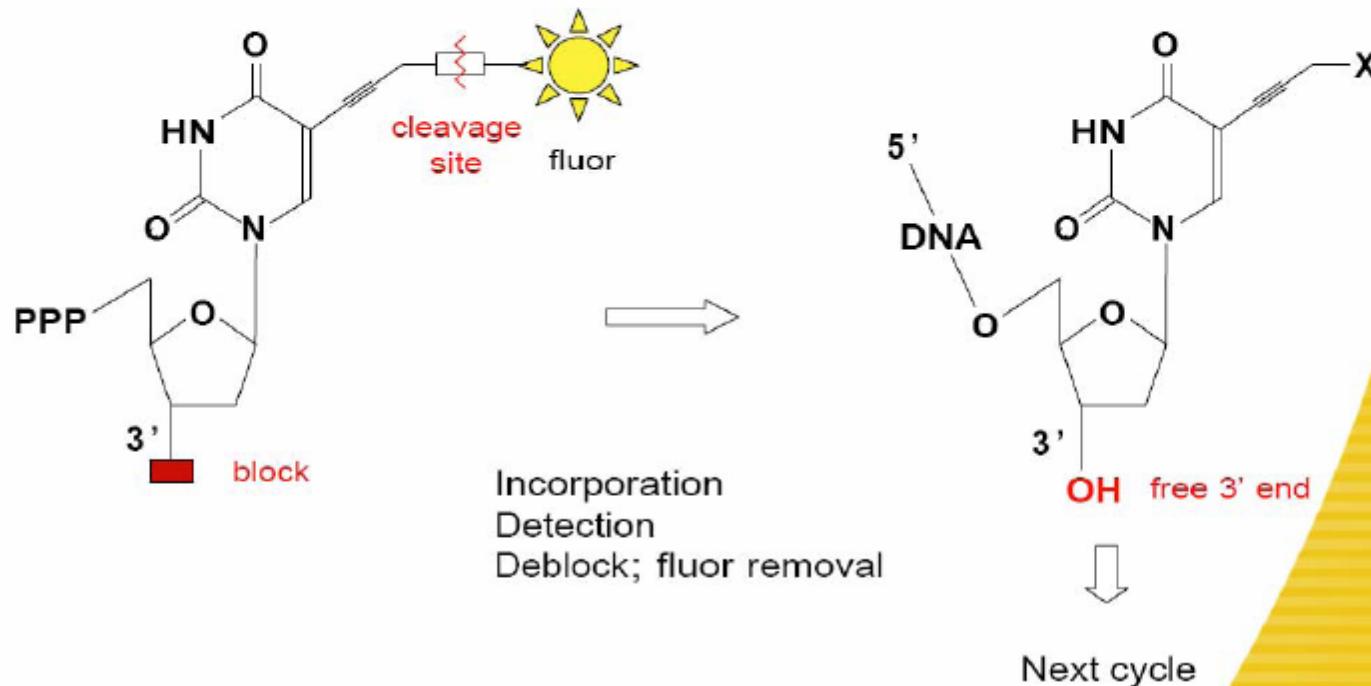

Sequencing By Synthesis (SBS)

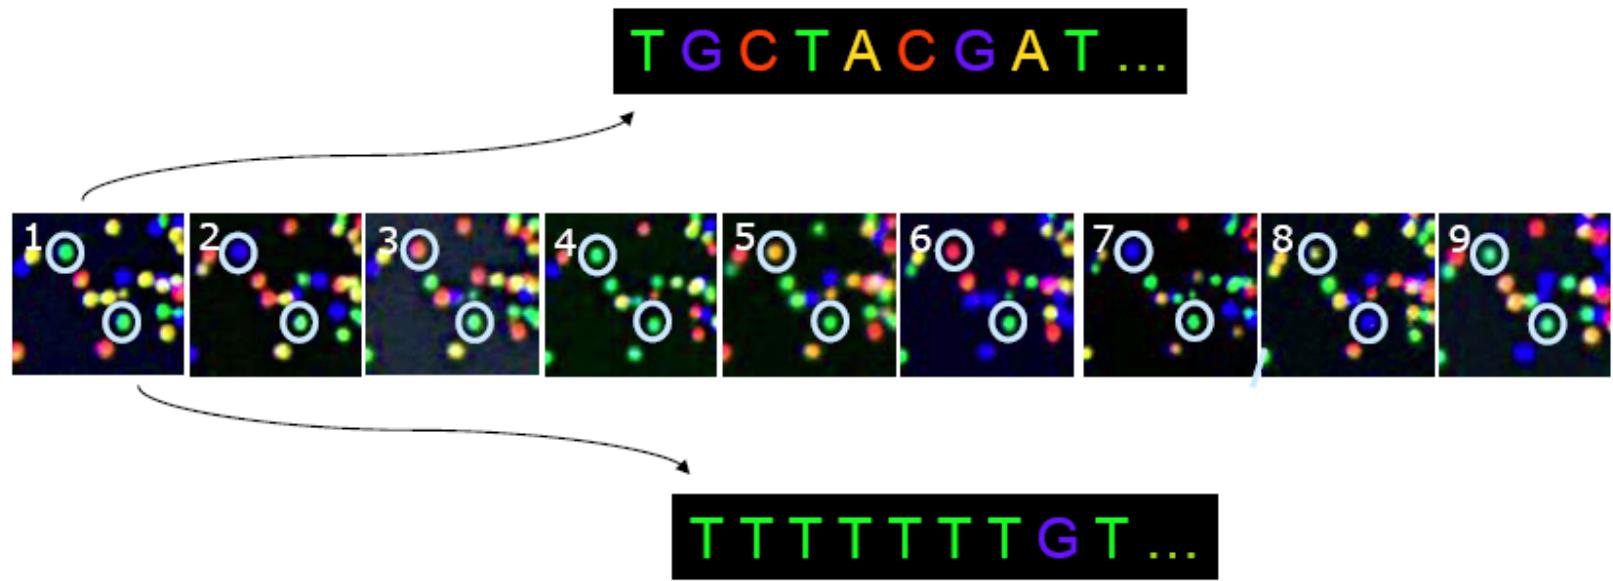

Reversible Terminator Chemistry

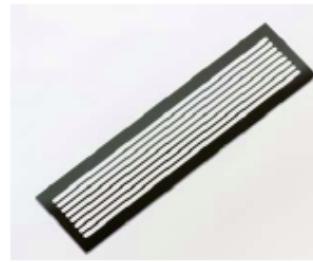

- All 4 labelled nucleotides in 1 reaction
- Higher accuracy
- No problems with homopolymer repeats

Base Calling From Images

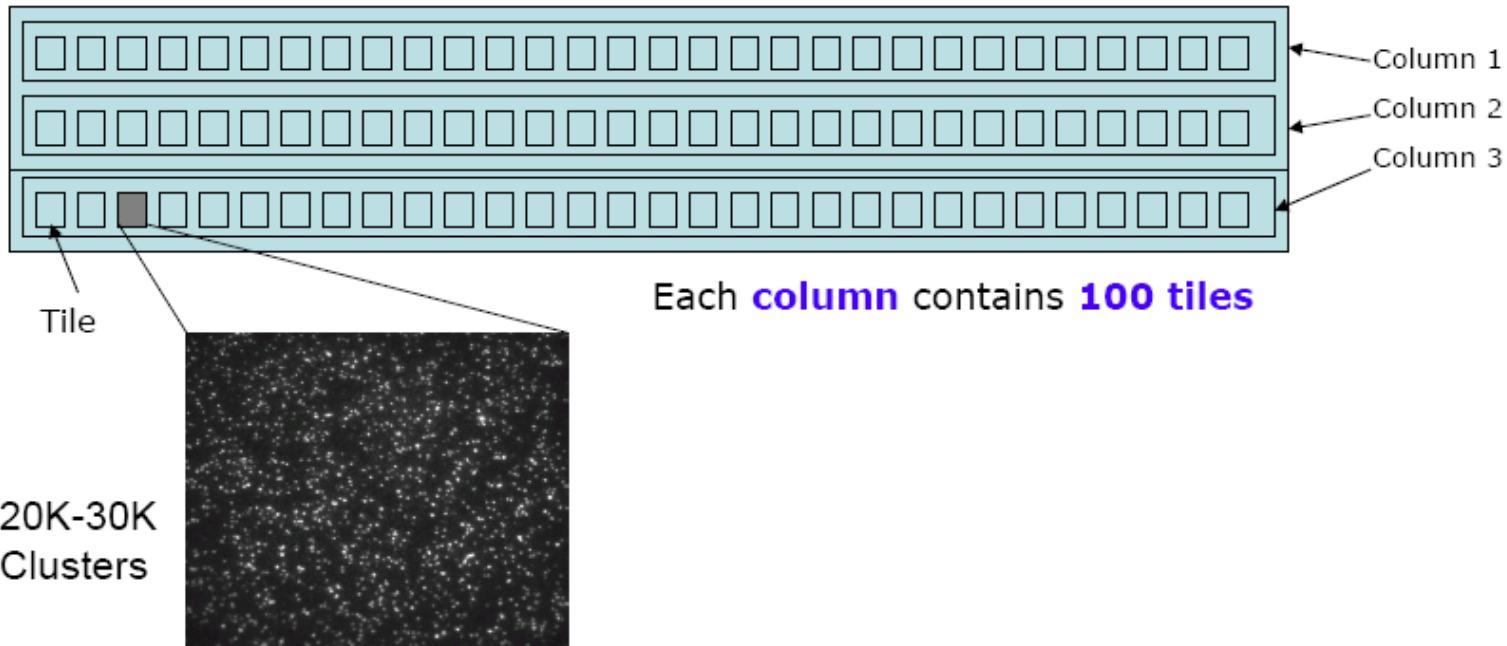

The identity of each base of a cluster is read off from sequential images

A **flow cell** contains eight lanes

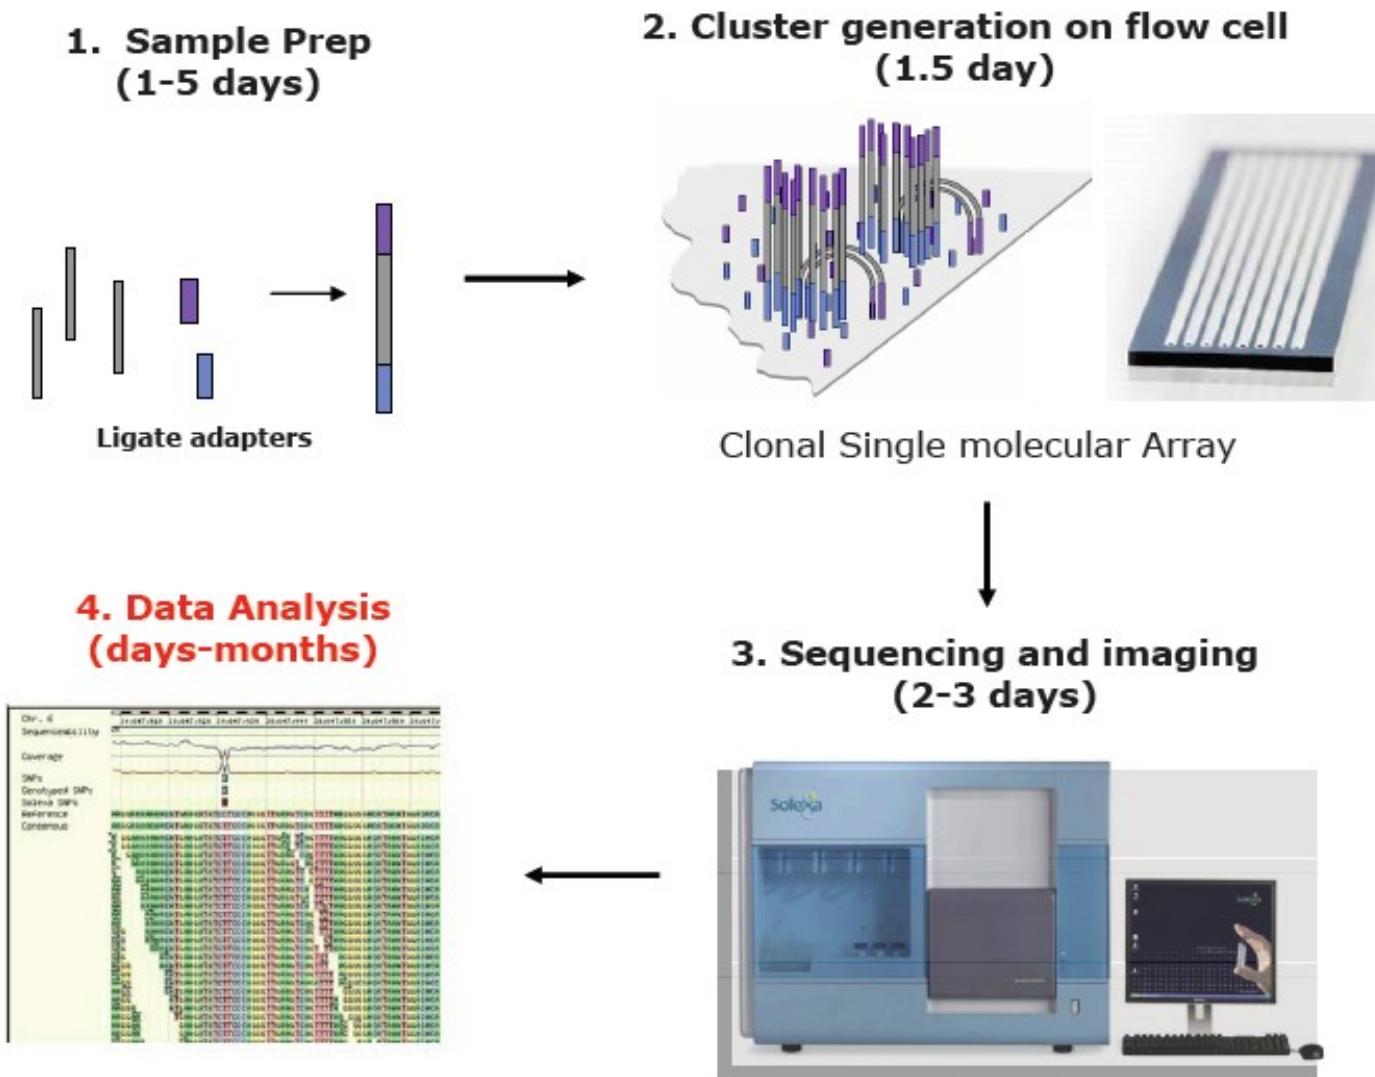

Each **lane/channel** contains **three columns** of tiles

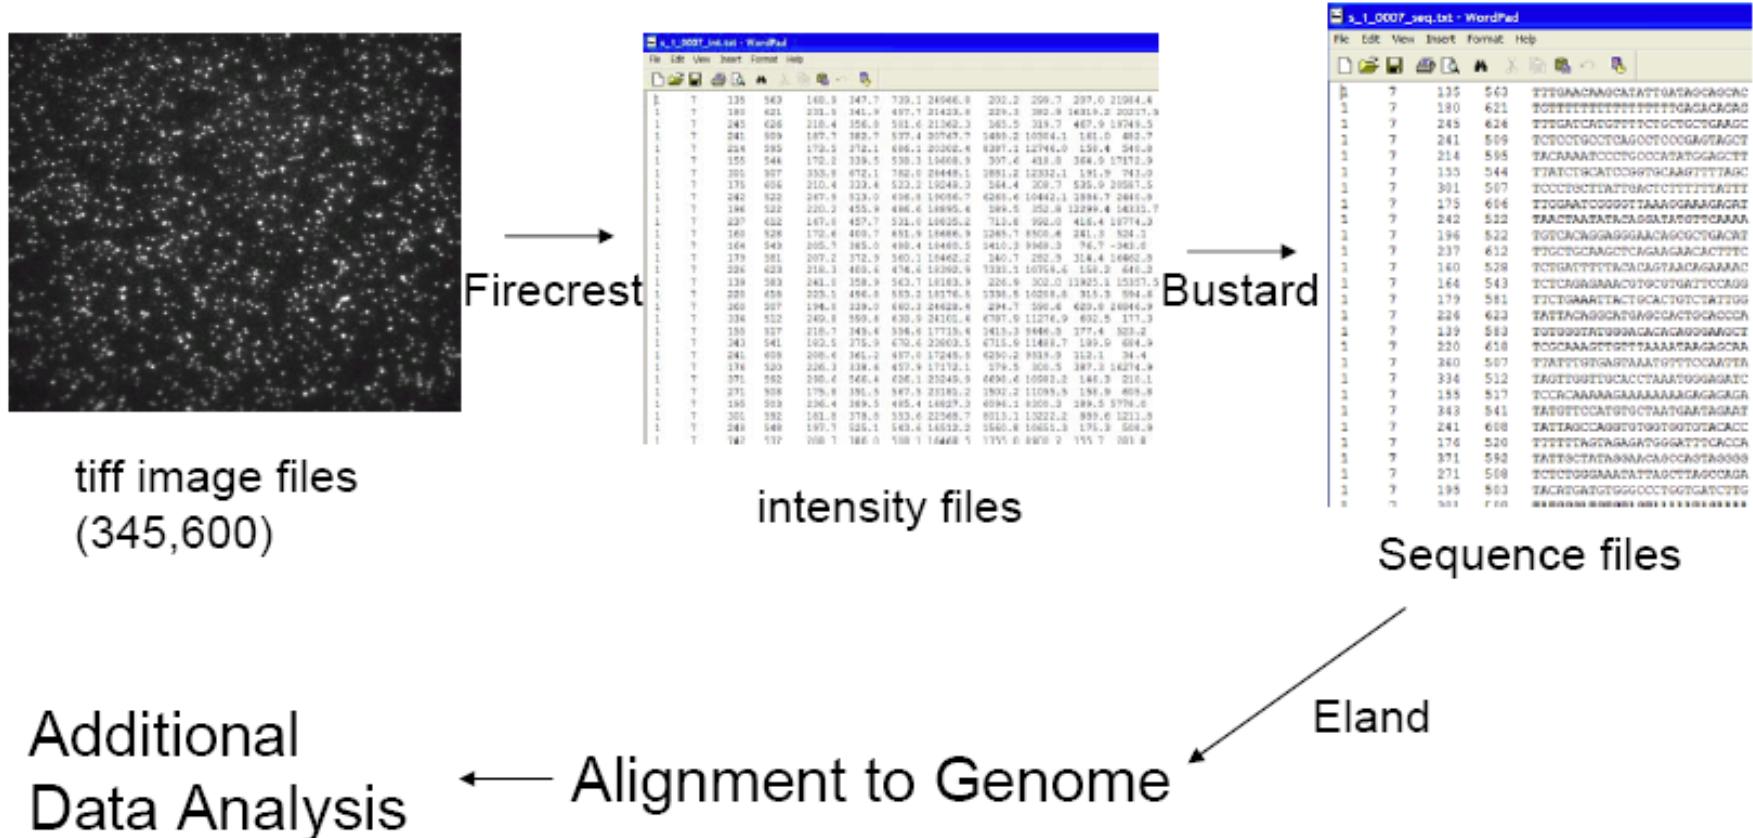

350 X 350 μm

Přehled NGS metod (2012, regularly updated)

Platform	Year	Sequencing Method	Amplification	Detection	Features
454	2005	Pyro-sequencing	Emulsion PCR	Light	First NGS
Illumina	2007	Synthesis	Bridge PCR	Light	90% of Market
SOLiD	2008	Ligation	Emulsion PCR	Light	Lowest Error Rate
Ion Torrent	2010	Synthesis	Emulsion PCR	Hydrogen Ion	Semiconductor Chip
Pacific Biosciences	2010	Synthesis	None = Single Molecule	Light	Anchored Polymerases
Oxford Nanopore	2012	Nanopore	None = Single Molecule	Electrical Conductivity	"Run Until" Sequencing

<https://www.molecularecologist.com/next-gen-fieldguide-2016/>

Výkonnost jednotlivých metod

Instrument	Run time	Millions of Reads/run	Bases / read	Yield MB/run
3730xl (capillary)	2 hrs	0.000096	650	0.06
PacBio RS	2 hrs	0.01	860 – 1,500	5-10
454 GS Jr. Titanium	10 hrs	0.1	400	50
Ion Torrent – 314 chip	2.5 hrs	0.25	200	50
454 FLX Titanium	10 hrs	1	400	400
454 FLX+	20 hrs	1	650	650
Ion Torrent – 316 chip	3 hrs	1.6	200	320
Illumina MiSeq	26 hrs	4	150+150	1200
Ion Torrent – 318 chip	4.5 hrs	4	200	800
Illumina GAIIx	14 days	300	150+150	96,000
SOLiD – 5500xl	8 days	>1,410 ^d	75+35	155,100
Illumina HiSeq 1000	8.5 days	≤1500	100+100	≤300,000
Illumina HiSeq 2000	11.5 days	≤3000	100+100	≤600,000

Chybovost jednotlivých metod

Platform	Primary Errors	Single-pass Error Rate (%)	Final Error Rate (%)
3730xl (capillary)	Substitution	0.1-1	0.1-1
454	Indel	1	1
Illumina	Substitution	~0.1 (85% of reads)	~0.1 (85% of reads)
SOLiD	A-T bias	~5	≤0.1
Ion Torrent	Indel	~1	~1
PacBio RS	CG deletions	~15	≤15
Oxford Nanopore	Deletions	≥4	4

Traditional Sequencing vs. Next Generation Sequencing: Data Throughput

1 x Illumina GAI

200+ of 3730xl

Vs.

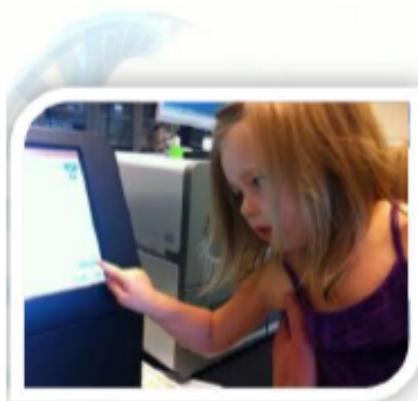

Days vs. Years

The Sequencing Landscape is Changing

Bioinformatika - největší brzda dalšího rozvoje

Basically, analyzing genomes in interaction with their environment is now feasible and accessible to anyone

Sekvenační strategie

- nutno velmi dobře počítat než se začne sekvenovat
- celkový výtěžek sekvenování = **počet „reads“ * délka „reads“ * coverage**
- zásadně závisí na konkrétním cíli výzkumu a použité technologii

Benchtop Sequencers

Sekvenační strategie

...JEDEN VZOREK NA RUN JE MÁLO

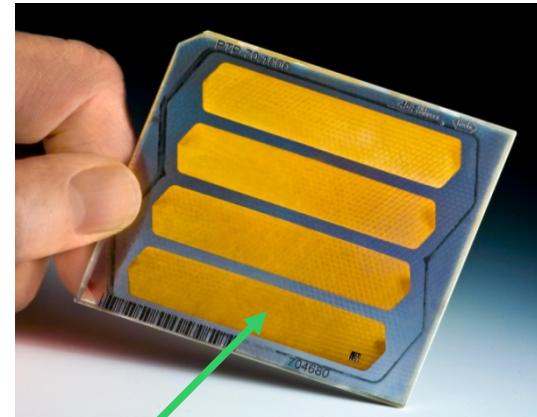

Kapilární sekvenátor

U kapilárních sekvenátorů není problém přiřadit sekvenci k jednotlivým vzorkům na základě pozice na platíčku

Sekvenátor druhé generace

U sekvenátorů druhé generace se najednou sekvenuje pool desítek až stovek vzorků

Sekvenační strategie

...JEDEN VZOREK NA RUN JE MÁLO

Jednotlivé vzorky pro sekvenátory druhé generace se značí tzv. barcody (midy, tagy)

Krátká (obvykle 6-12bp) oligonukleotidová sekvence před primerem (pokud sekvenujeme PCR amplikon), která je specifická pro daný vzorek

Přiřazení identity jednotlých sekvencí k vzorkům probíhá bioinformaticky

BARCODE PRIMER SEQUENCE

<u>A</u> GC GTAGGT CATT CGAT GCGG TCA TGCCTGG ATTAA AGCT.....

TGC GCAGGT CATT CGAT GCGG TCA TGCCTGG ATTAA AGCT.....		
TGC GTTGGT CATT CGAT GCGG TCA TGCCTGG ATTAA AGCT.....		

Sekvenační strategie

AMPLIKONOVÉ SEKVENOVÁNÍ (amplikony kratší než délka readů)

SHOT GUN SEKVENOVÁNÍ

LONG-RANGE PCR + SHOT GUN (amplikony delší než délka readů)

COMPLETE GENOME (e.g. viral genome from enriched samples)

REDUCED GENOME

- **PCR** amplicons
- Enriched libraries by **hybridization** (development of microsatellite markers, exom, anchored phylogenomics, UCE = ultraconserved elements, etc.)
- Enriched libraries by **restriction enzymes** (RAD sequencing)
- RNAseq (**transcriptomics**)

Sekvenační strategie

AMPLIKONOVÉ SEKVENOVÁNÍ

PCR Amplifikace konkrétního úseku daného genomu pomocí specifických primerů (se sekvenačními adaptory)

Následná sekvenace

Taxonomické složení daného vzorku („metabarcoding“), variabilita konkrétních genů apod.

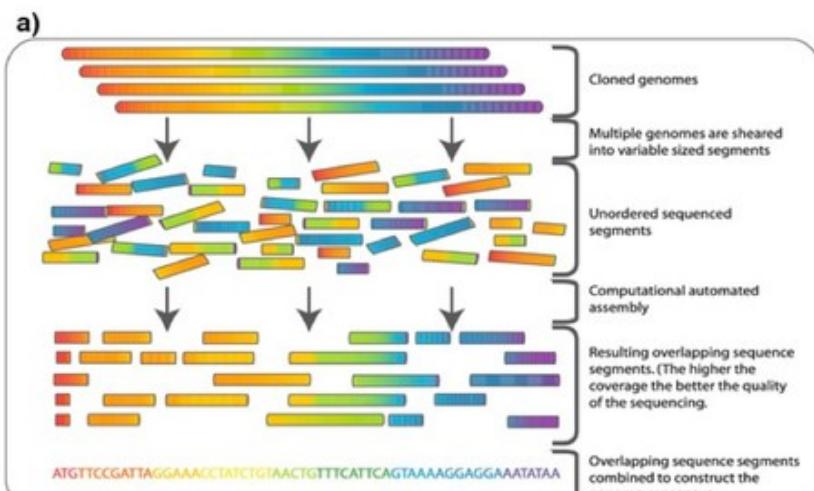

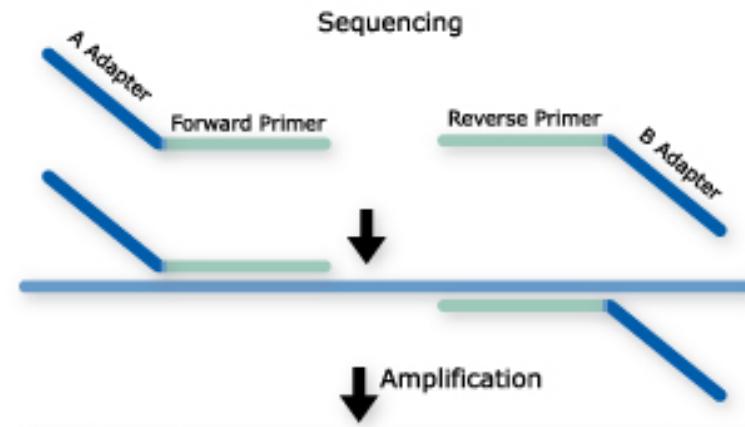

SHOT GUN SEKVENOVÁNÍ

Fragmetace celogenomové DNA

Ligace sekvenačních adaptorů

Následná sekvenace náhodných fragmentů

De novo assembly, resekvenování, transkriptomika, funkční složení daného společenstva

Sekvenační strategie

LONG RANGE PCR + SHOT GUN

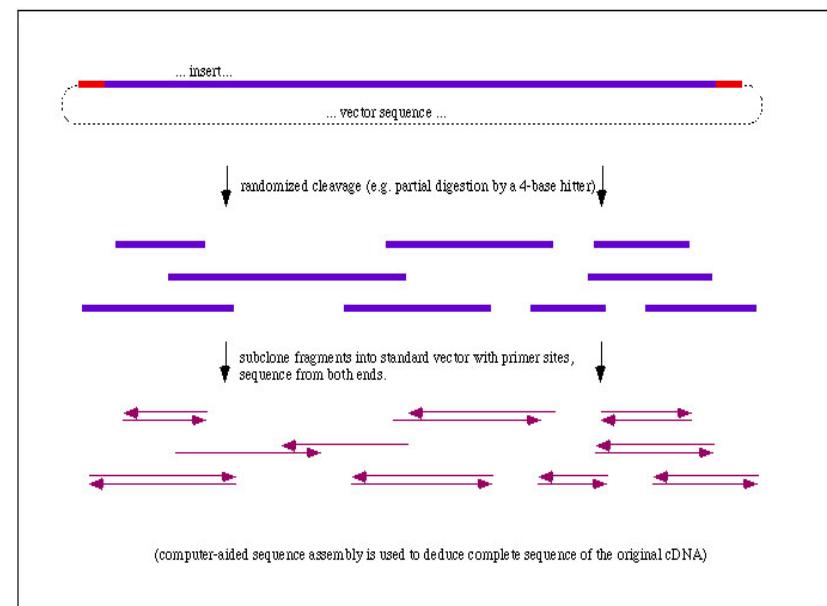

Dlouhé PCR produkty, které nejdou vcelku osekvenovat

Jejich fragmentace

Sekvenování fragmentů

Zpětná rekonstrukce původní sekvence („assembly“)

Použitelné pokud nás zajímá variabilita v jednolitém úseku DNA. Např. sekvenace kompletní mitochondrální DNA (3 různé PCR produkty).

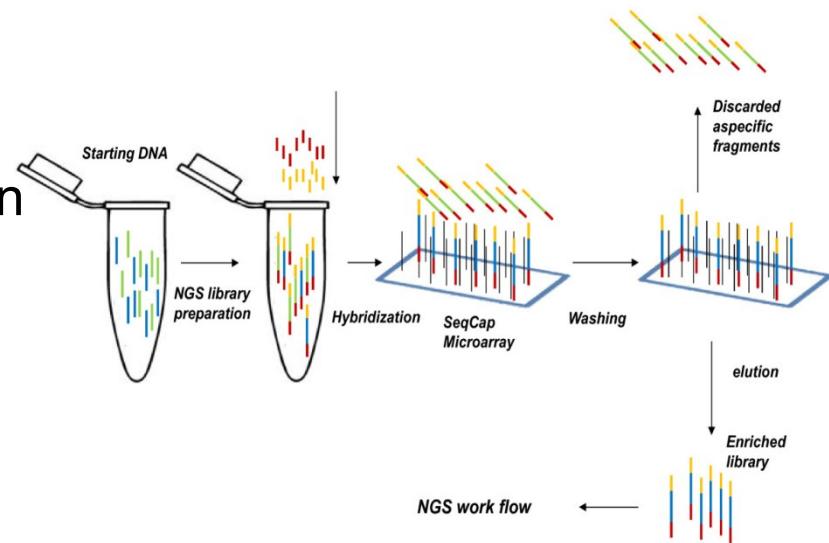

Sekvenační strategie

Enrichment by hybridization + shot gun

Separace úseků genomu které nás zajímají na základě jejich hybridizace

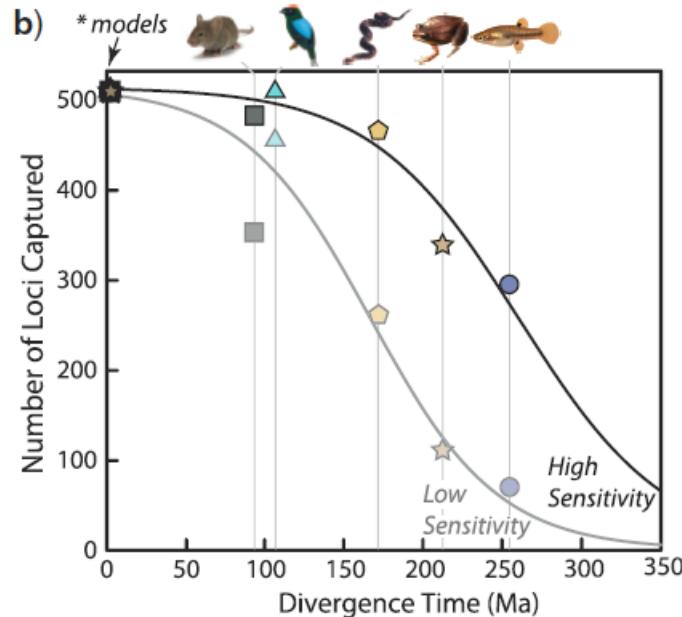

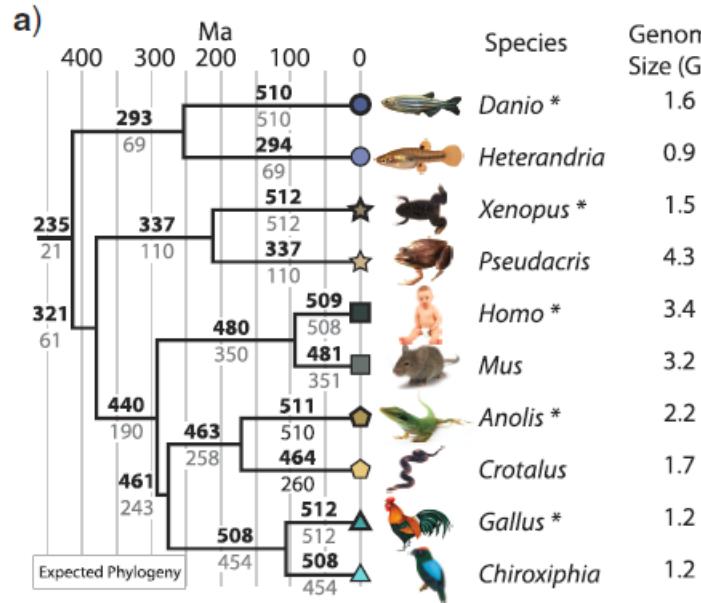

Následná sekvenace obohacených knihoven („enrichment“)

Nové markery (mikrosatelity apod.), kódující oblasti genomu („exom“), „anchored phylogenomics“ apod.

Anchored phylogenomics

- hundreds of conserved loci
- hybridization enrichment
- u velmi příbuzných taxonů bude málo variability

CENTER FOR
ANCHORED PHYLOGENOMICS
ACCELERATING THE RESOLUTION OF LIFE™

Nature Paper Resolves Bird Tree of Life

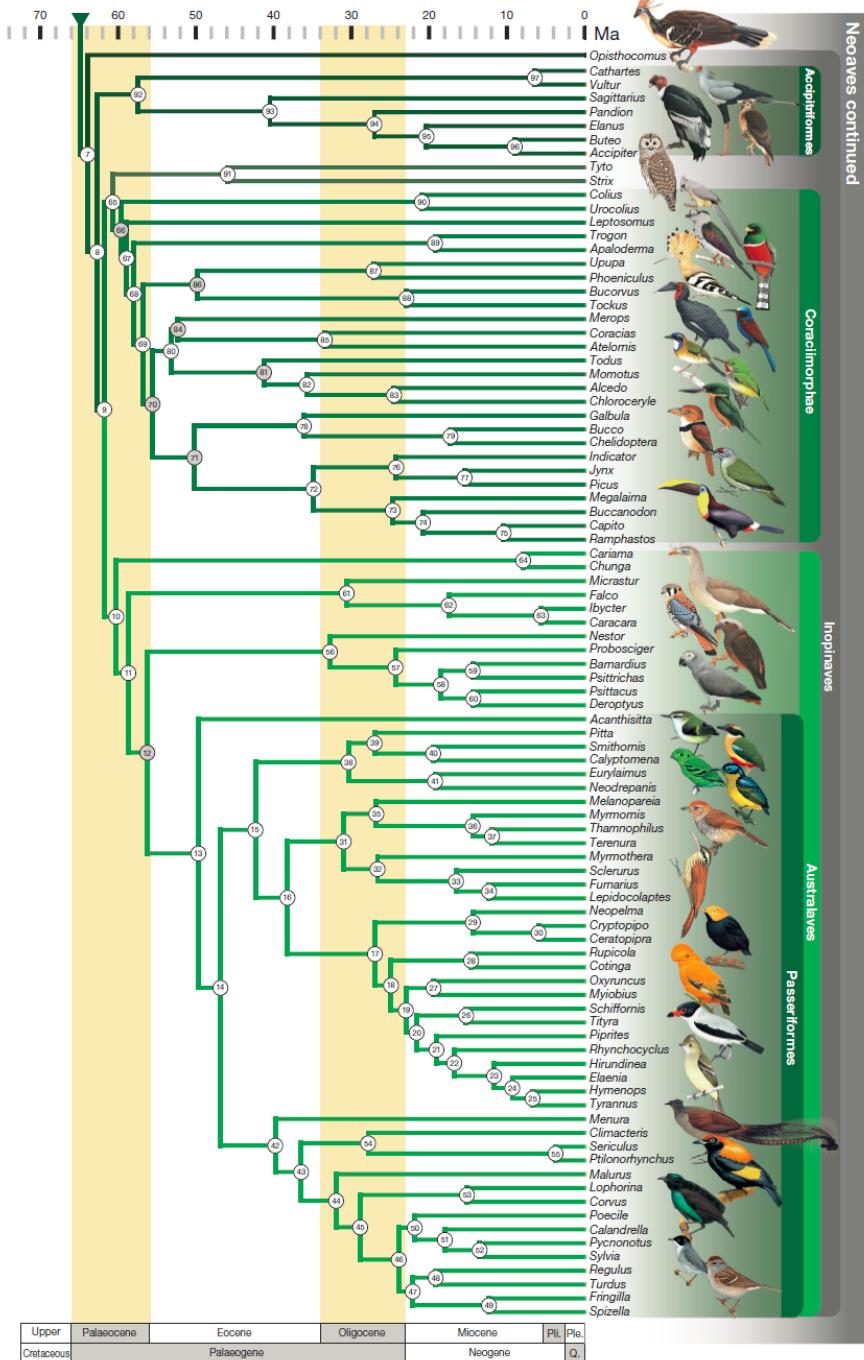

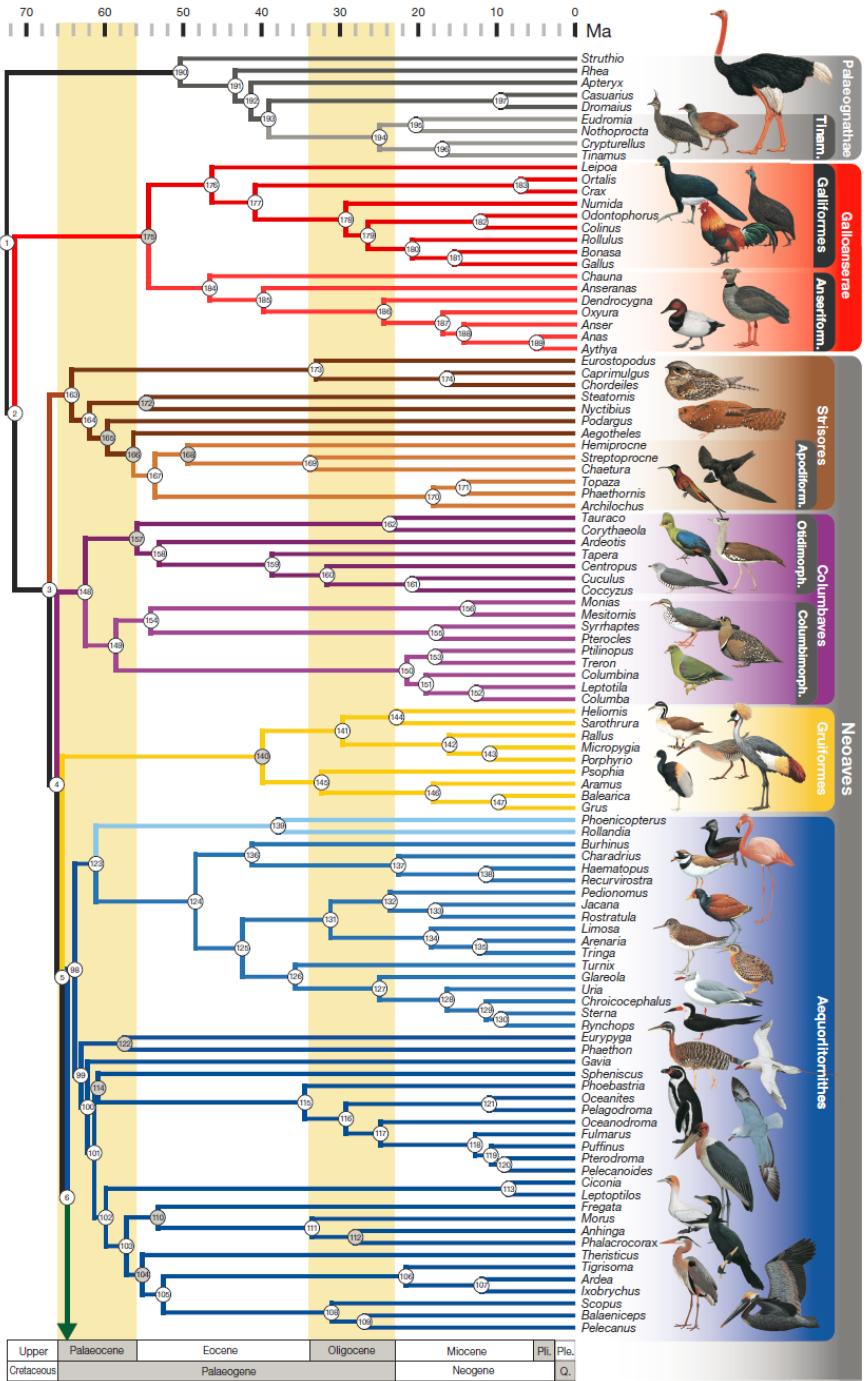

October 2015

Posted on October 6, 2015 by ameer

198 species

259 nuclear loci (ca 1500 bp each)

> 390 000 bp

Aves

Neoaves continued

Sekvenační strategie

Sekvenování podél restrikčních míst (Enriched libraries by restriction enzymes)

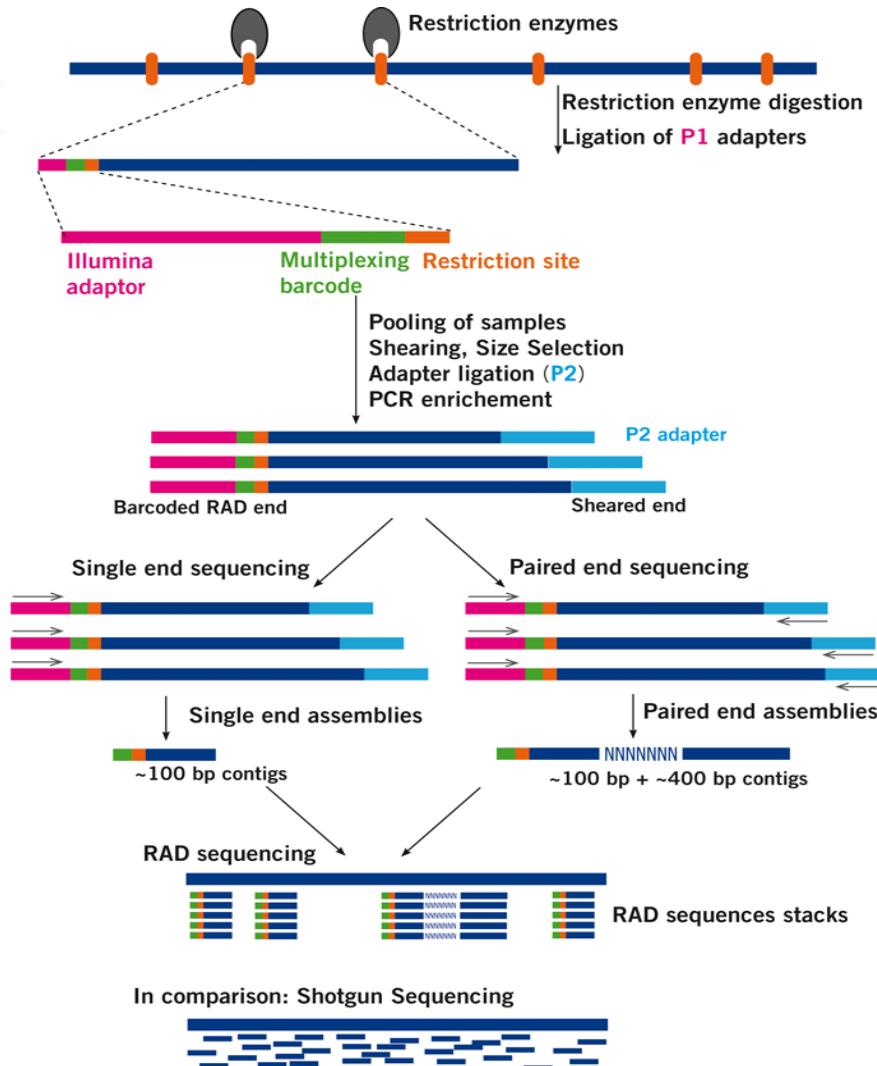

Fragmetace gelogenomové DNA pomocí restrikčních enzymů

Ligace sekvenačních adaptérů na výsledné fragmenty

Následná sekvenace podél restrikčních míst

Celogenomové scany genetické variabilit

Hledání SNPs, populační genomika (např. RAD-SEQ) apod.

RAD vs. ddRAD

A

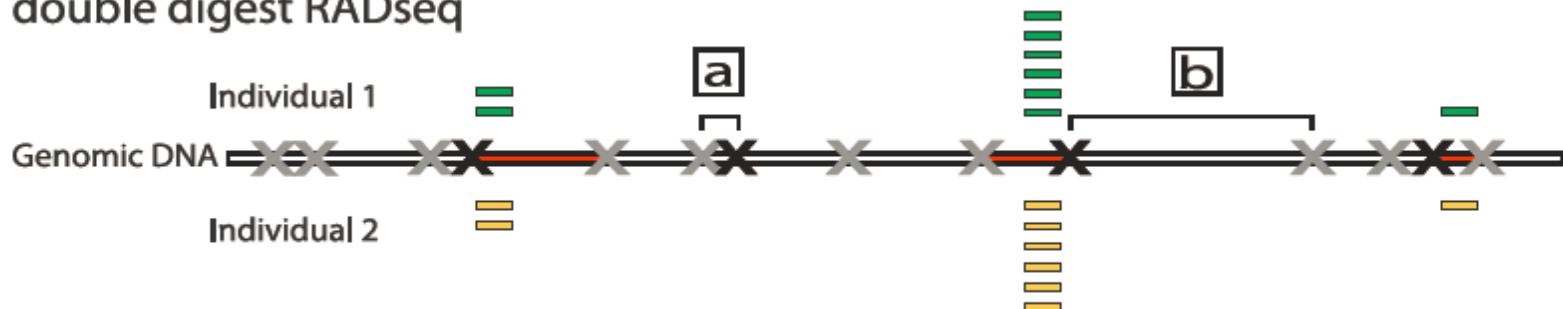

RAD sequencing

✗ Rare cut site
✗ Common cut site
— Genomic interval present in library
— Sequence reads

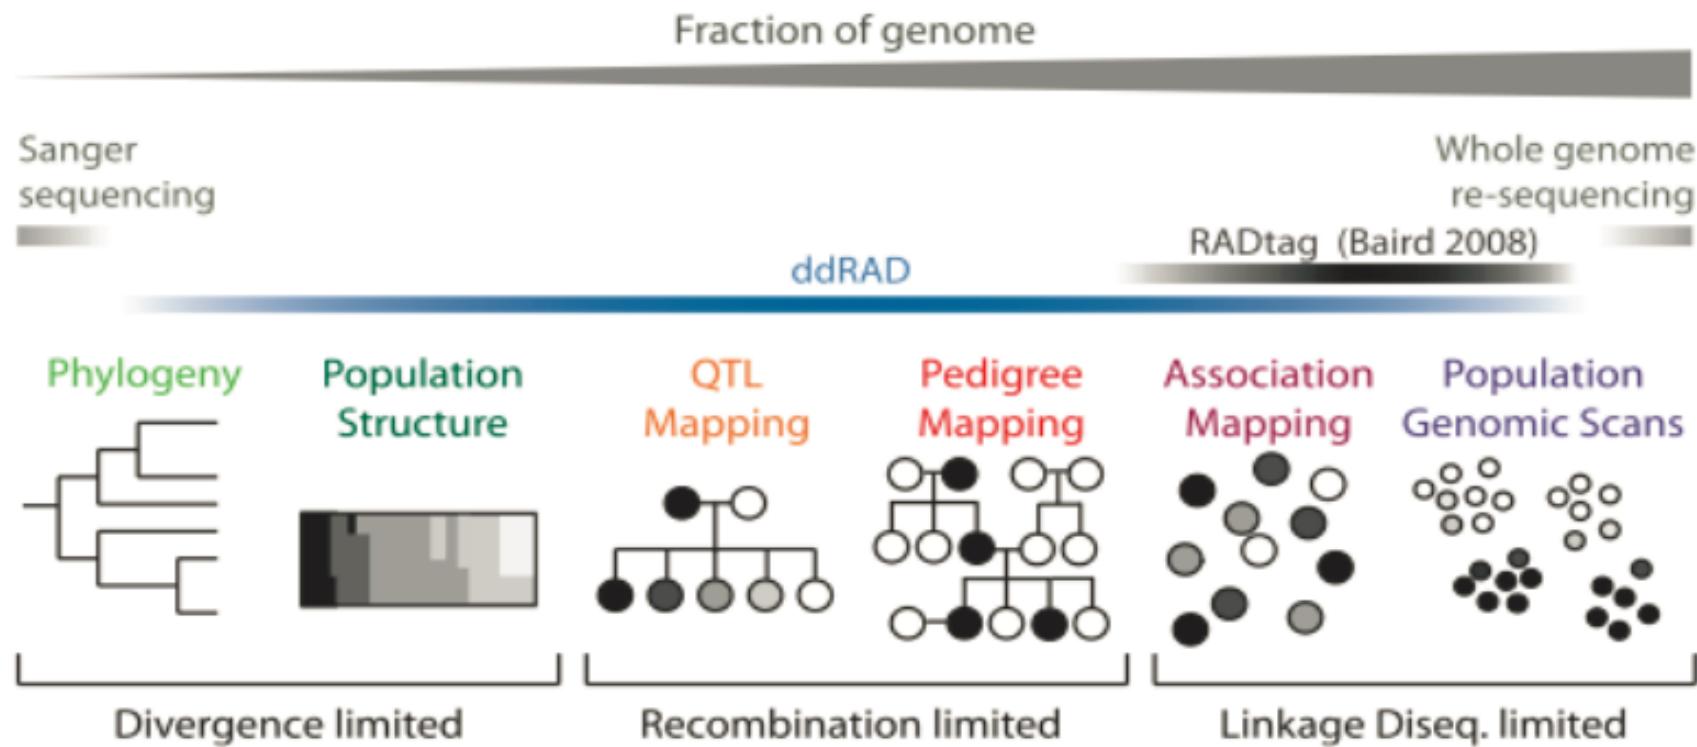

B

double digest RADseq

Sekvenování podél restrikčních míst

ddRAD library

o tuto sekvenci nám jde!

SOFTWARE AVAILABLE:

Stacks, dDocent, iPyrad

iPyrad denovo assembly workflow (no reference genome)

program Skewer

program iPyrad

Aplikace

1. Celogenomové sekvenování de novo
2. Celogenomové resekvenování
3. Sekvenování amplikonů (PCR produktů)
4. Další aplikace - např. hledání klasických DNA markerů (mikrosatelity, SNPs)

1. Celogenomové sekvenování de novo

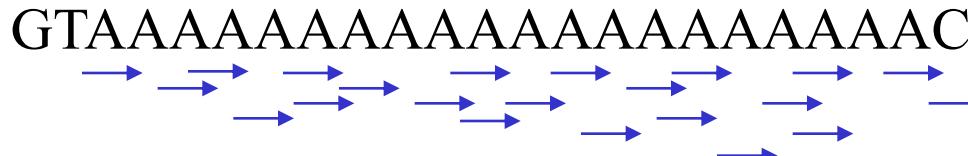

Problém: KRÁTKÝ READ LENGTH

- max 300bp u Illumina, 35-75bp Solid
vs 800-1000bp Sanger
- nové technologie (PacBio, Nannopore) už s tím takový problém nemají

→ Uspořádání (assembly) ještě stále může být problém z hlediska výpočetní kapacity

!!!!!! REPETITIVNÍ OBLASTI delší než read length !!!!!

Zvláště komplexní eukaryotické genomy - úseky souvislých oblastí přerušených mezerami

1. Celogenomové sekvenování de novo

- získání kompletní uspořádané sekvence celých velkých eukaryotních genomů pomocí next-generation sequencing de novo je problém (ale to je nakonec i u Sangera)
- viry, prokaryota, malá eukaryota, mitochondrie/plastidy/plasmidy

Genetic Detection of Lujo Virus, a New Hemorrhagic Fever in Southern Africa

Thomas Briese^{1,2*}, Jan Gustavo Palacios¹, Maia M. Mills³, Stuart T. Nichol³, W. Ian Lipkin⁴, and Christopher D. Goldsmith⁵

¹ Center for Infection and Immunity, ² National Institute for Communicable Diseases, ³ Rocky Mountain Laboratories, Centers for Disease Control and Prevention, ⁴ Department of Epidemiology, Columbia University, ⁵ Biotechnology Core Facility, University of Texas Health Science Center at San Antonio

Abstract

Lujo virus (LUJV), a new Old World discovered in nosocomial transmission extracts from serum arbovirus isolates. LUJV is a novel, genetically distinct, highly pathogenic arenavirus.

b

2009

2015

2. Celogenomové resekvenování

- podobné problémy jako u de novo, ale méně (větší strukturální přestavby..)

KOMPARATIVNÍ GENOMIKA

- viry, prokaryota, malá eukaryota
- mitochondrie/plastidy/plasmidy

ANCIENT (mt) DNA

- různé směsné, degradované vzorky, např. fosilie

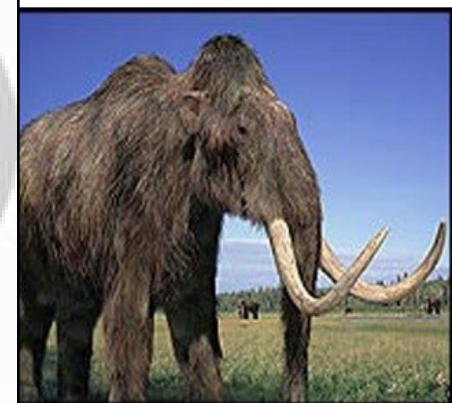

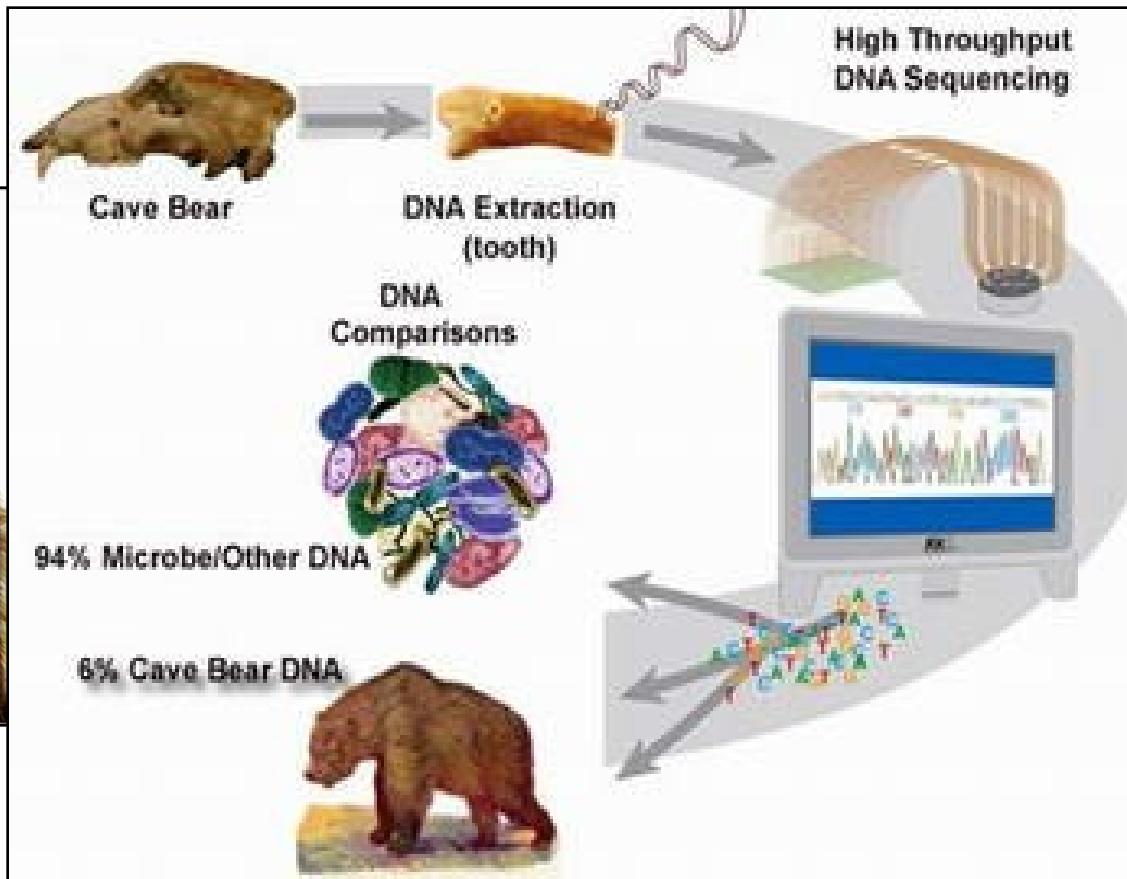

A Complete Neandertal Mitochondrial Genome Sequence Determined by High-Throughput Sequencing

Richard E. Green,^{1,*} Anna-Sapfo Malaspinas,² Johannes Krause,¹ Adrian W. Briggs,¹ Philip L.F. Johnson,³ Caroline Uhler,⁴ Matthias Meyer,¹ Jeffrey M. Good,¹ Tomislav Maricic,¹ Udo Stenzel,¹ Kay Prüfer,¹ Michael Siebauer,¹ Hernán A. Burbano,¹ Michael Ronan,⁵ Jonathan M. Rothberg,⁶ Michael Egholm,⁵ Pavao Rudan,⁷ Dejana Brajković,⁸ Željko Kučan,⁷ Ivan Gišić,⁷ Mårten Wikström,⁹ Liisa Lakkonen,¹⁰ Janet Kelso,¹ Montgomery Slatkin,² and Svante Pääbo¹

Ancient Genomes Resurrected

- Degraded state of the sample → mtDNA sequencing
- Nuclear genomes of ancient remains: cave bear, mammoth, Neanderthal (10^6 bp)

Problems: contamination modern humans and coisolation bacterial DNA

3. Sekvenování amplikonů (PCR produktů)

SMĚSNÉ VZORKY - paralelní sekvenování nahrazuje klonování

Metagenomika (= hlavně prokaryota)

- Celé společenstvo půdních, vodních mikroorganismů, střevní mikroflóra - **mikrobiom**
- PCR genu 16S rRNA
- lze i kvantifikovat

Metabarcoding (= hlavně eukaryota, ale dnes používáno jako obecný termín)

- COI gen, příp. jiný barcodingový marker
- složení potravy, monitoring společenstev

Metabarcoding: Taxonomické složení společenstva v environmentální DNA na základě taxonomicky informativního úseku DNA (cyt b, COI, ITS, rRNA...)

Princip

- Směsný vzorek environmentální DNA
- Amplifikace pomocí primerů specifických pro cílovou skupinu, pokrývající taxonomicky informativní úsek (COI, 16s/18s RNA...)
- Paralelní sekvenování
- Filtrování nekvalitních sekvencí
- Klastrování na základě sekvenční podobnosti do OTUs („operational taxonomic units“)
- Jejich taxonomické zařazení na základě referenčních databází

Využití: Analýza druhového vzorku kde lze makroskopicky jednotlivé druhy obtížně odlišit

- Potravní analýza z trusu
- Vzorky půdy
- Mikrobiální společenstva
- Permafrost
- Exotická/špatně probádaná společenstva
- Druhově bohatá společenstva („insect traps“ v tropech)
- Rutinní analýza velkého množství vzorků

Metabarcoding

Taxonomické složení společenstva na základě taxonomicky informativního úseku DNA

Alternativy:

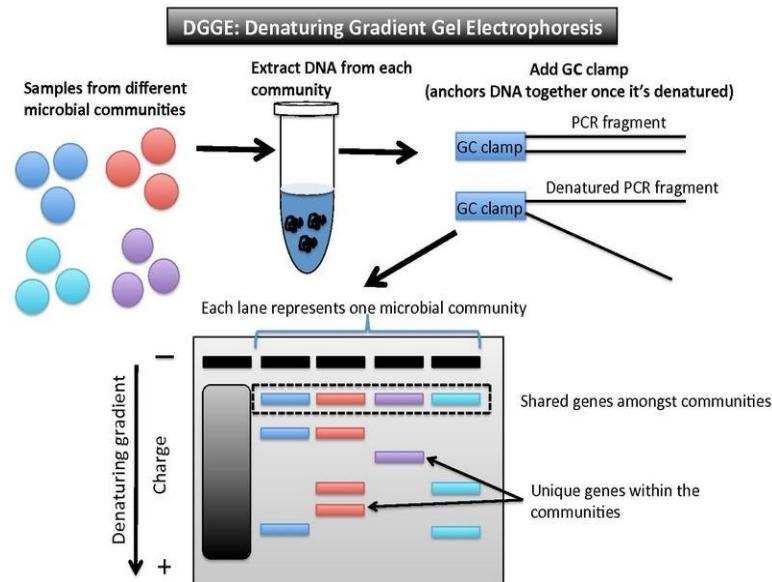

- Klonování amplikonů a sekvenování klonů
- Specifické elektroforézy - např. DGGE

Výhody paralelního sekvenování

- Cenově i časově míň nákladné
- Lépe se zachytí vzácné taxony (zlomky promile)

Ale:

- Riziko umělého navýšení diversity díky chybám při procesování dat
- Do jaké míry jsou referenční databáze dostatečné ke klasifikaci vzorků?
- Lze použít tato data kvantitativně a nebo vypovídají jen o přítomnosti/nepřítomnosti?

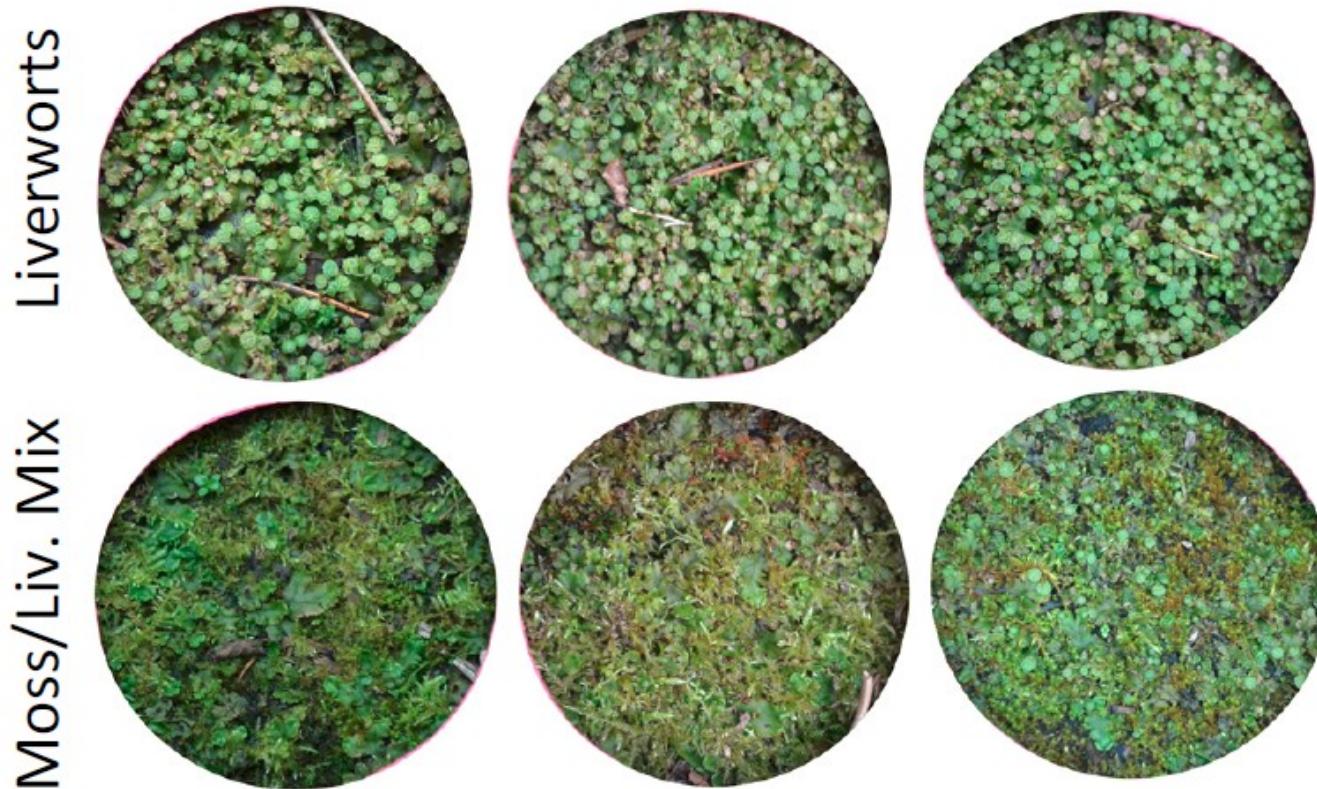

Metabarcoding – příklady využití

- Liverwort only vs. Mixed moss/liverwort (50:50)
- Collected at fixed distance from each other
- 3 replicates each

Společenstvo eukaryot ve vrchní vrstvě půdy

Metabarcoding - příklady využití

Společenstvo eukaryot ve vrchní vrstvě půdy

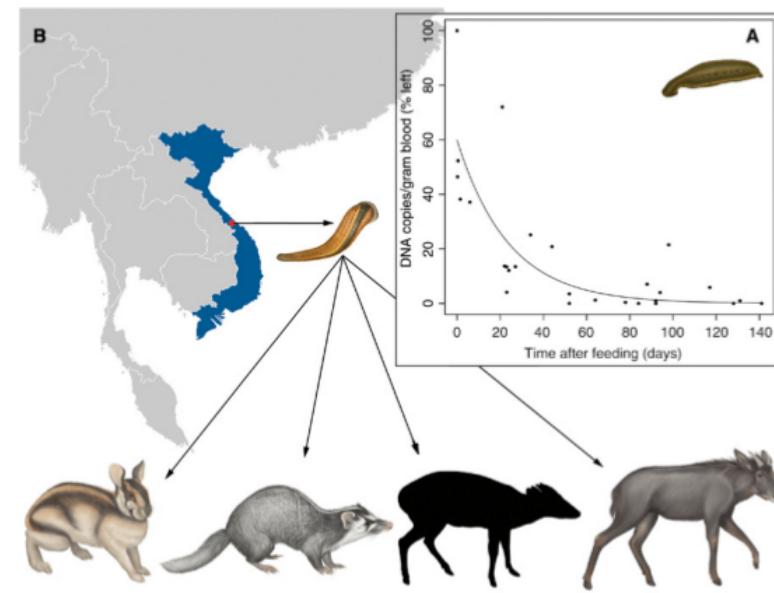

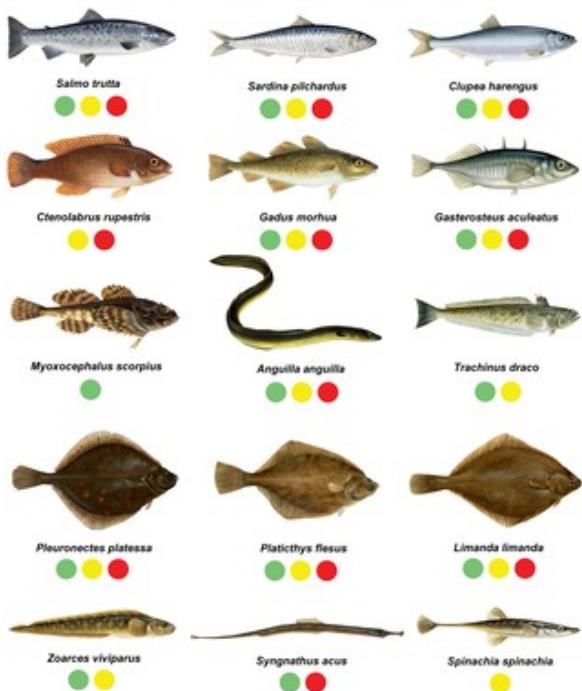

Figure 1. Monitoring mammals with leeches.

(A) Survival of mtDNA in goat blood ingested by *Hirudo medicinalis* over time, relative to freshly drawn sample (100%, ca. 2.4E+09 mtDNA copies/gram blood). Mitochondrial DNA remained detectable in all fed leeches, with a minimum observed level at 1.6E+04 mtDNA/gram blood ingested. The line shows a simple exponential decay model, $p < 0.001$, $R^2 = 0.43$ (Supplemental information). (B) Vietnamese field site location and examples of mammals identified in *Hæmadipsa* spp. leeches. From left to right: Annamite striped rabbit, small-toothed ferret-badger, Truong Son muntjac (coat coloration and markings remain unknown), serow. Pictures do not reflect true size proportions. Experts in Microsatellite Development

Microsatellites (also known as short tandem repeats) are repetitive DNA elements usually found in non-coding regions of the genome. They have high mutation rates, and therefore are frequently highly polymorphic. Variations in the number of repetitions generate different alleles. This makes them appropriate molecular markers for population genetics and molecular ecology projects.

We develop microsatellite markers for your study species

At AllGenetics, we use next-generation sequencing to obtain primer pairs which amplify polymorphic microsatellite loci in your study species. Genomic DNA is used to generate genomic libraries. We usually enrich these libraries with 4 to 6 different microsatellite motifs. However, we can customise the number of motifs to your needs. We obtain thousands of microsatellite-containing reads by using high-throughput sequencing. Our bioinformaticians analyse these reads for primer design. The primers obtained are multiplexed and tested for polymorphism in a number of individuals from different populations.

How we work

High quality DNA at a concentration of 100 ng/µL in a minimum volume of 50 µL from a number of individuals is required. Alternatively, we can isolate DNA from your samples. These samples should be adequately preserved to ensure DNA integrity. We will deliver tested primer pairs which amplify polymorphic loci for your study species. A detailed methodological report and all sequencing reads generated will also be provided.

Our microsatellite development projects are divided into four steps. For your convenience, we can carry out the entire project or only the parts you need.

RAD vs. ddRAD

A

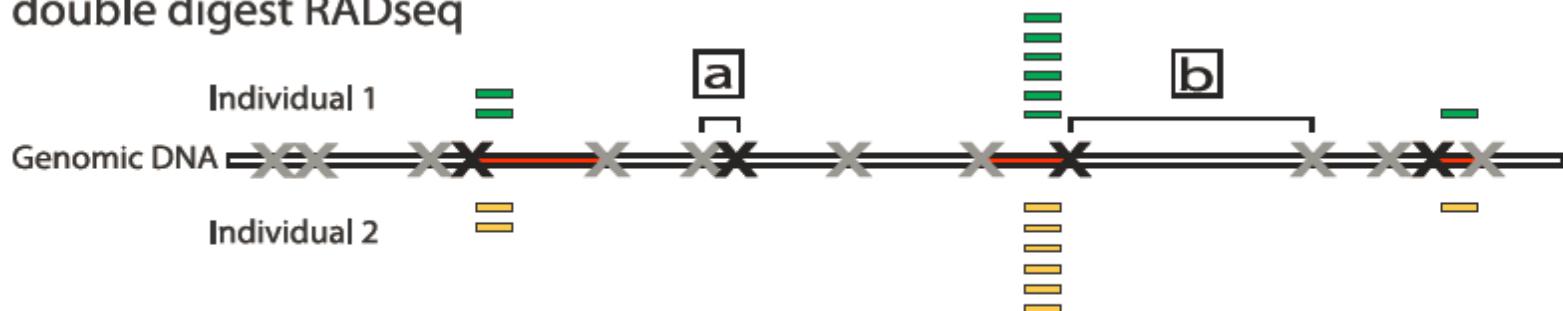

RAD sequencing

✗ Rare cut site
✗ Common cut site
— Genomic interval present in library
— Sequence reads

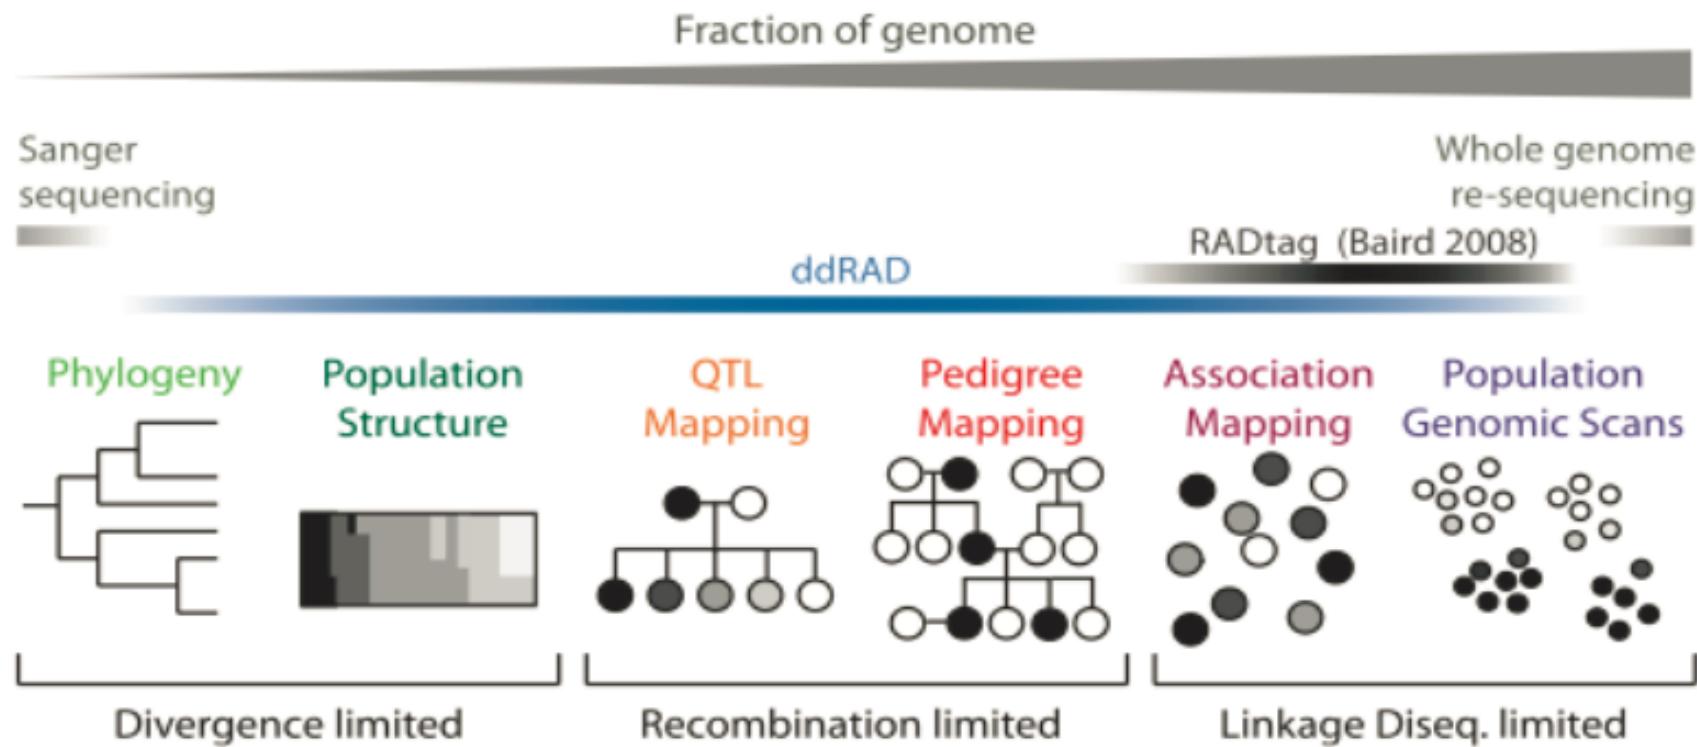

B

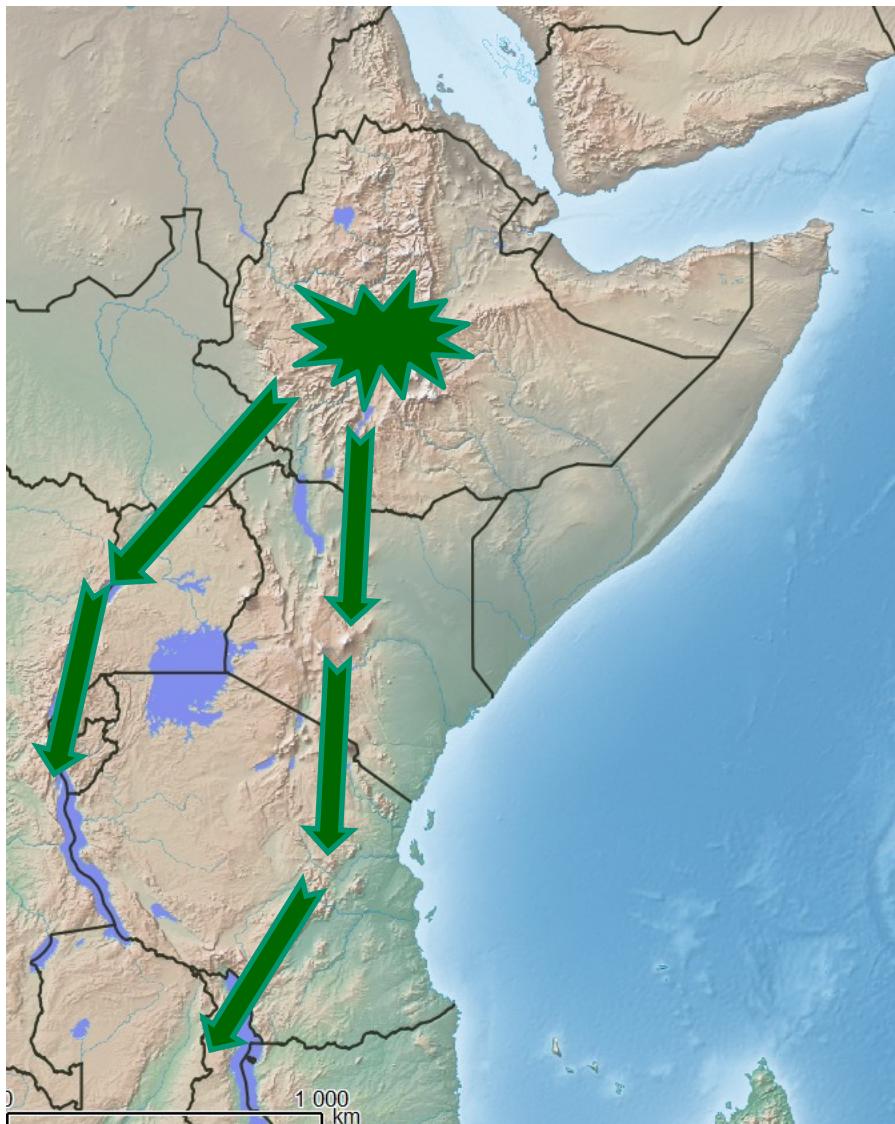

double digest RADseq

Sekvenování podél restrikčních míst

Phylogenomics of *Lophuromys*

- ancestral lineage „trapped“ in Ethiopian highlands, where diversified and sourced the colonization of other mountains (**mostly in Pleistocene**)
- *Lophuromys flavopunctatus* complex (9 Ethiopian species)

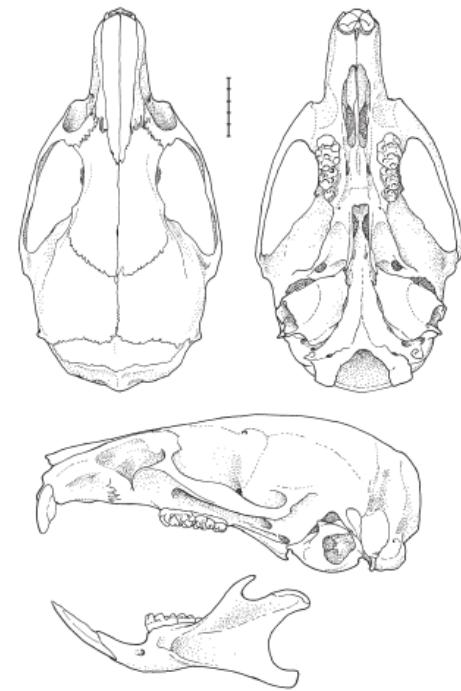

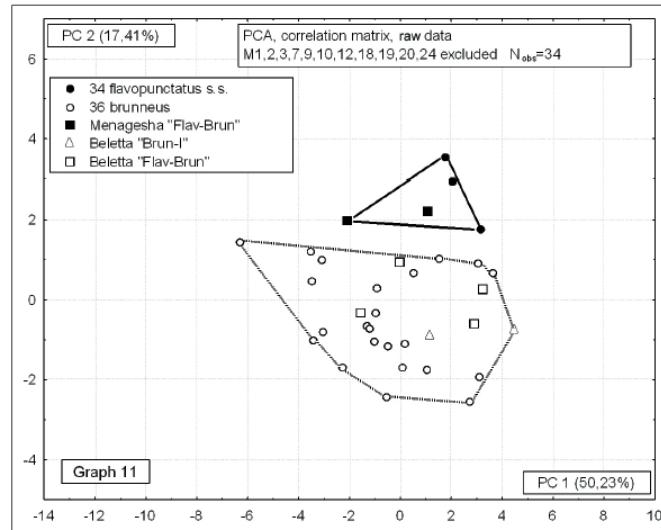

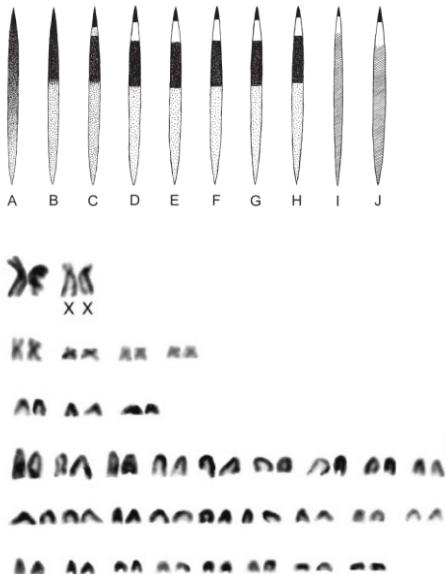

9 endemic species in Ethiopia

BULLETIN DE L'INSTITUT ROYAL DES SCIENCES NATURELLES DE BELGIQUE
BULLETIN VAN HET KONINKLIJK BELGISCH INSTITUUT VOOR NATUURWETENSCHAPPEN

BIOLOGIE, 77: 77-117, 2007
BIOLOGIE, 77: 77-117, 2007

Morphometric and genetic study of Ethiopian *Lophuromys flavopunctatus* THOMAS, 1888 species complex with description of three new 70-chromosomal species (Muridae, Rodentia)

by Leonid A. LAVRENCHENKO, Walter N. VERHEYEN, Erik VERHEYEN, Jan HULSELMANS & Herwig LEIRS

3.2. Views of skull and mandible of *Lophuromys menageshae* n.sp. (ZMMU S-165969, holotype). Scale bar = 5 mm.

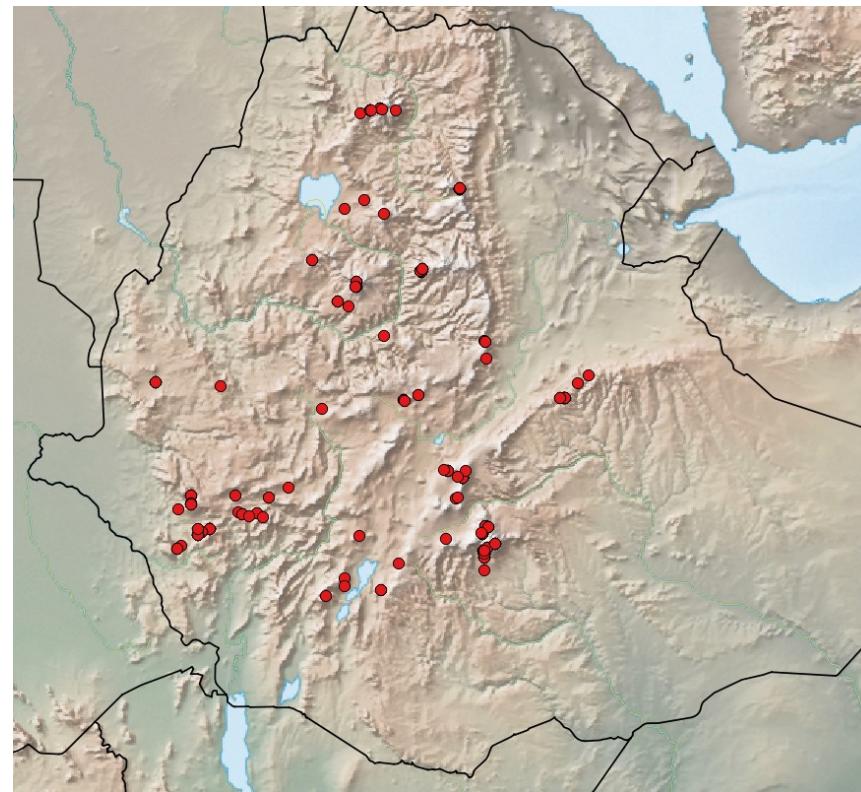

Lophuromys - questions

- Are there really 9 well delimited species?
- Are they easily (genetically) recognizable? (e.g. mtDNA-barcoding)
- What is their distribution and ecological requirements? -> IUCN assessment, etc.

Material and Methods

- cca 500 specimens from all major mountain ranges
- mtDNA marker (*CYTB*)
- 4 nuclear markers (2 introny + 2 exony)
- **genomic approach - ddRAD sequencing**
