

Organic synthesis

Kamil Paruch

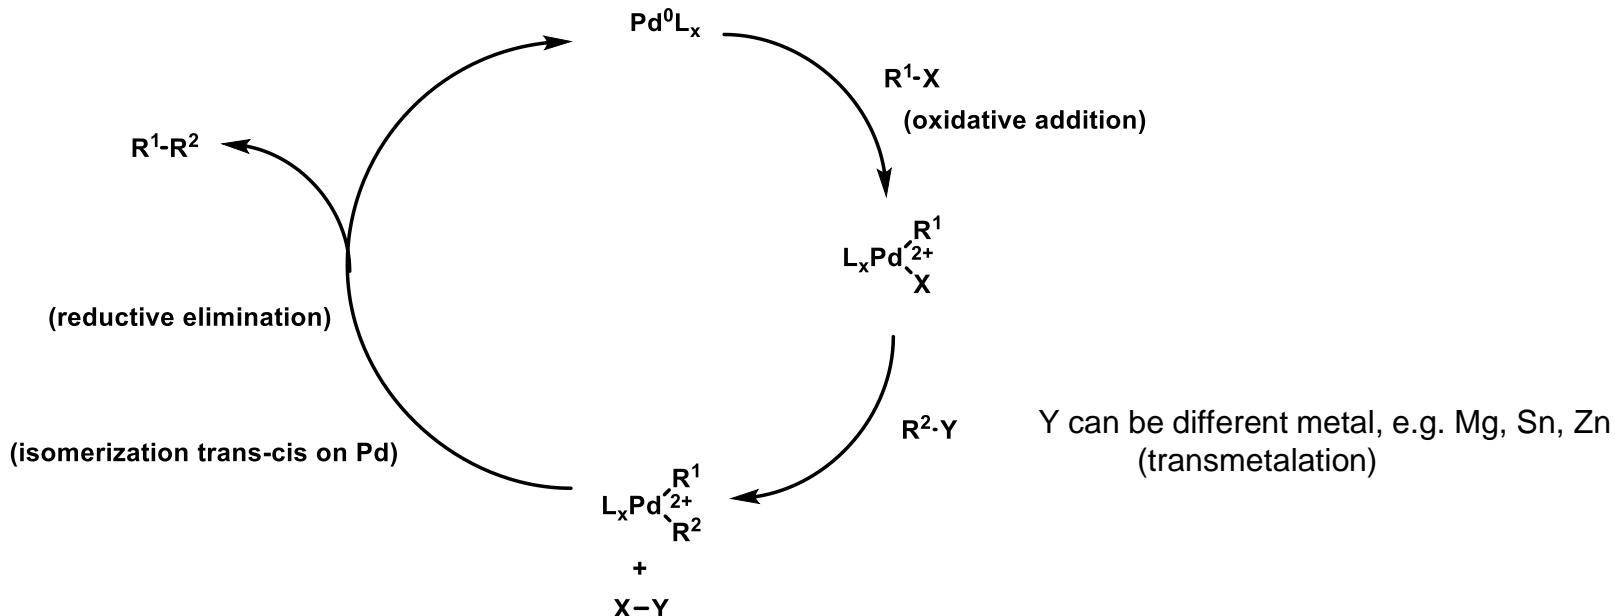

Masaryk University, Brno

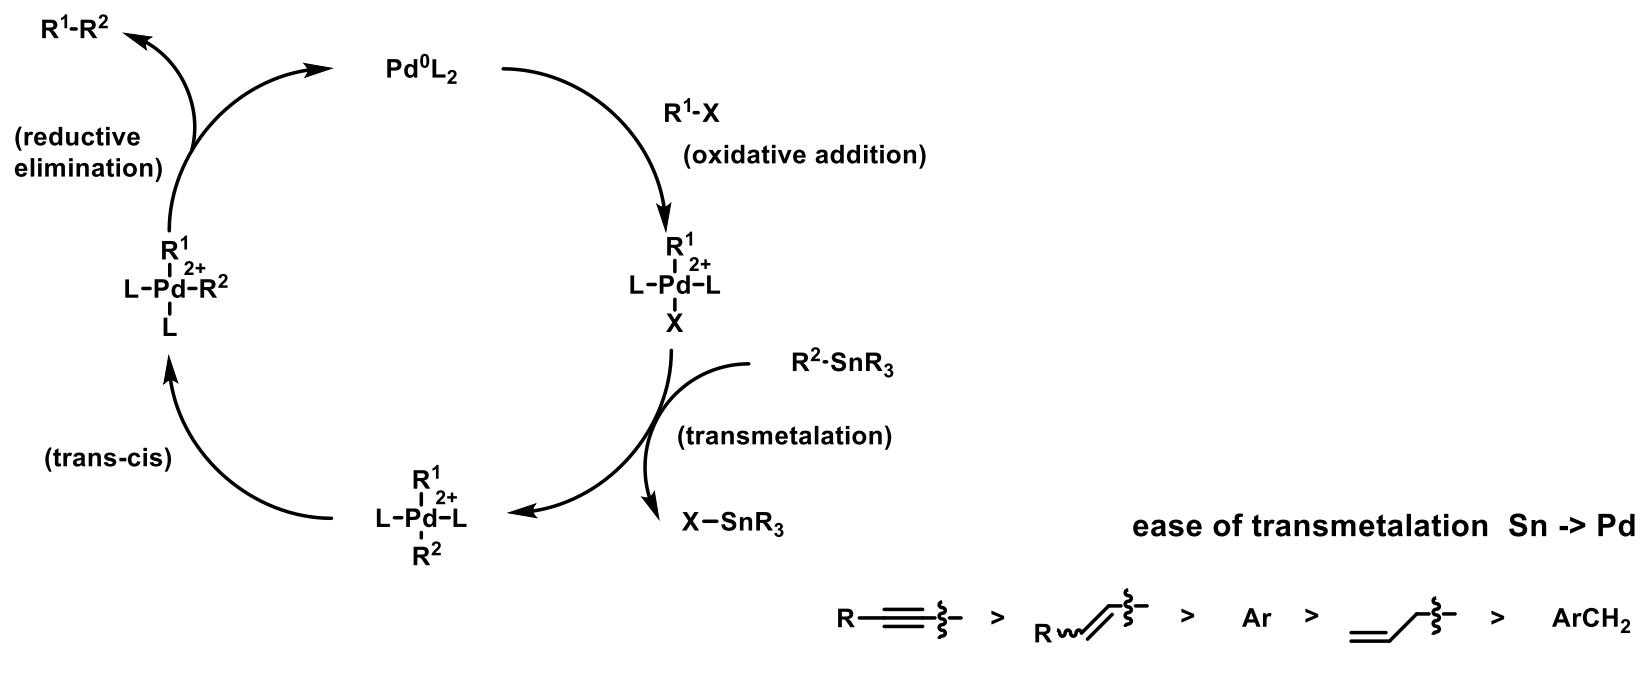

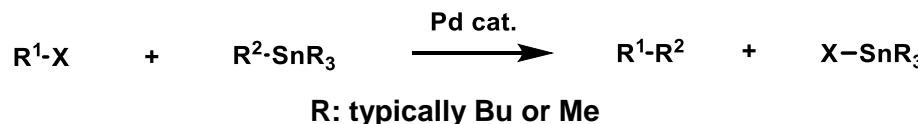

Reactions catalyzed by palladium

- formation of C-C, C-N, C-O bonds
- catalytic amount of Pd compounds
- mild reaction conditions; compatible with various functional groups

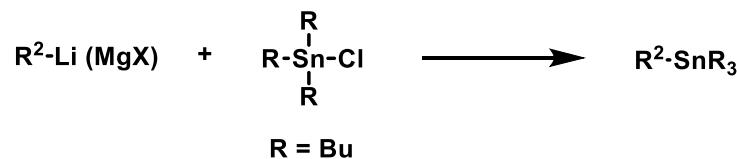

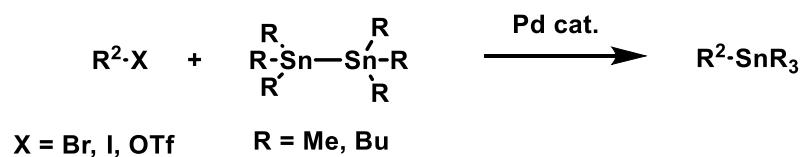

Pd⁰: electron-rich, nucleophilic

Stille reaction

stannanes: \$\$\$

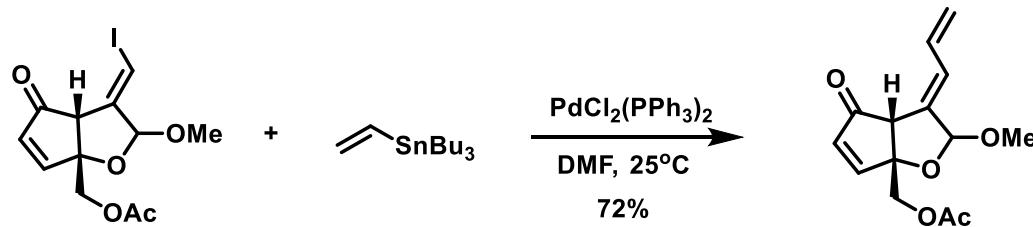

advantages: very mild conditions

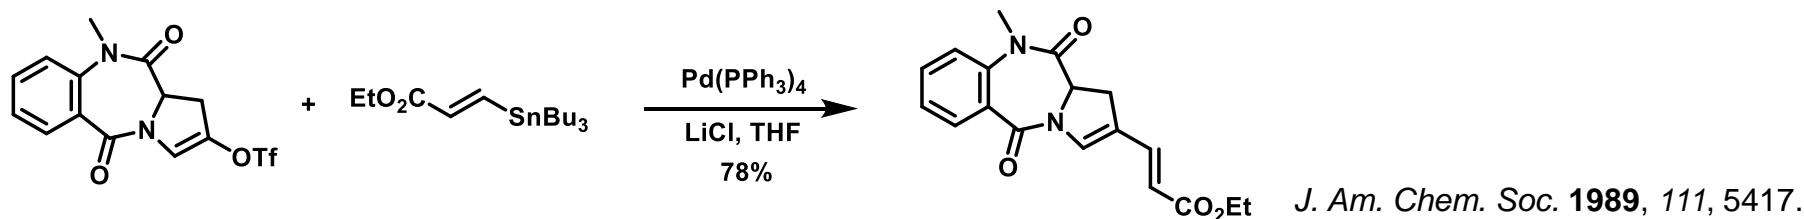

retention of configuration on double bond

triflates: possibility to generate kinetic vs thermodynamic OTf

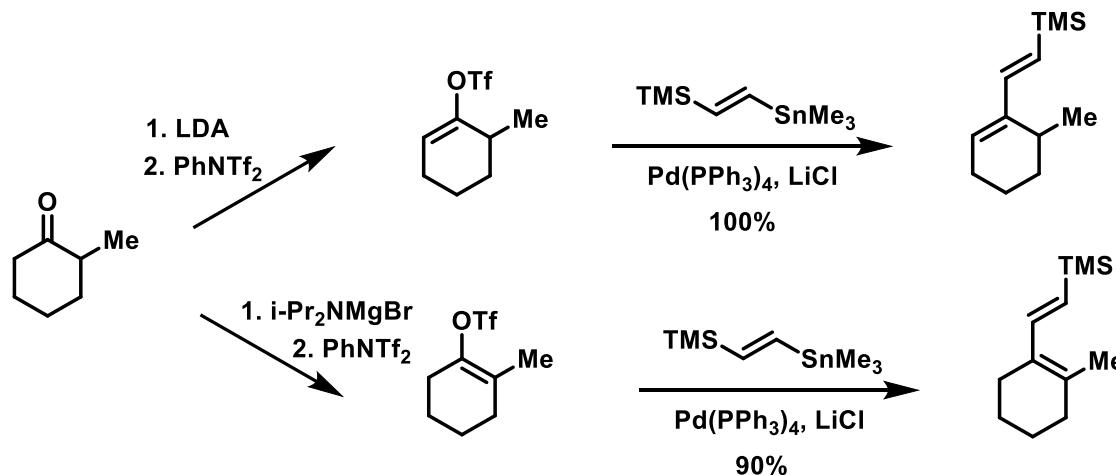

(also: can be made from ArOH)

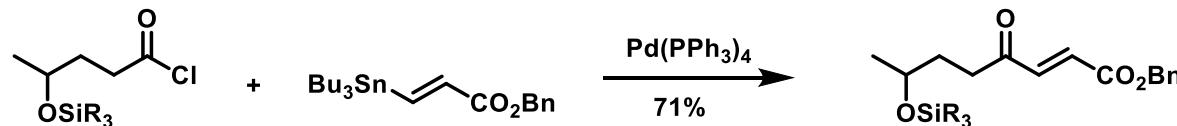

J. Am. Chem. Soc. **1988**, 110, 5911.

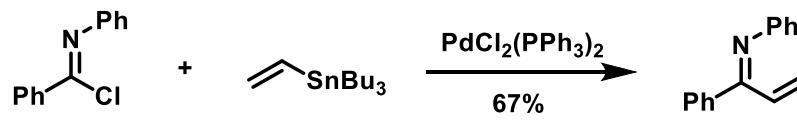

J. Am. Chem. Soc. **1989**, 111, 5417.

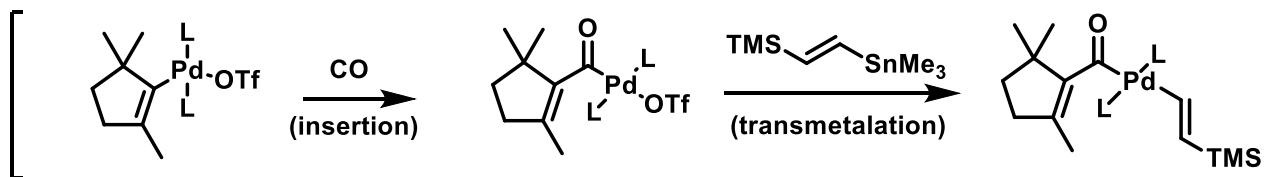

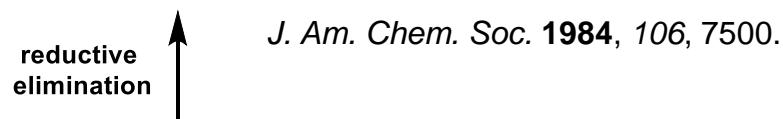

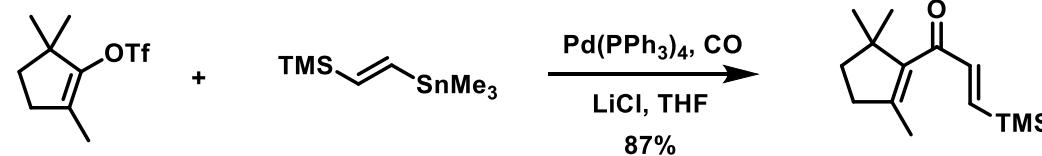

ketones from acid chlorides

*J. Org. Chem.* **1983**, *58*, 4634.

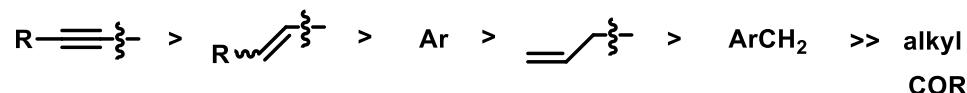

imines from imidoyl chlorides

*Bull. Chem. Soc. Jpn.* **1986**, *59*, 677.

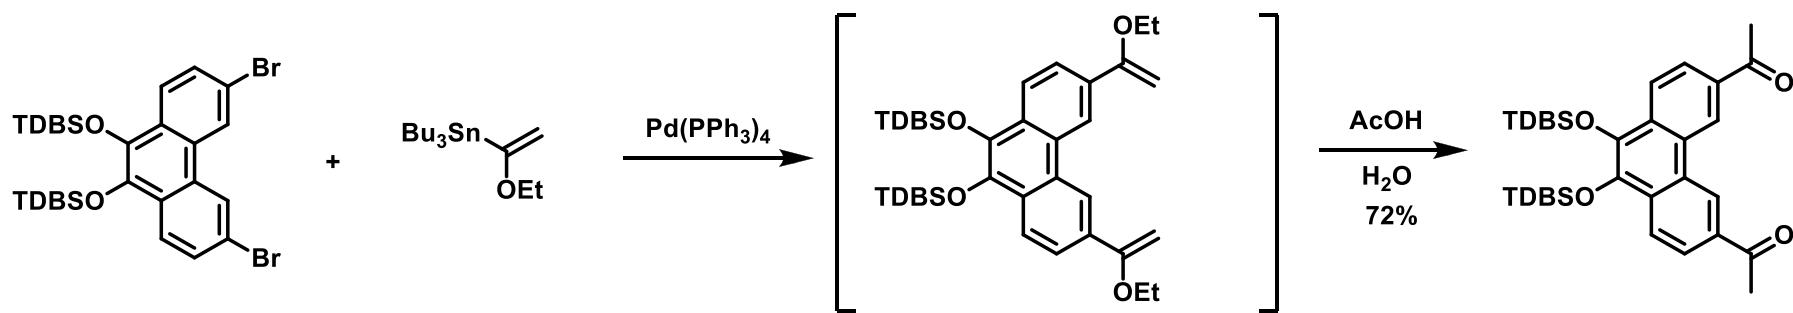

carbonylative Stille: insertion of CO

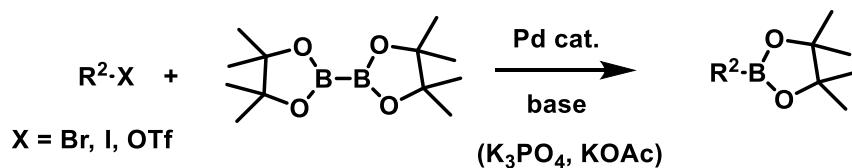

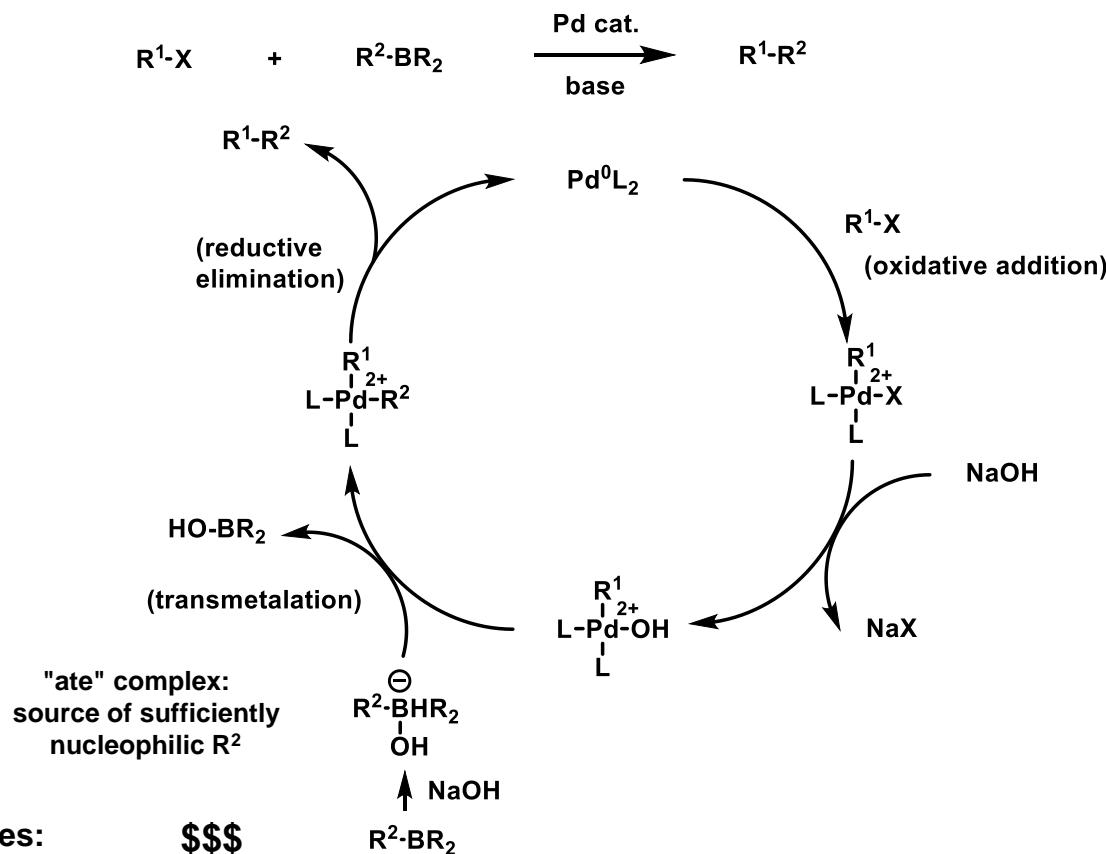

ease of transmetalation Sn->Pd

**stannylenol ethers**

- acyl equivalents

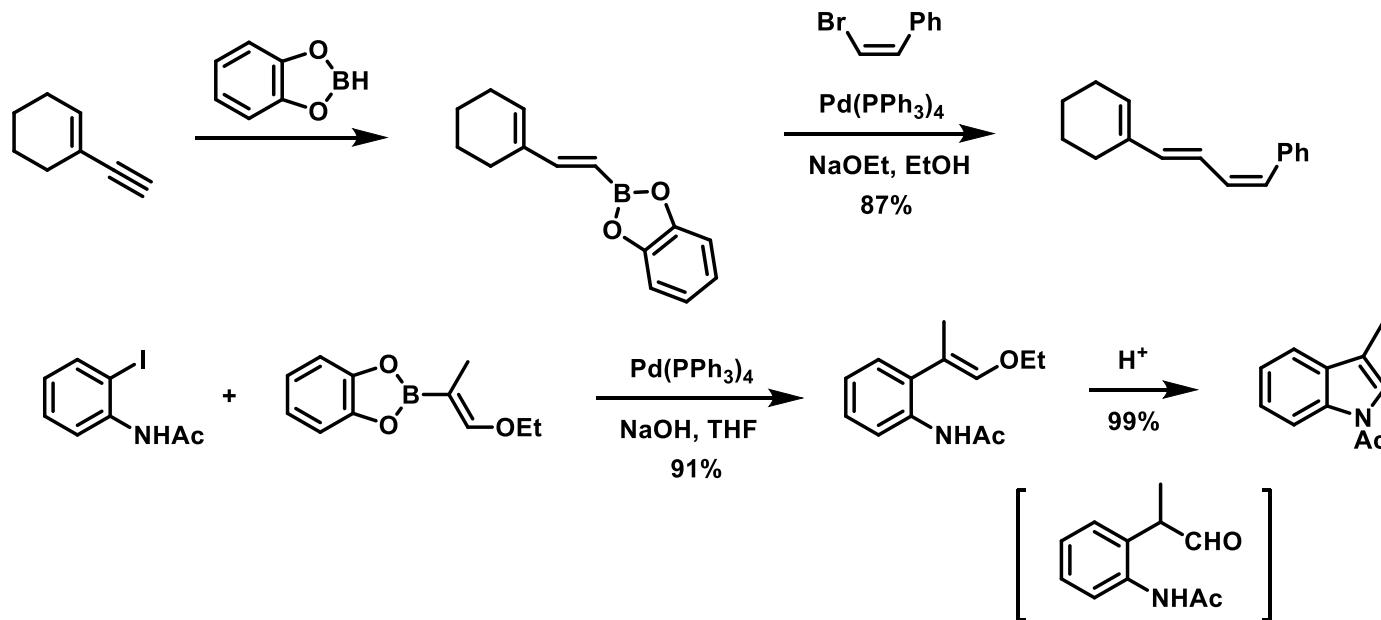

*J. Org. Chem.* **1998**, 63, 7456.

Suzuki reaction

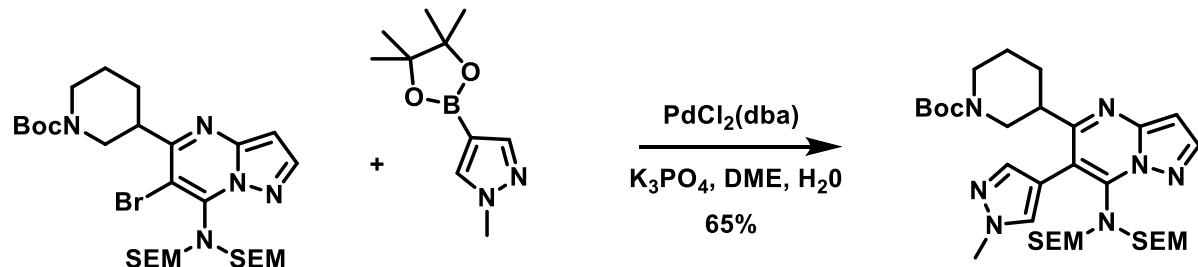

advantages: mild conditions (similar to Stille rxn)

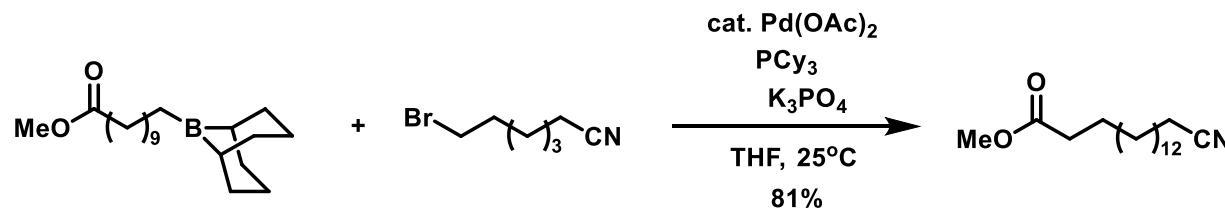

non-toxic side products

Suzuki coupling is often used for preparation of sterically hindered bis-(hetero)aryls

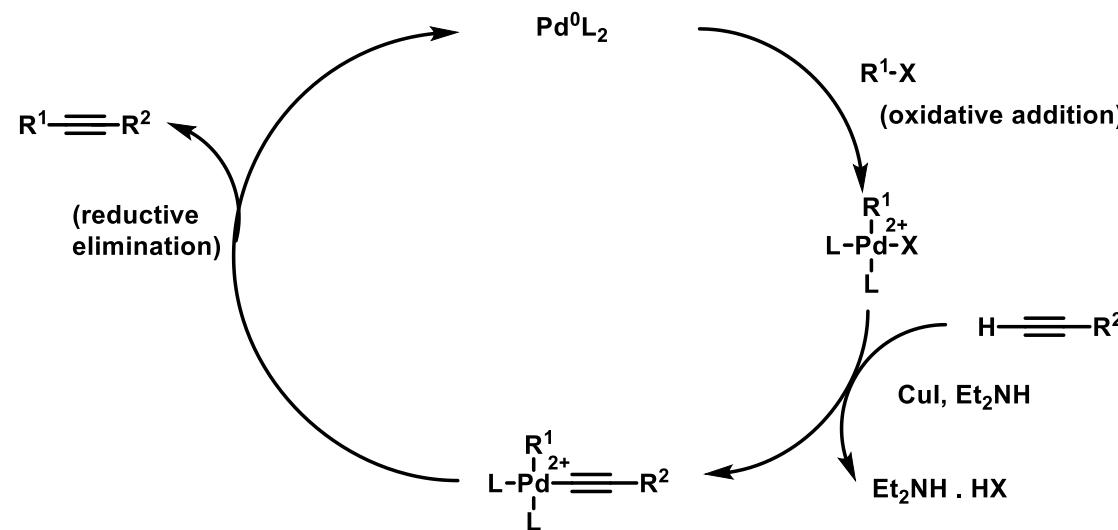

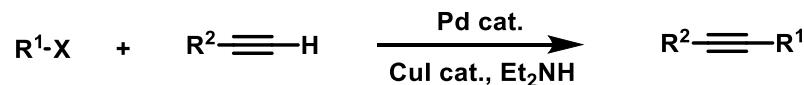

alkyl-alkyl Suzuki coupling

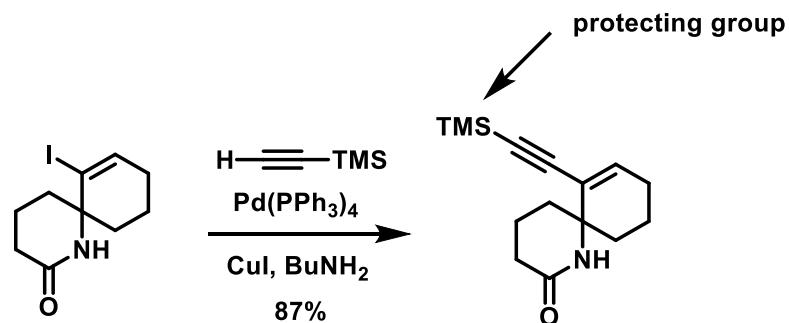

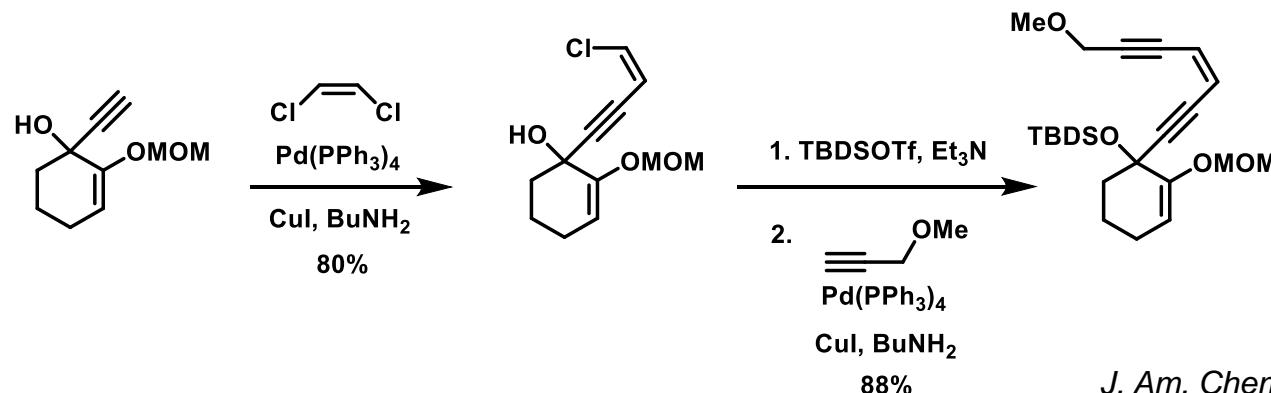

J. Am. Chem. Soc. **2001**, 123, 10099.

recent review: *Organic Reactions* **100**.

Sonogashira reaction

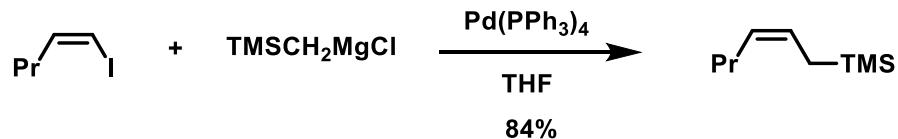

Sonogashira reaction

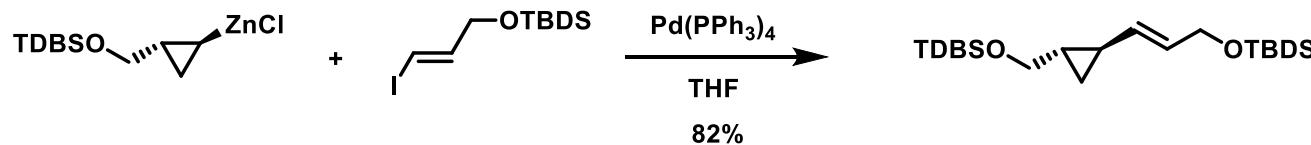

Tetrahedron Lett. **1988**, *29*, 2989.

- transmetalation from Mg (Kumada coupling) or Zn (Negishi coupling)

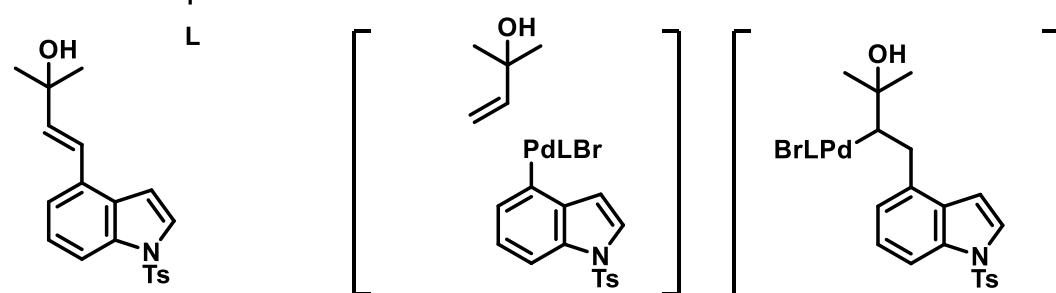

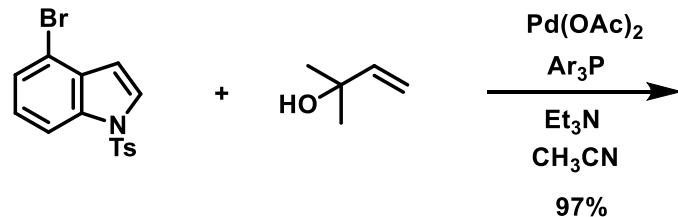

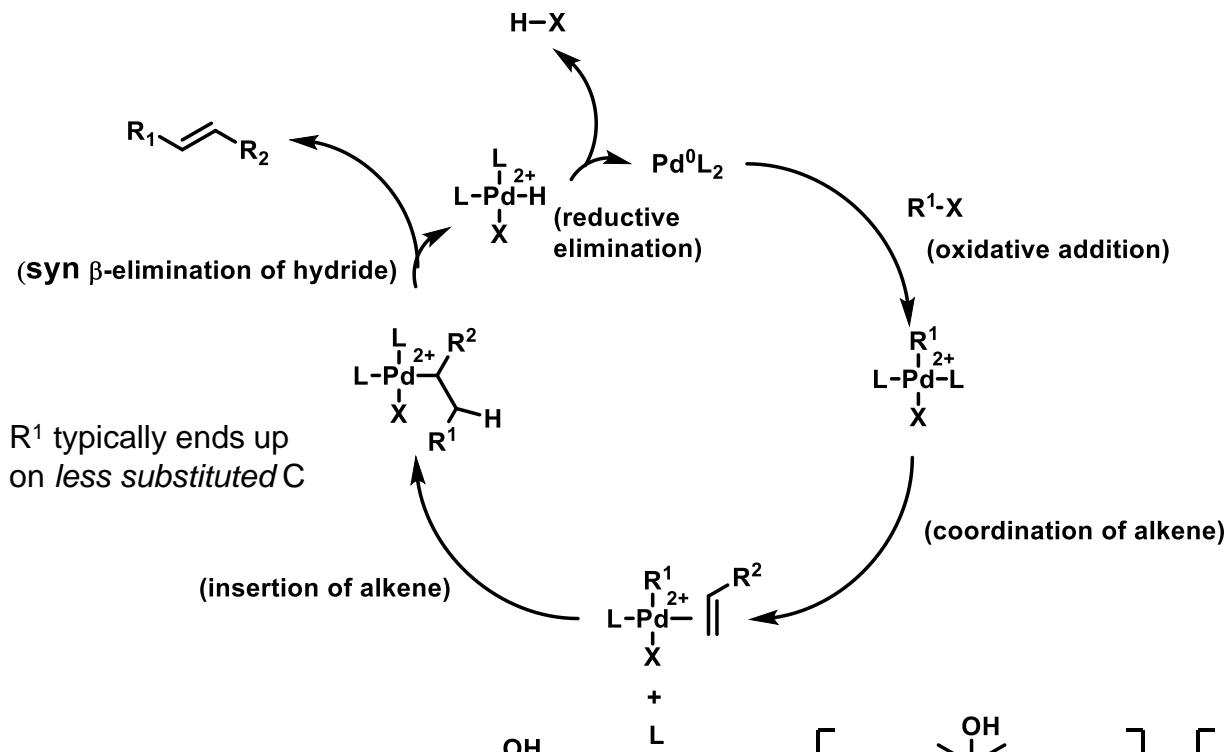

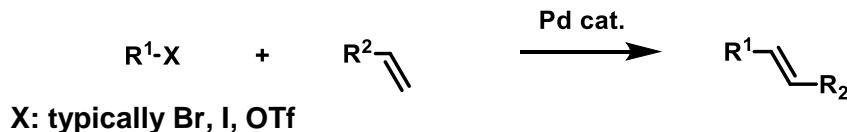

Tetrahedron Lett. **1982**, *23*, 27.

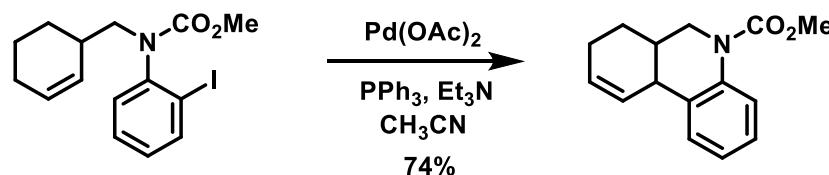

Tetrahedron Lett. **1987**, *28*, 5075.

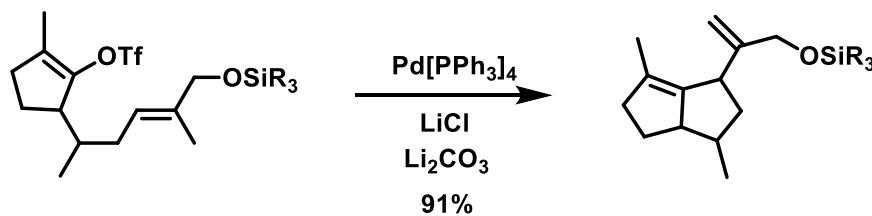

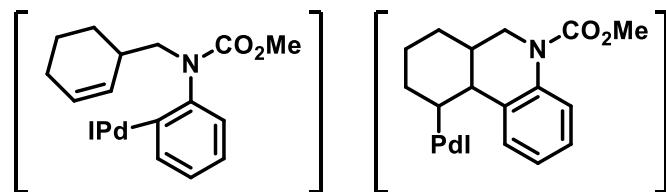

Heck reaction

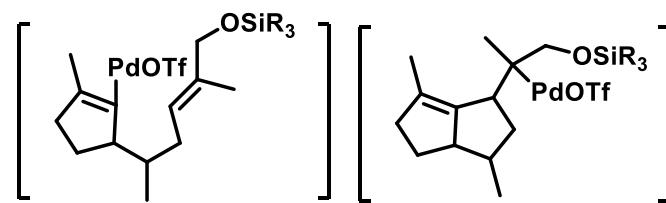

Heck reaction

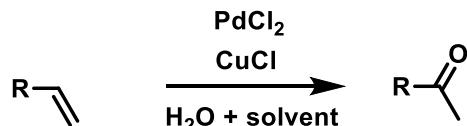

J. Org. Chem. **1987**, *52*, 4130.

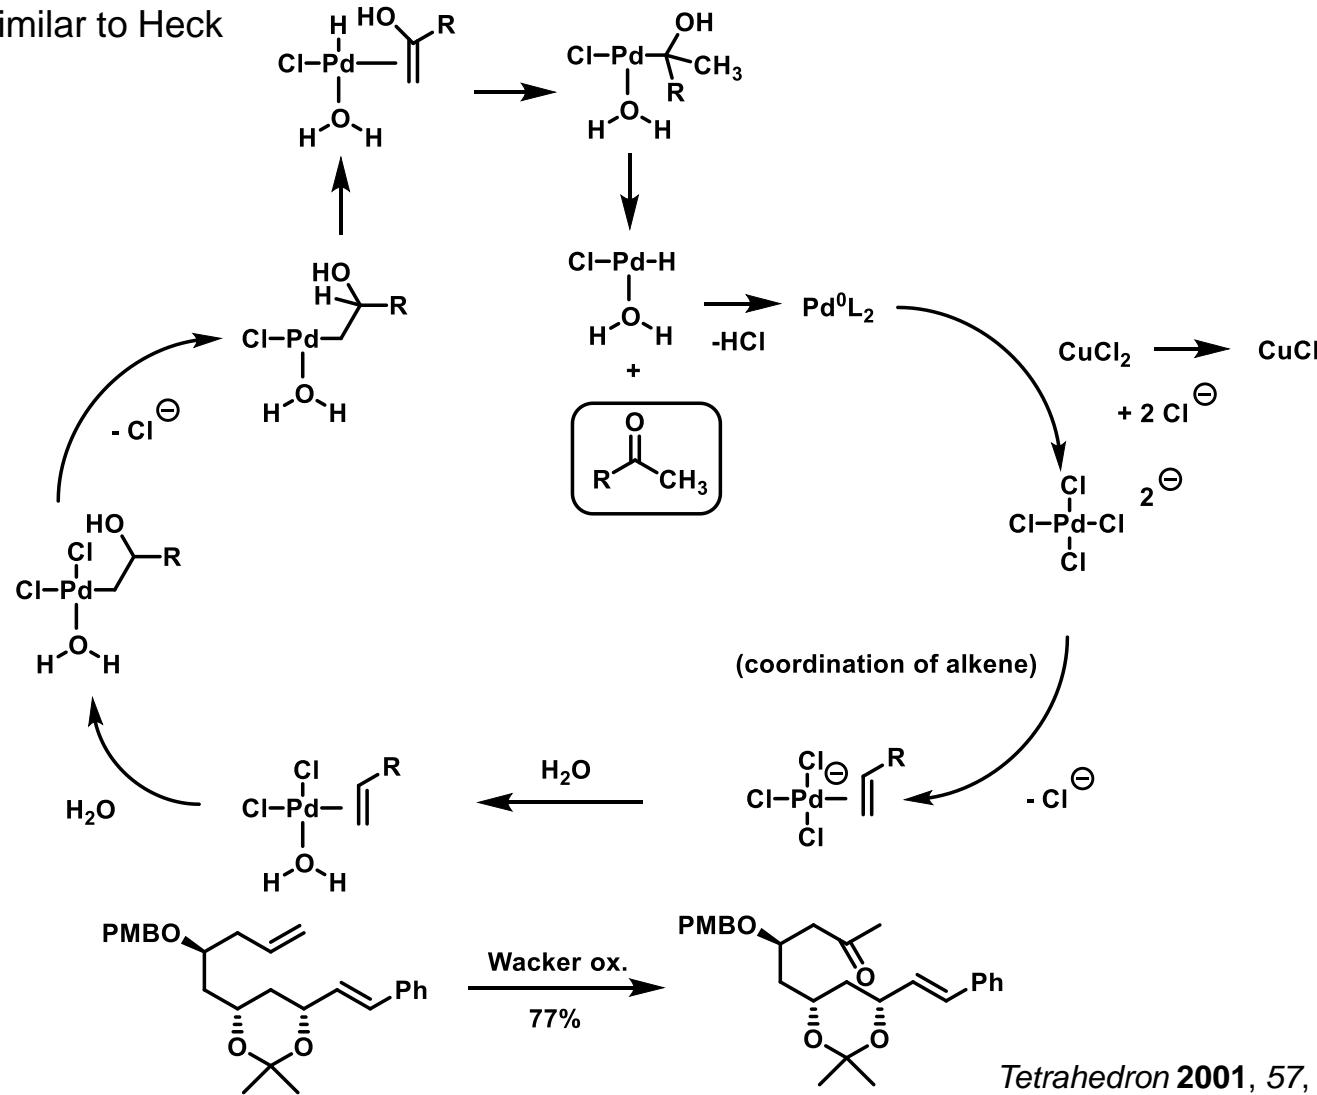

Acta Chem. Scand. **1992**, *46*, 597.

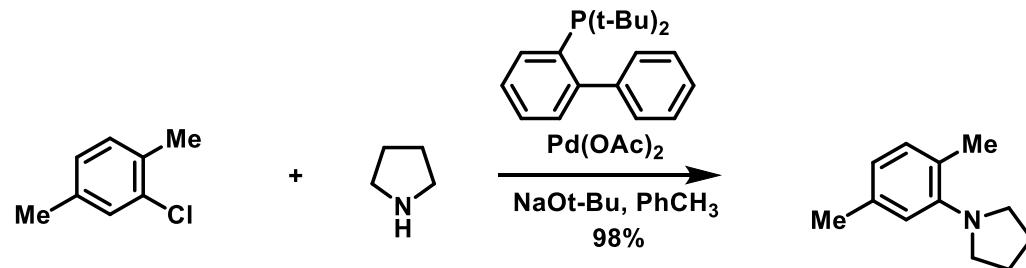

- mechanistically similar to Heck

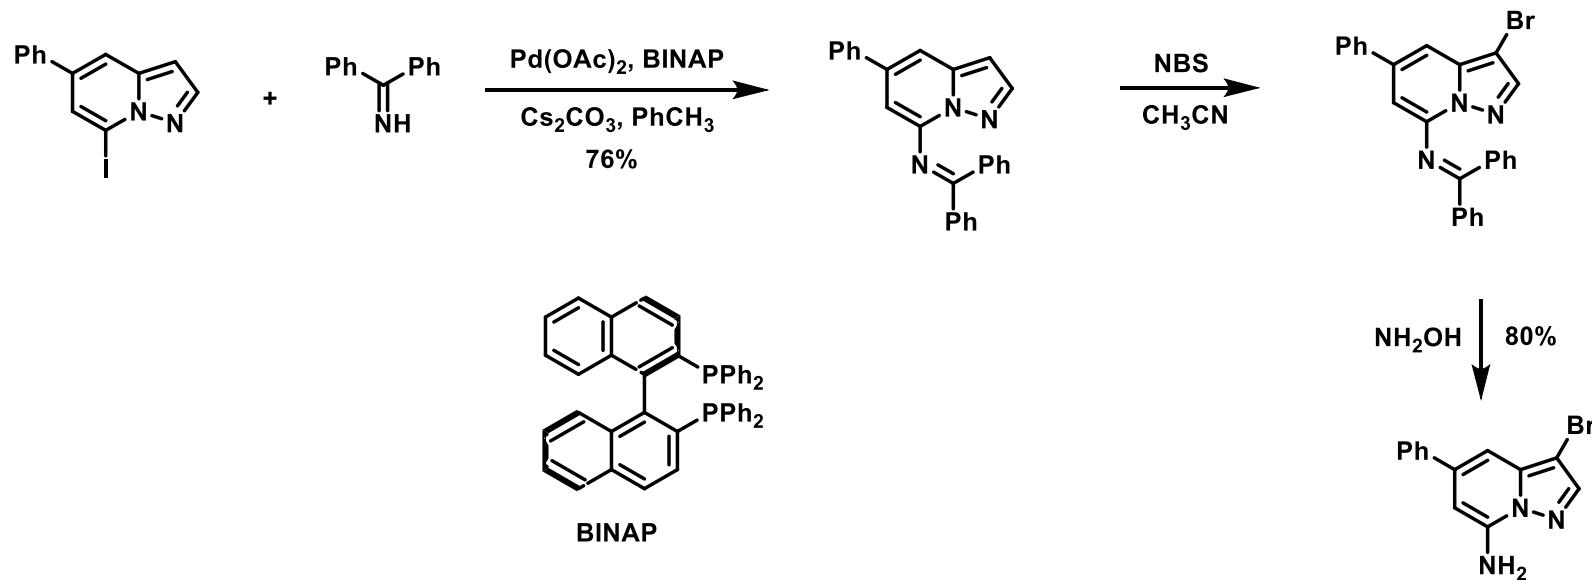

Buchwald-Hartwig amination

- typically: preparation of arylamines

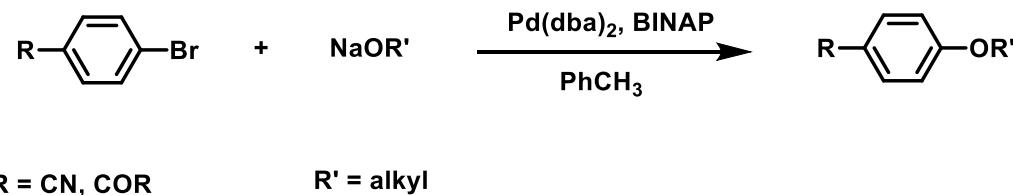

J. Org. Chem. **2000**, 65, 1158.

- ammonia equivalents: benzophenone imine; BocNH_2

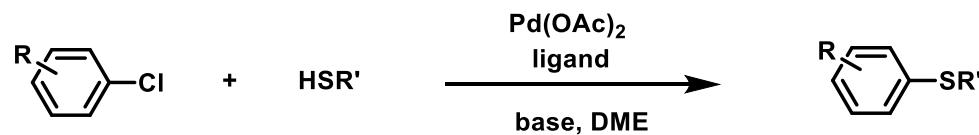

Bioorg. Med. Chem. Lett. **2007**, 17, 6216.

- historically somewhat less developed than amination

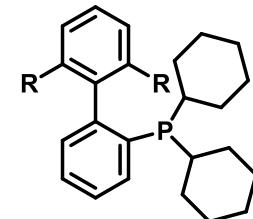

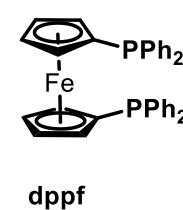

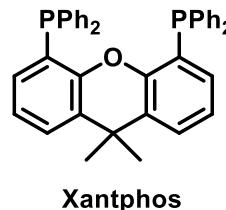

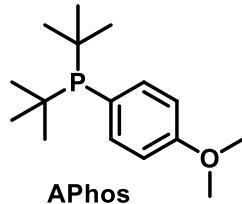

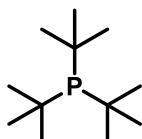

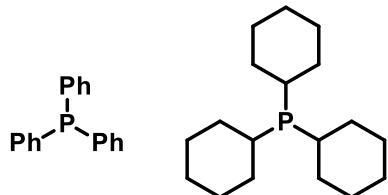

J. Am. Chem. Soc. **1996**, *118*, 13109.

- relatively recent technology

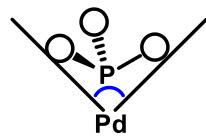

J. Am. Chem. Soc. **2006**, 128, 2180.

- the ligand(s) can have profound impact on the catalyst's activity
 - can be used in chemoselective couplings

cone angle: defined by outer edge of the substituents on P and the metal center

PH_3 : 87 °
 PMe_3 : 118 °
 PPh_3 : 145 °
 PCy_3 : 170 °
 $\text{P}(t\text{-Bu})_3$: 182 °
 $\text{P}(o\text{-tol})_3$: 194 °

bite angle: defined as L-Pd-L angle

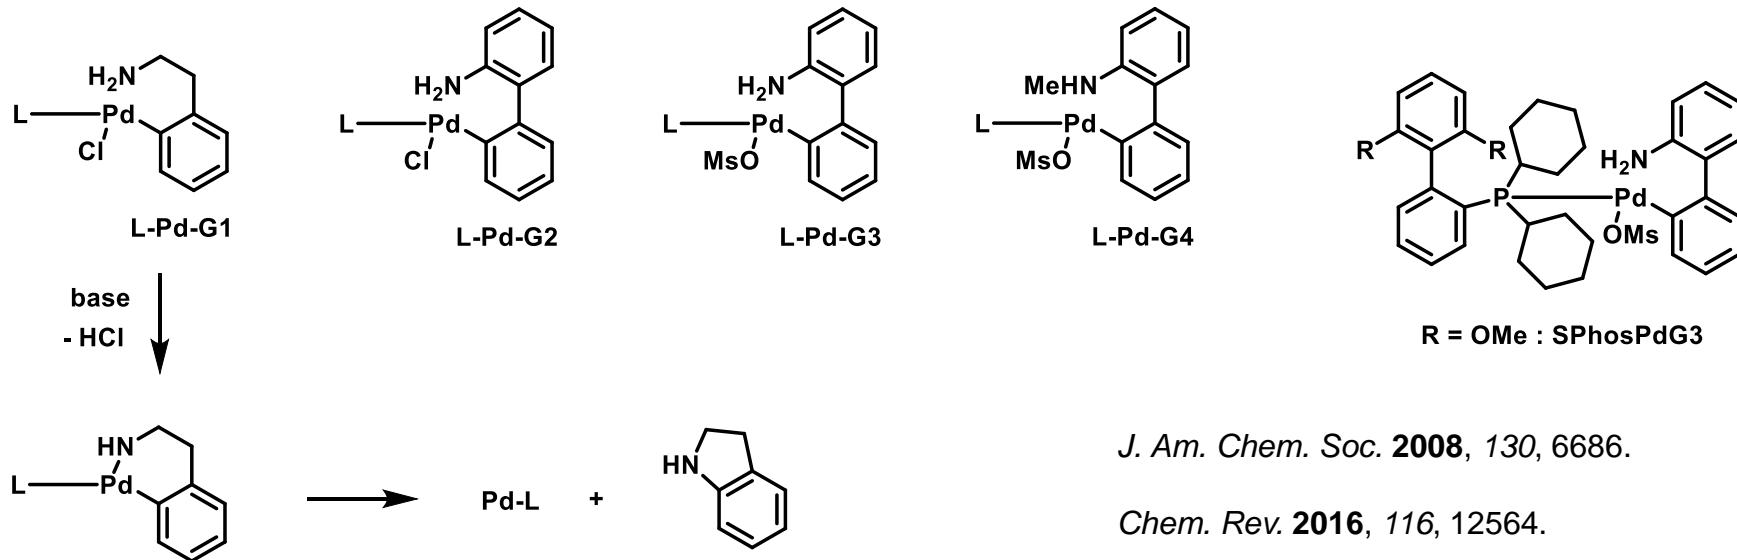

dppf: 99 °
 Xantphos: 107 °
 BINAP: 92 °

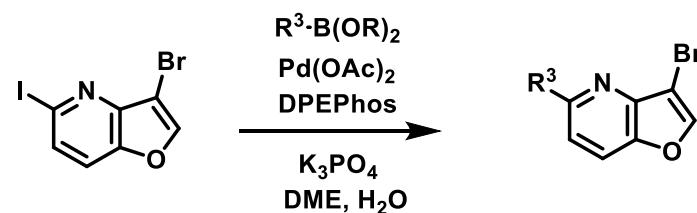

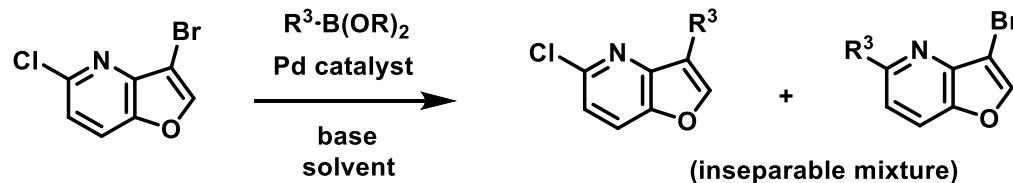

J. Chem. Soc. Dalton Trans. **1999**, 1519.

large bite angle -> faster reductive elimination
(the preferred geometry of the Pd(0) product is linear)

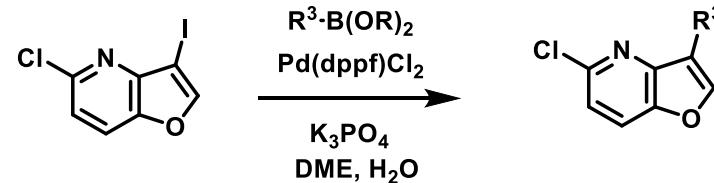

- base-activated palladacycles (precatalysts): air stable, form active catalysts in the presence of base

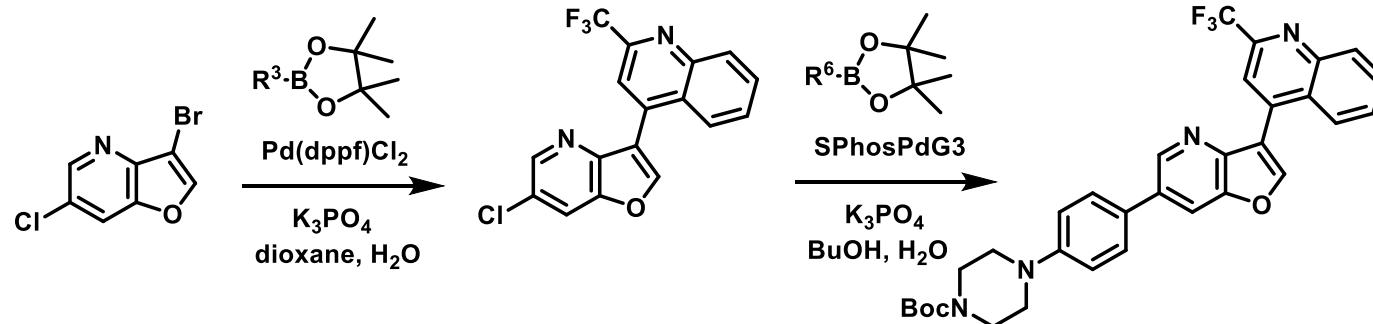

- the ligand(s) can have profound impact on the catalyst's activity
 - can be used in chemoselective couplings

Angew. Chem. Int. Ed. **2019**, 58, 1062.

Eur. J. Med. Chem. **2021**, 215, 113299.

- chemoselectivity?

VIP Palladium Trimer Catalysis Very Important Paper

C—I-Selective Cross-Coupling Enabled by a Cationic Palladium Trimer

Claudia J. Diehl, Thomas Scattolin, Ulli Englert, and Franziska Schoenebeck*

Abstract: While there is a growing interest in harnessing synergistic effects of more than one metal in catalysis, relatively little is known beyond bimetallic systems. This report describes the straightforward access to an air-stable Pd trimer and presents unambiguous reactivity data of its privileged capability to differentiate C—I over C—Br bonds in C—C bond formations (arylation and alkylation) of polyhalogenated arenes, which typical Pd^0 and Pd^I-Pd^I catalysts fail to deliver. Experimental and computational reactivity data, including the first location of a transition state for bond activation by the trimer, are presented, supporting direct trimer reactivity to be feasible.

While mononuclear catalysts have dominated the field of homogeneous catalysis in the past decades, there is a growing interest in harnessing the synergistic interplay of multi-metal catalysts to access novel reactivities and selectivities.^[1] However, with more than one metal in a catalyst, there is also an
