

Organic synthesis

Kamil Paruch

Masaryk University, Brno

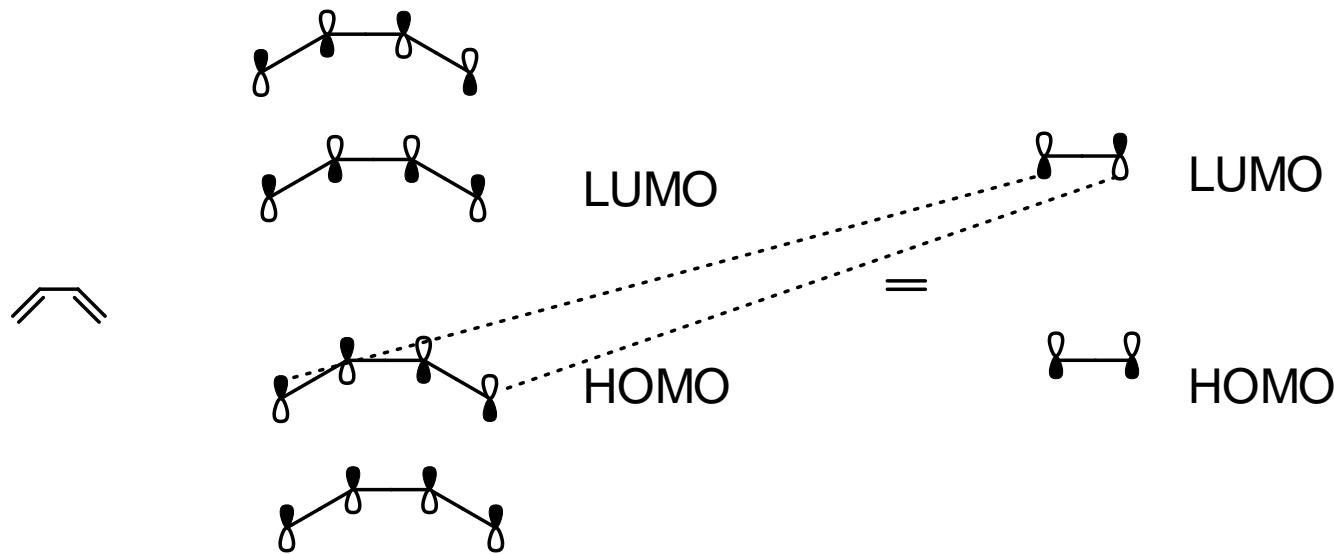

overall yield: 57%

Angew Chem. Int. Ed. **2009**, *48*, 1304..

- Highest Occupied Molecular Orbital (HOMO)
- Lowest Unoccupied Molecular Orbital (LUMO)
- bonding interactions: overlap of MO parts with the same sign of the wave function

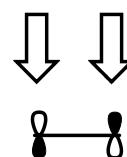

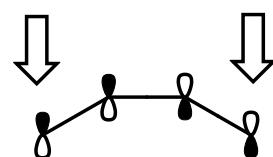

Woodward-Hoffmann rules

- describe the course of pericyclic reactions, based on the symmetry of molecular orbitals

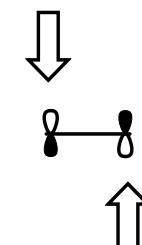

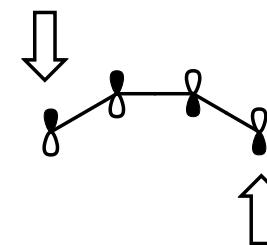

suprafacial interactions:

same side of the π system

antarafacial interactions:

opposite sides of the π system

allowed reactions: *thermal*: number of components $(4m+2)_s + (4n)_a$: odd number

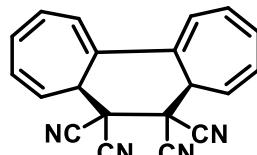

photochemical: number of components $(4m+2)_s + (4n)_a$: even number

Diels-Alder reaction: $(4\pi+2\pi)_s + (0)_a : 1$

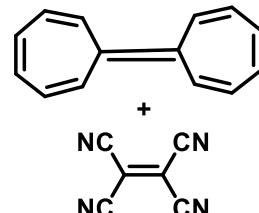

(6): $4m+2$

?

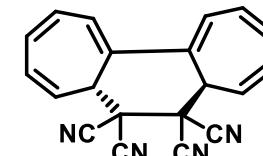

thermal reaction:

$(14\pi+2\pi)_s + (0)_a : 0$
(16): $4m$

→

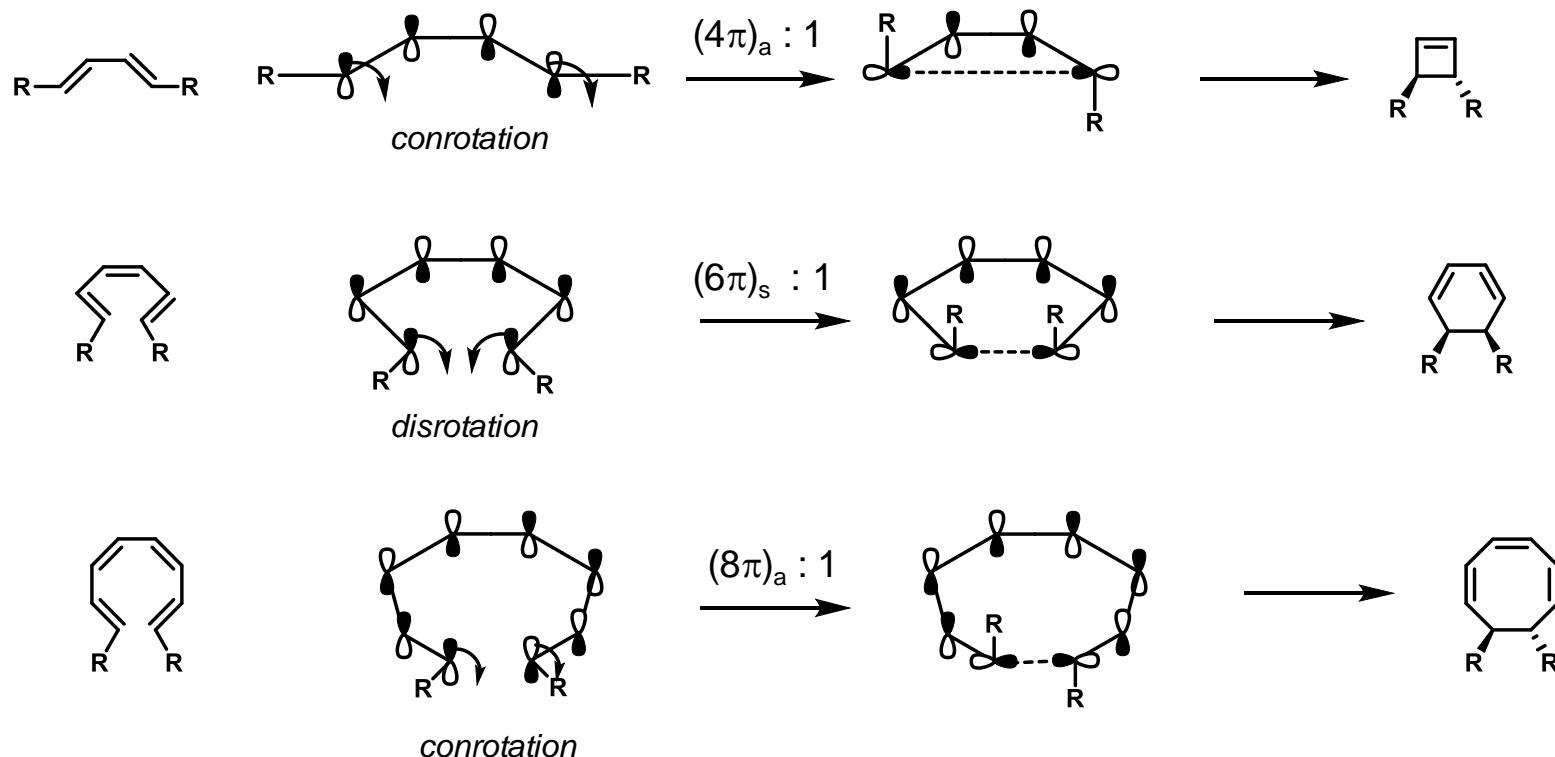

$(14\pi+0\pi)_s + (2\pi)_a : 1$
(14): $4m+2$

Electrocyclic reactions

- pericyclic closure and opening of rings

thermal: HOMO (corresponds to double bonds in the structure)

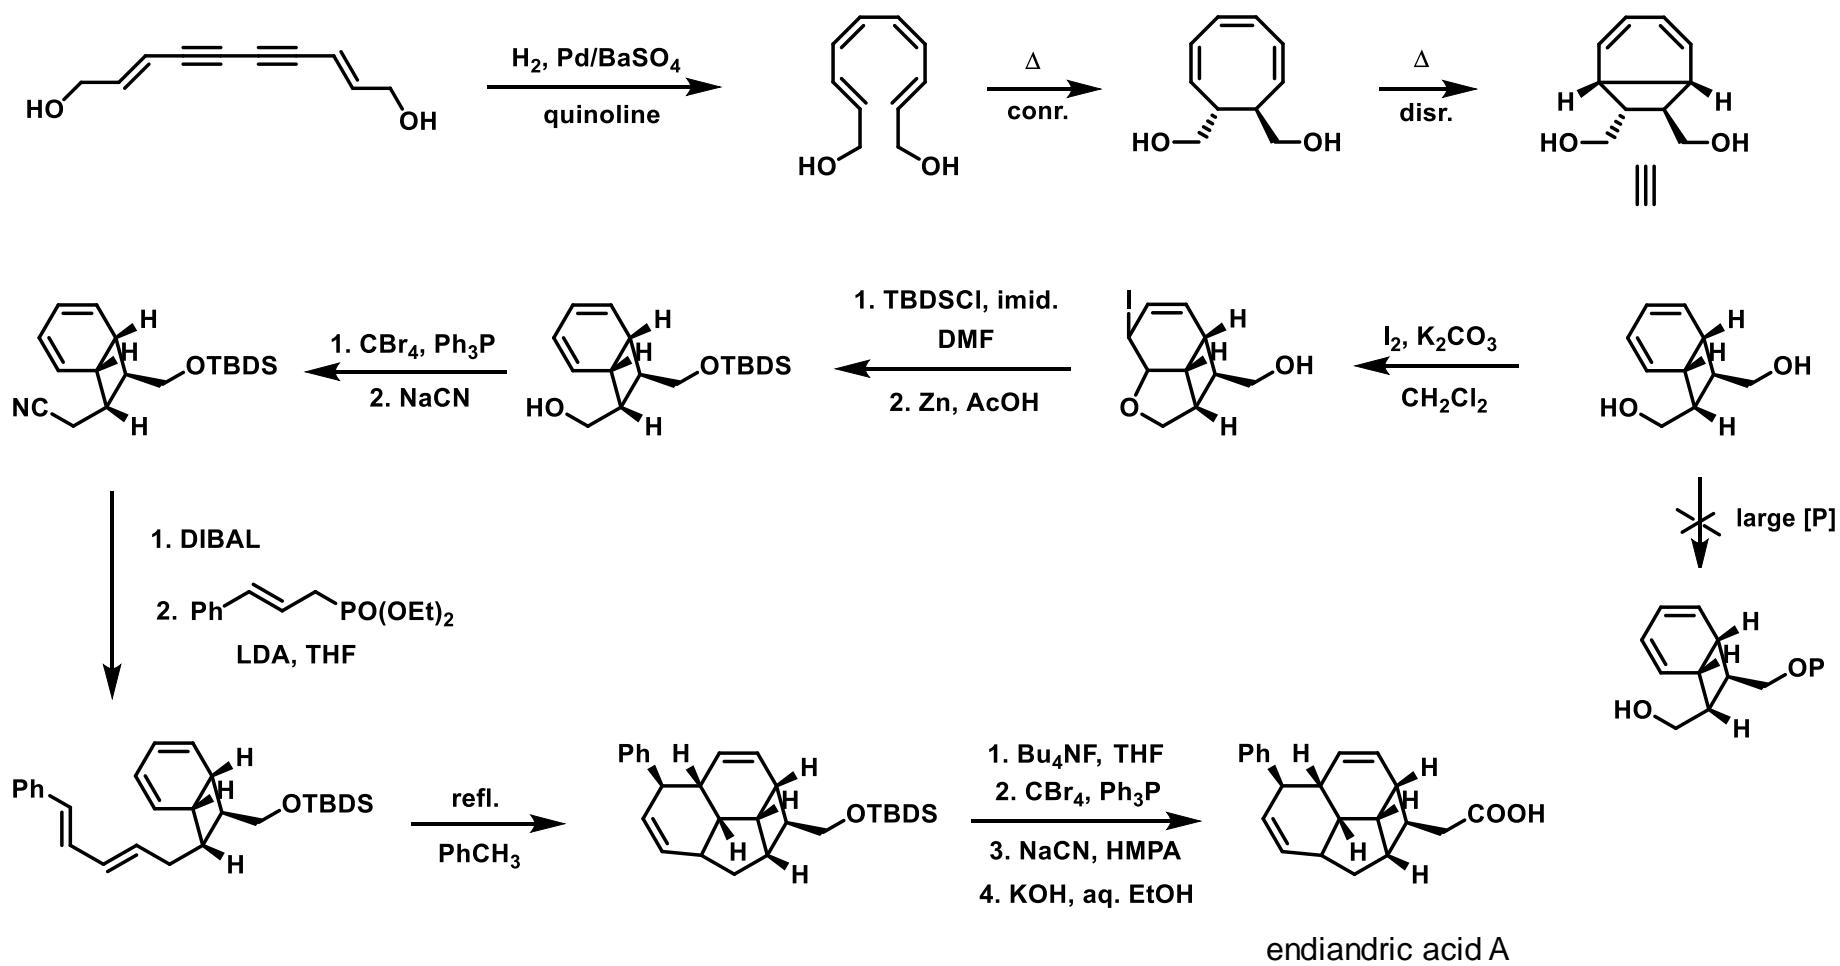

photochemical:

4π
disrotation

6π
conrotation

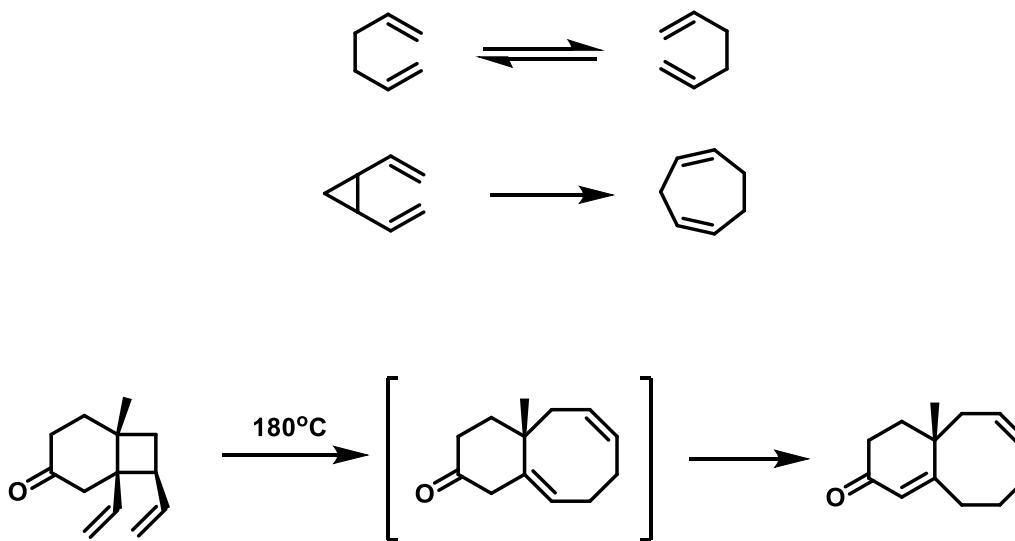

8π
disrotation

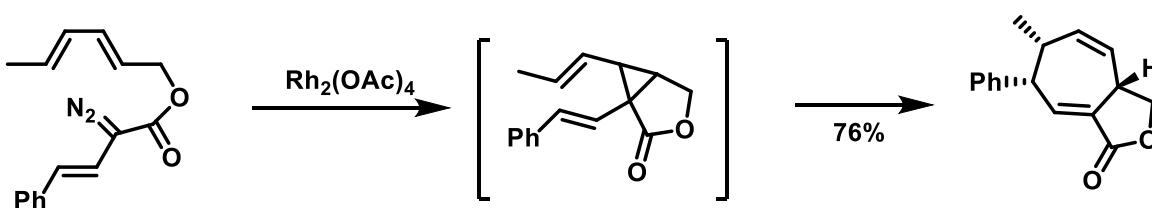

J. Am. Chem. Soc. **1982**, 104, 5560.

Cope rearrangement

- equilibrium reaction
- in some cases, the equilibrium is significantly shifted to the more stable isomer
(or the isomer that is converted to more stable product)

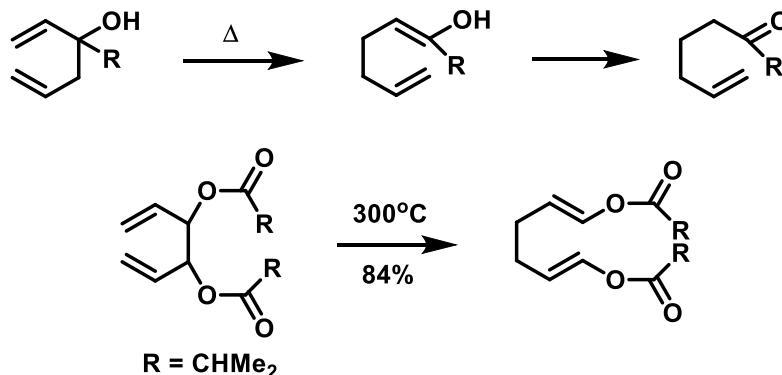

Tetrahedron Lett. **1988**, *29*, 2773.

J. Org. Chem. **1989**, *54*, 930.

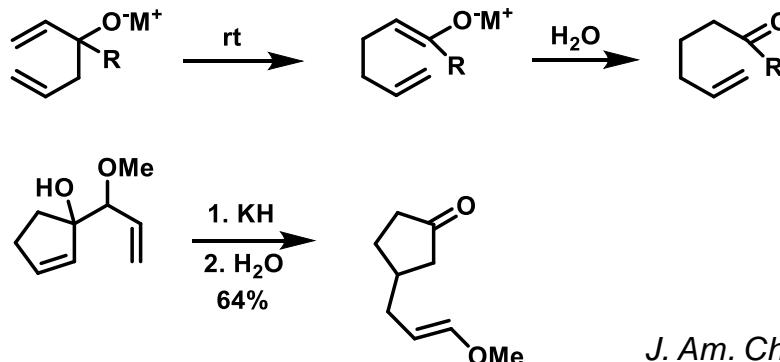

oxy-Cope rearrangement

- newly formed enol tautomerizes to ketone (irreversible process)

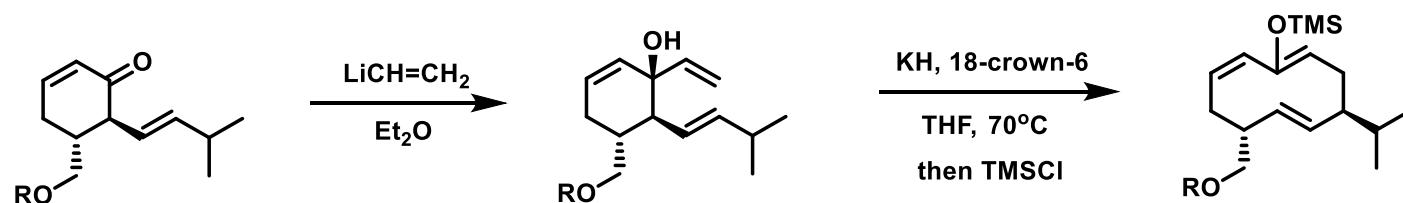

anionic oxy-Cope rearrangement

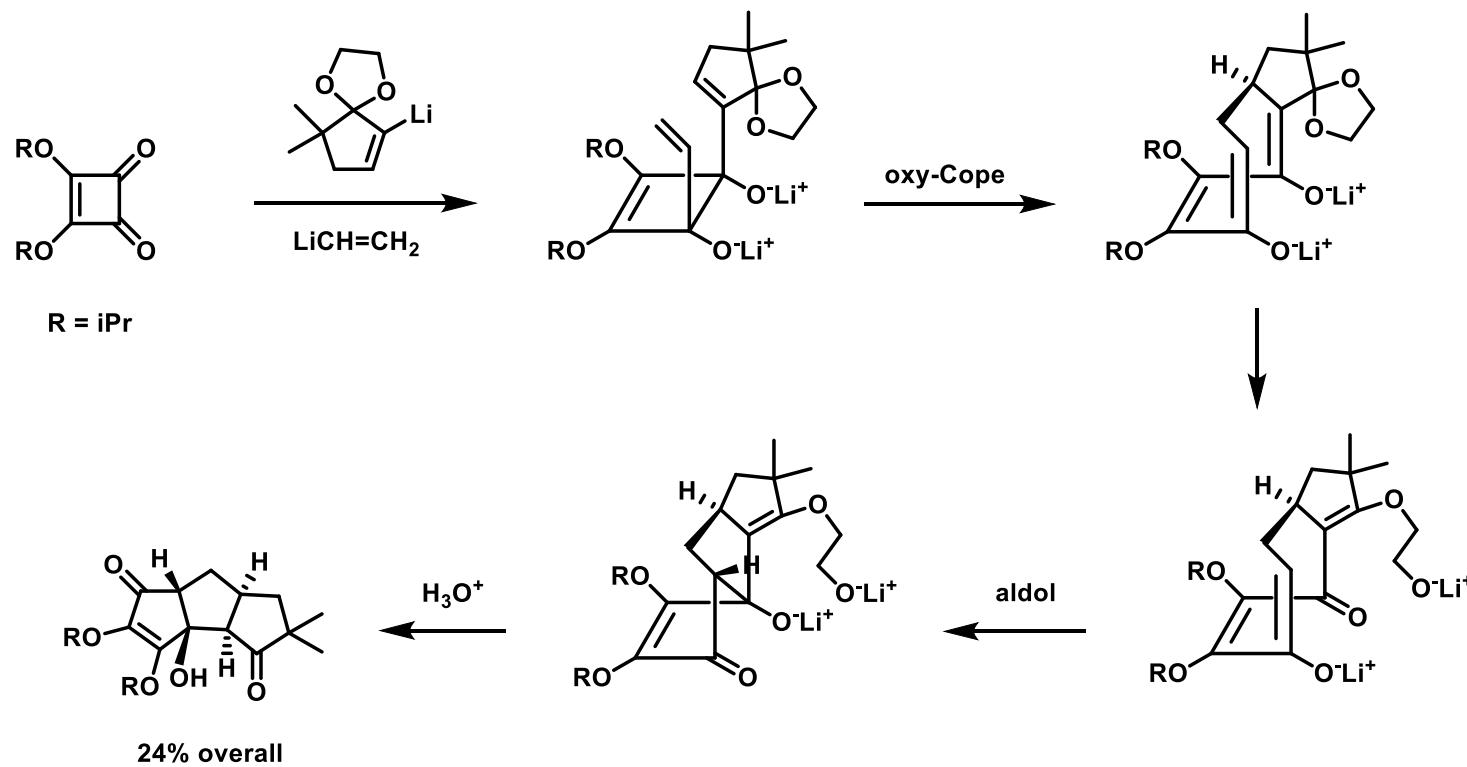

- substrate: 1,5-diene alkoxide
- fast reactions, often at 25°C

J. Am. Chem. Soc. **1980**, *102*, 774.

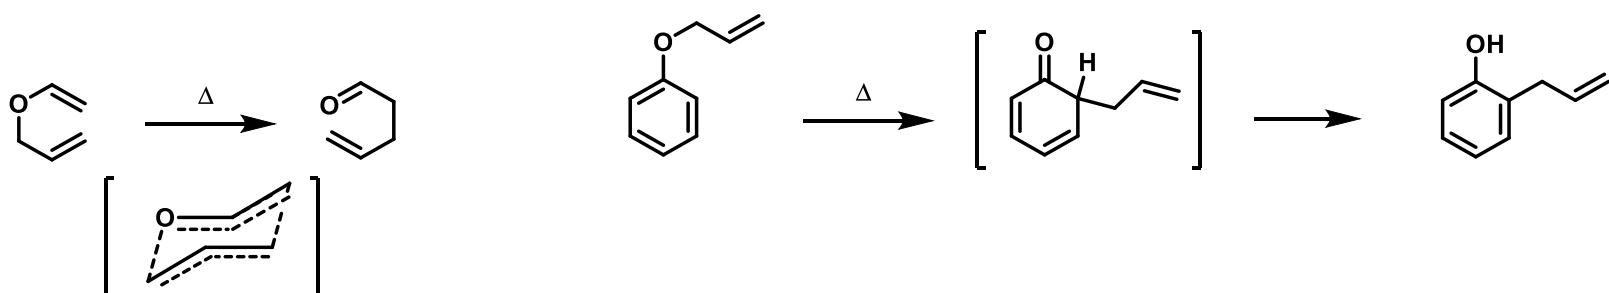

J. Am. Chem. Soc. **1979**, *101*, 2493.

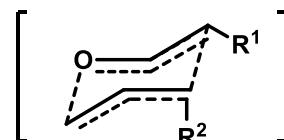

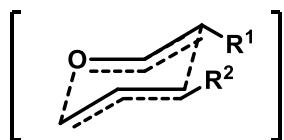

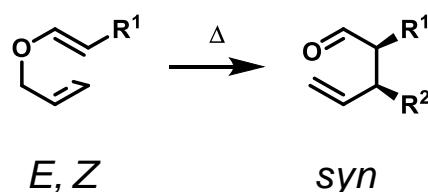

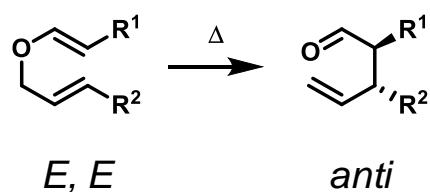

J. Am. Chem. Soc. **2002**, *124*, 9199.

Claisen rearrangement

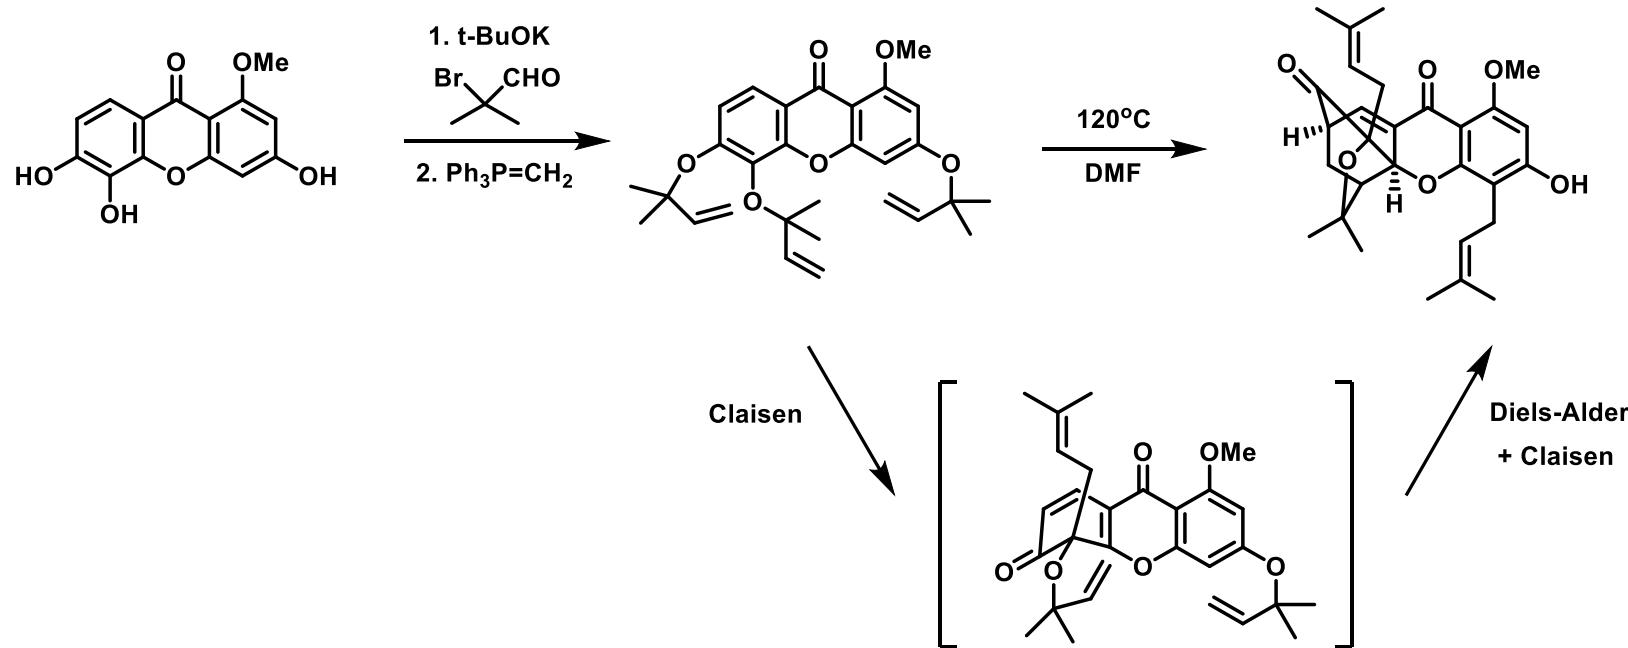

- reliable method for introduction of double bond in combination with *defined stereochemistry* at C atoms bearing R¹ and R²

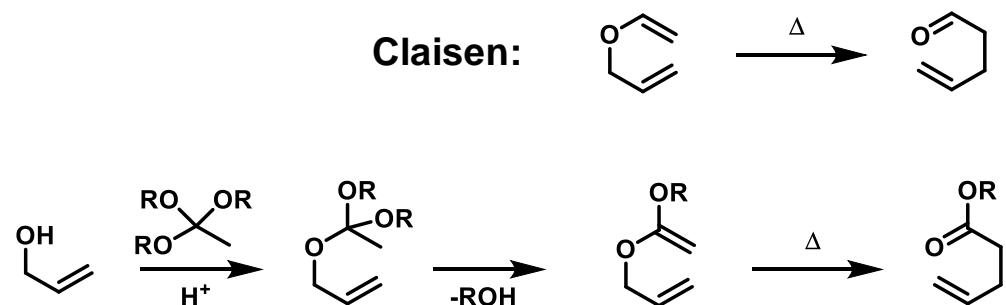

?

?

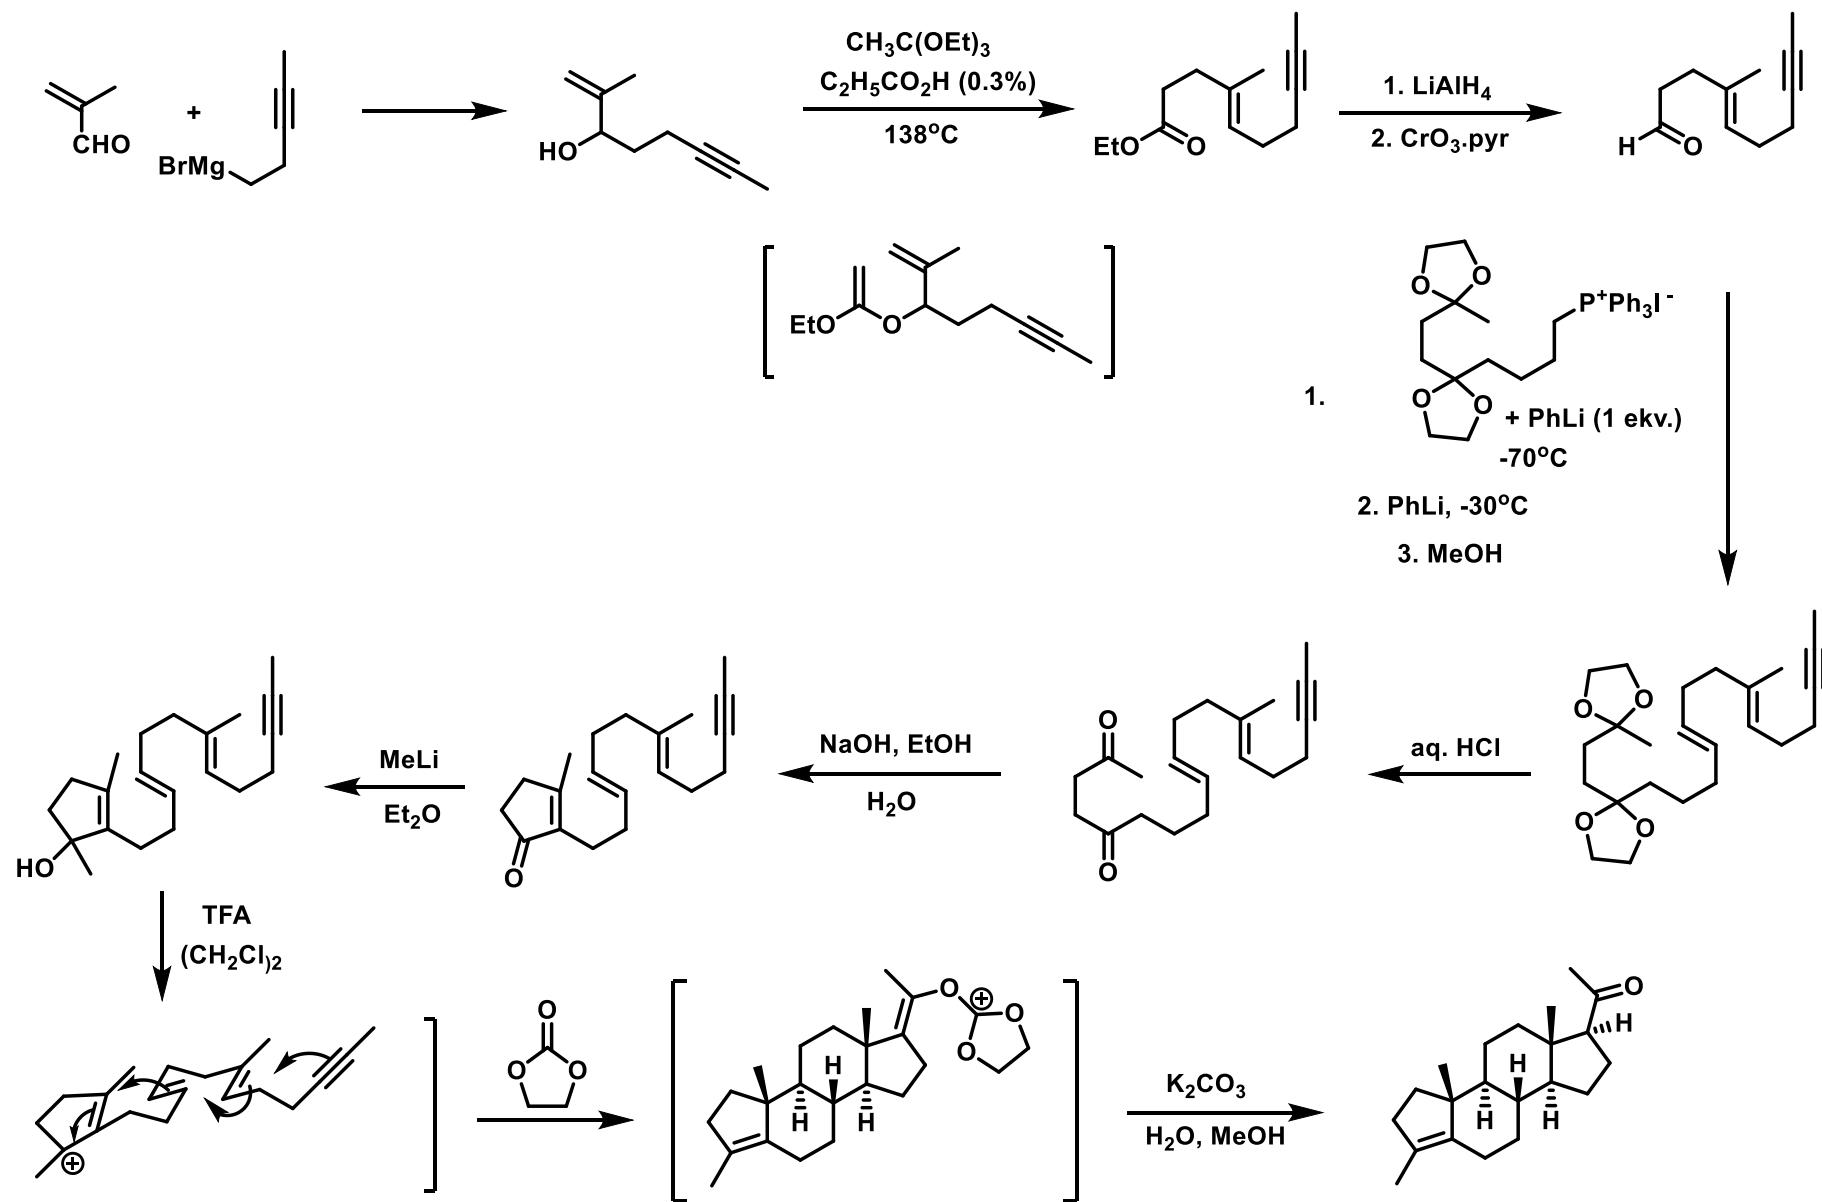

biomimetic synthesis of 1-O-methylforbesione:

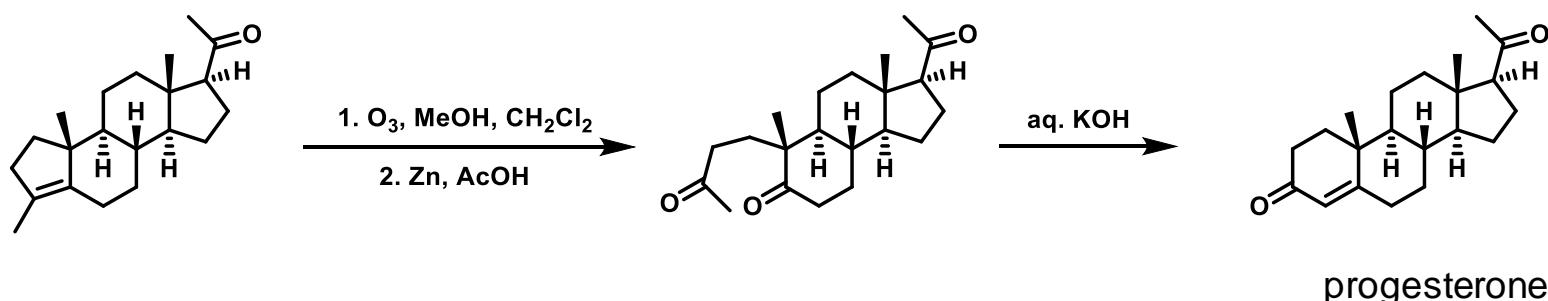

Johnson-Claisen rearrangement (of ketene acetals)

- preparation of γ,δ -unsaturated esters

?

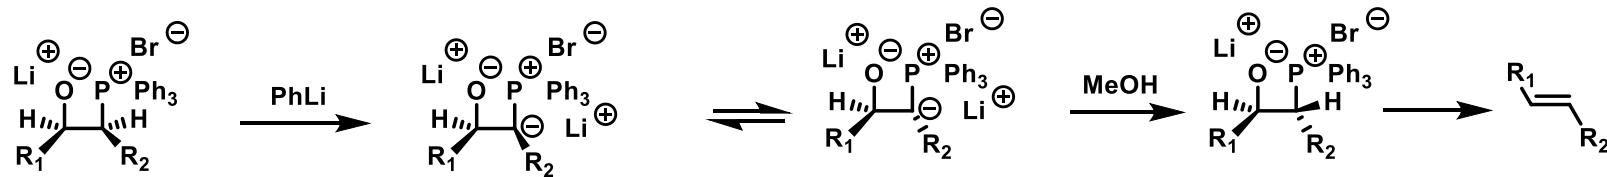

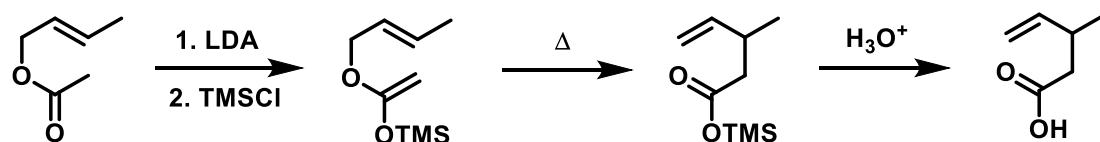

J. Am. Chem. Soc. **1978**, *100*, 4274.

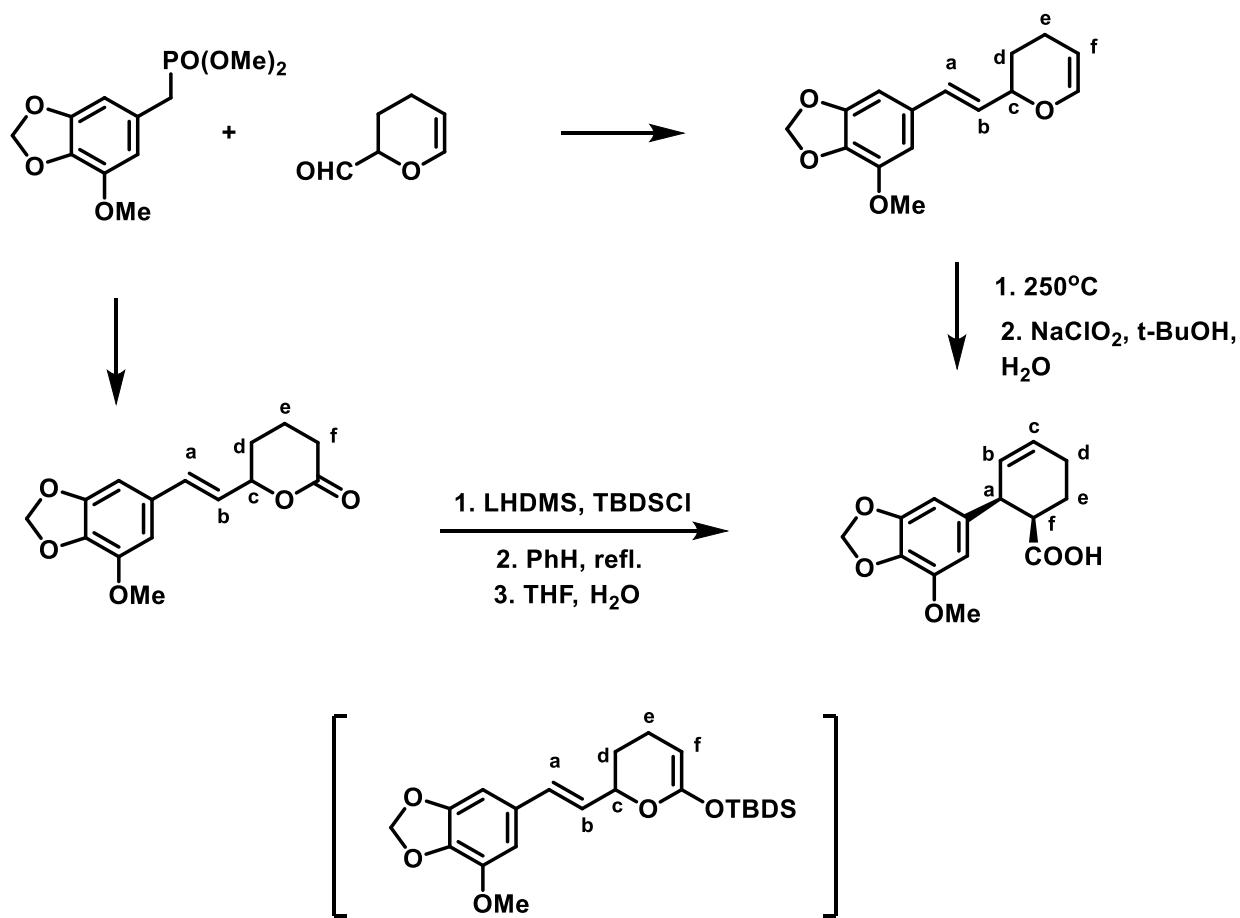

Note: Schlosser modification of Wittig reaction

- preparation of (*E*)-olefins using *nonstabilized ylides*

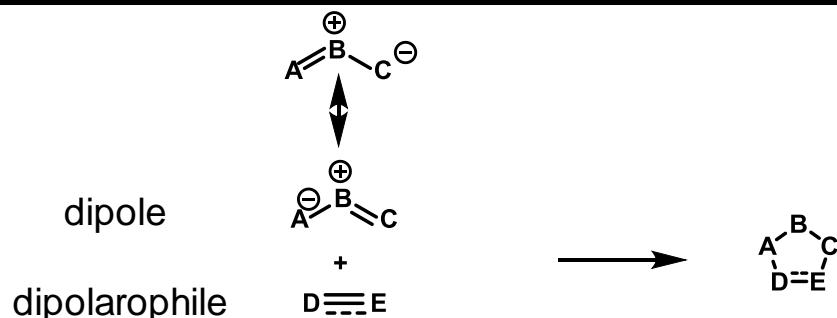

Ireland-Claisen rearrangement (of allyl ester enolates)

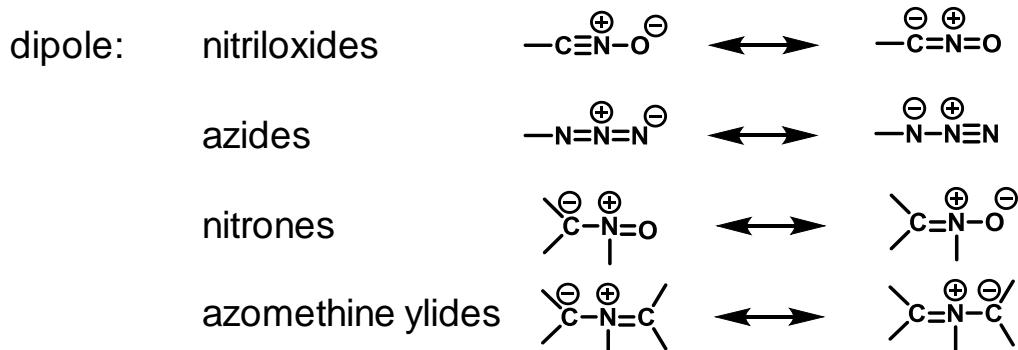

?

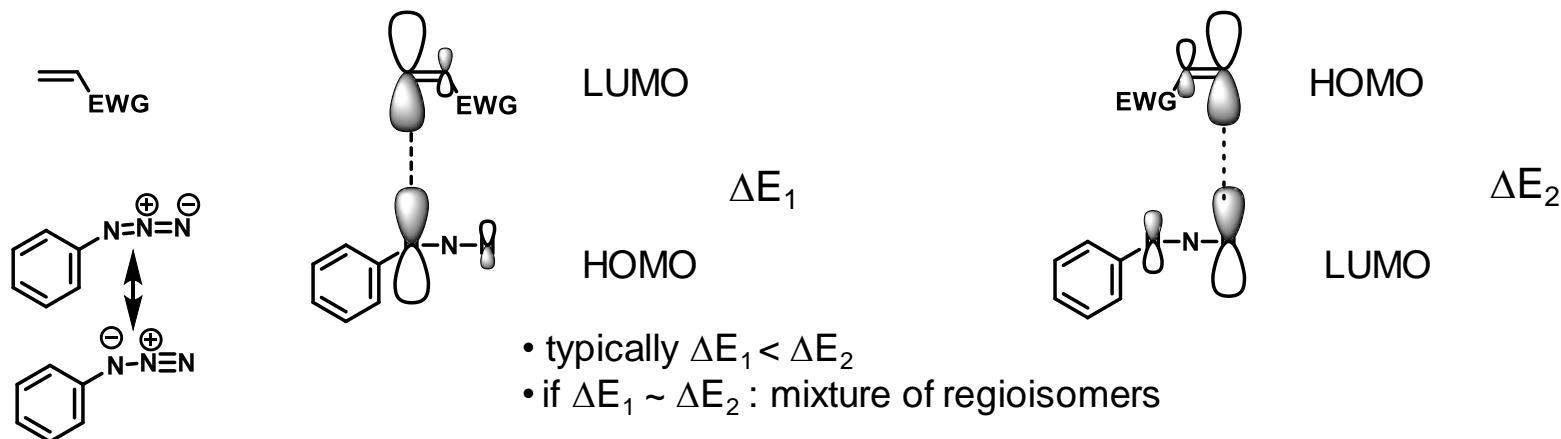

J. Org. Chem. **2004**, 69, 112.

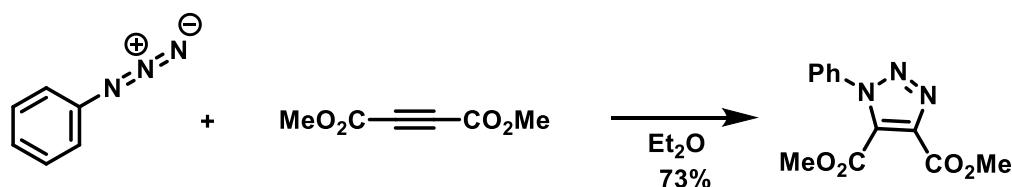

dipolarophile: essentially any double/triple bond

regioselectivity: HOMO – LUMO interaction (overlap of MO parts on atoms with larger coefficients)

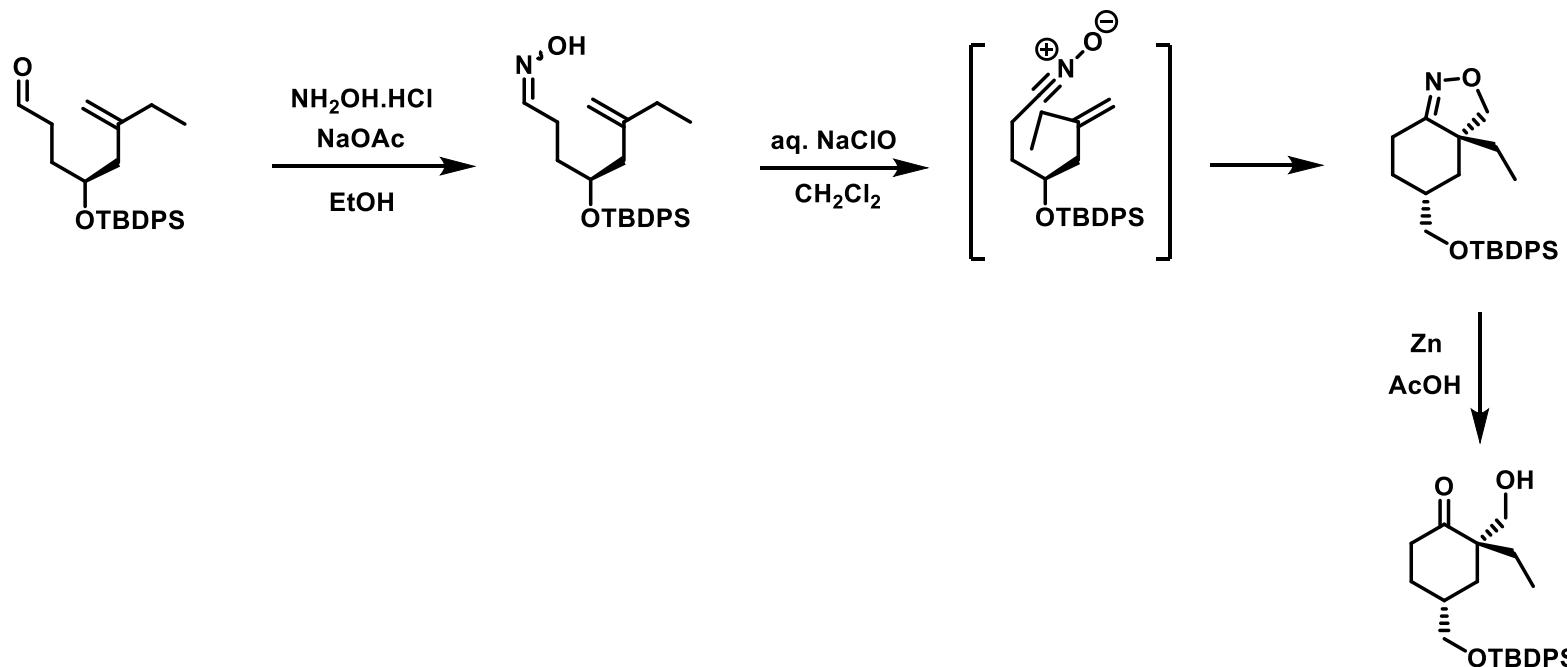

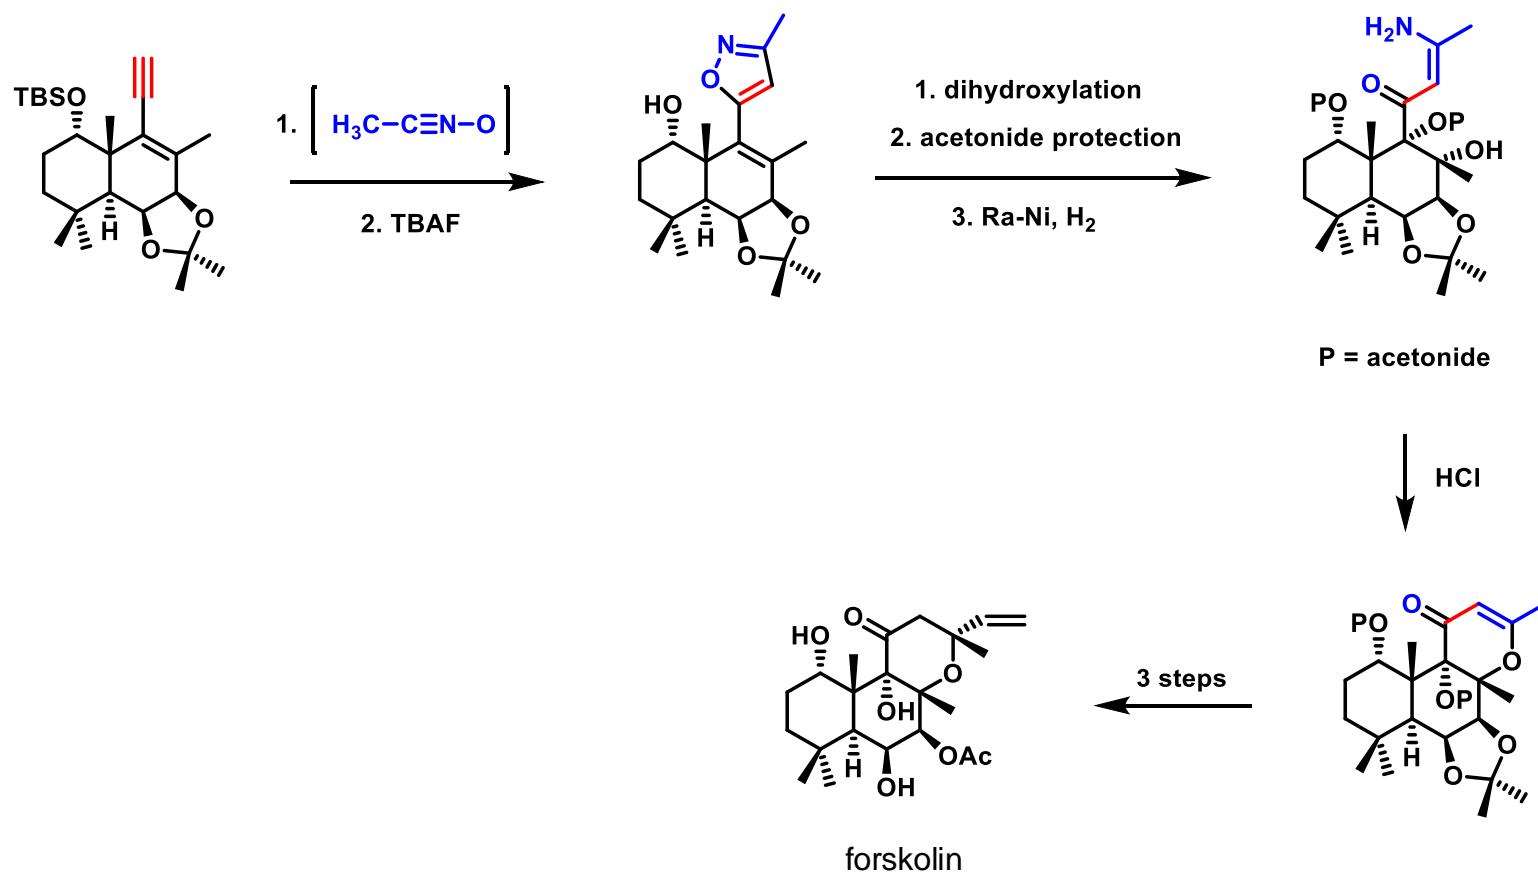

click reaction: Cu(I) catalyzed triazole formation

frequently used in biology; can be done in the cell (in vivo)

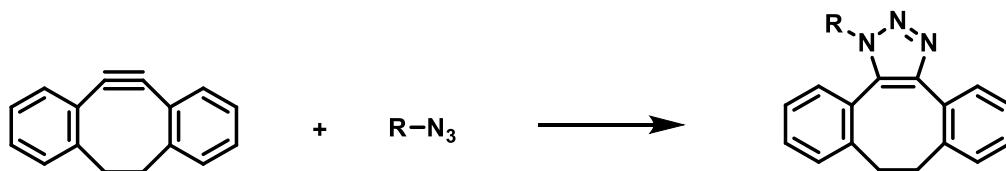

nitrile oxides: frequently used dipoles

Angew Chem. Int. Ed. **2017**, *56*, 12586.

Strain-promoted azide-alkyne cycloadditions

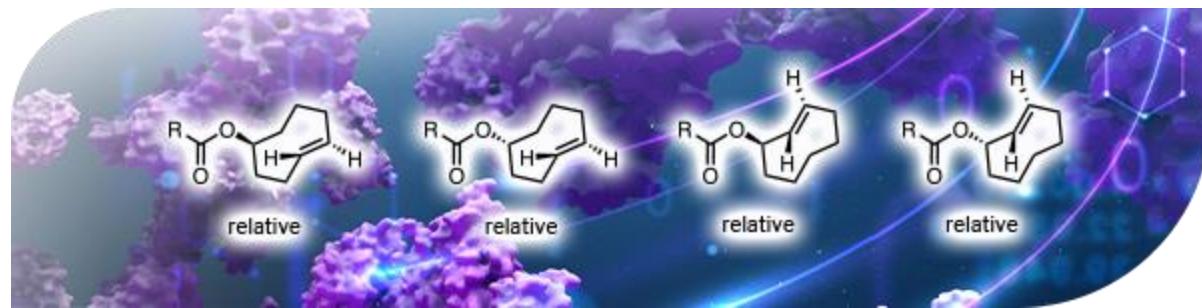

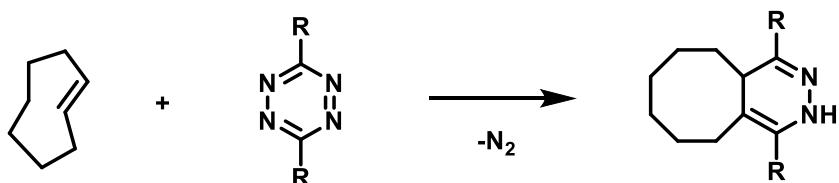

OCT (0.0012)	DIMAC (0.0030)	SYPCO (0.020)	PYRROC (0.060)	DIFO (0.076)	TRIPCO (0.083)	BCN (0.14)	DIBO (0.17)
DIFBO (0.22)	DIBAC/DBCO (0.31)	F ₂ -DIBAC (0.50)	BARAC (0.96)	FMDIBO (1.0)	keto-FMDIBO (3.5)	TMTH (4.0)	

Chem. Eur. J. 2021, 27, 5057.

Inverse electron-demand Diels-Alder reaction

- click reactions with trans-cyclooctene
- widely used in chemical biology (protein labelling and imaging)

Chem. Soc. Rev. 2017, 46, 4895.
