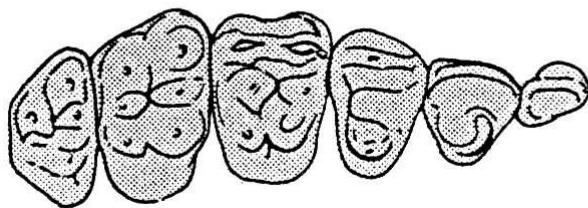

**Figure 9-2** Continental drift. Changes in position of the continental plates from Late Paleozoic to Late Eocene. (a) The position of the continents at the end of the Paleozoic (c. 250 m.y.a.). Pangea is breaking up into a northern land mass (Laurasia) and a southern land mass (Gondwanaland). (b) The position of the continents during much of the Paleocene and Eocene (up to c. 45 m.y.a.). Note that North America and Europe are still joined but are separate from Asia.
