

Ultrafialová a viditelná spektroskopie

Elektronová spektroskopie

Sluneční světlo

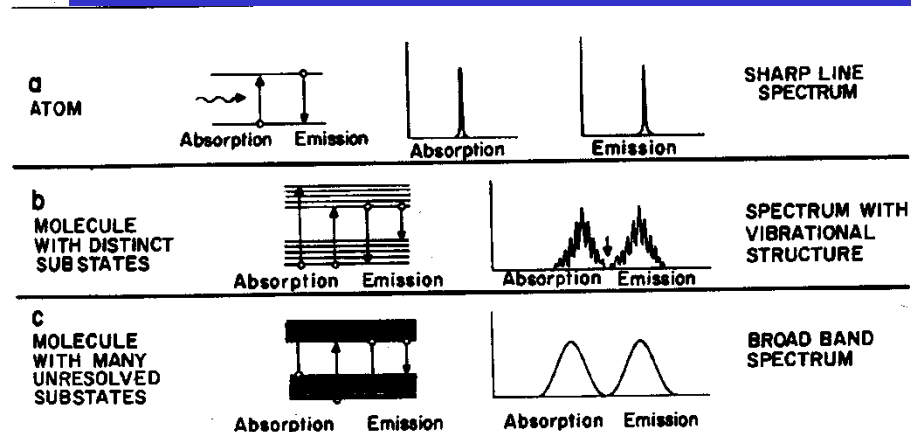

Co měří UV-VIS spektroskopie? fyzikální podstata

λ / nm	
185 - 200	Vacuum-UV
200 - 380	Near-UV (quartz)
380 - 780	Visible

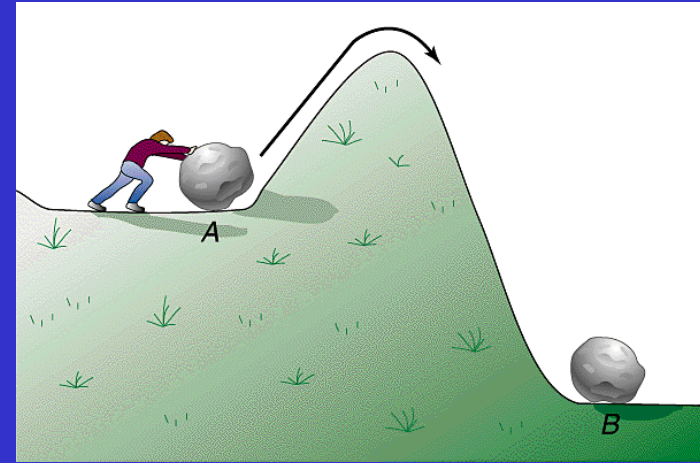

$$E_{\text{int}} = E_{\text{el}} + E_{\text{vib}} + E_{\text{rot}}$$

$$E = h \nu$$

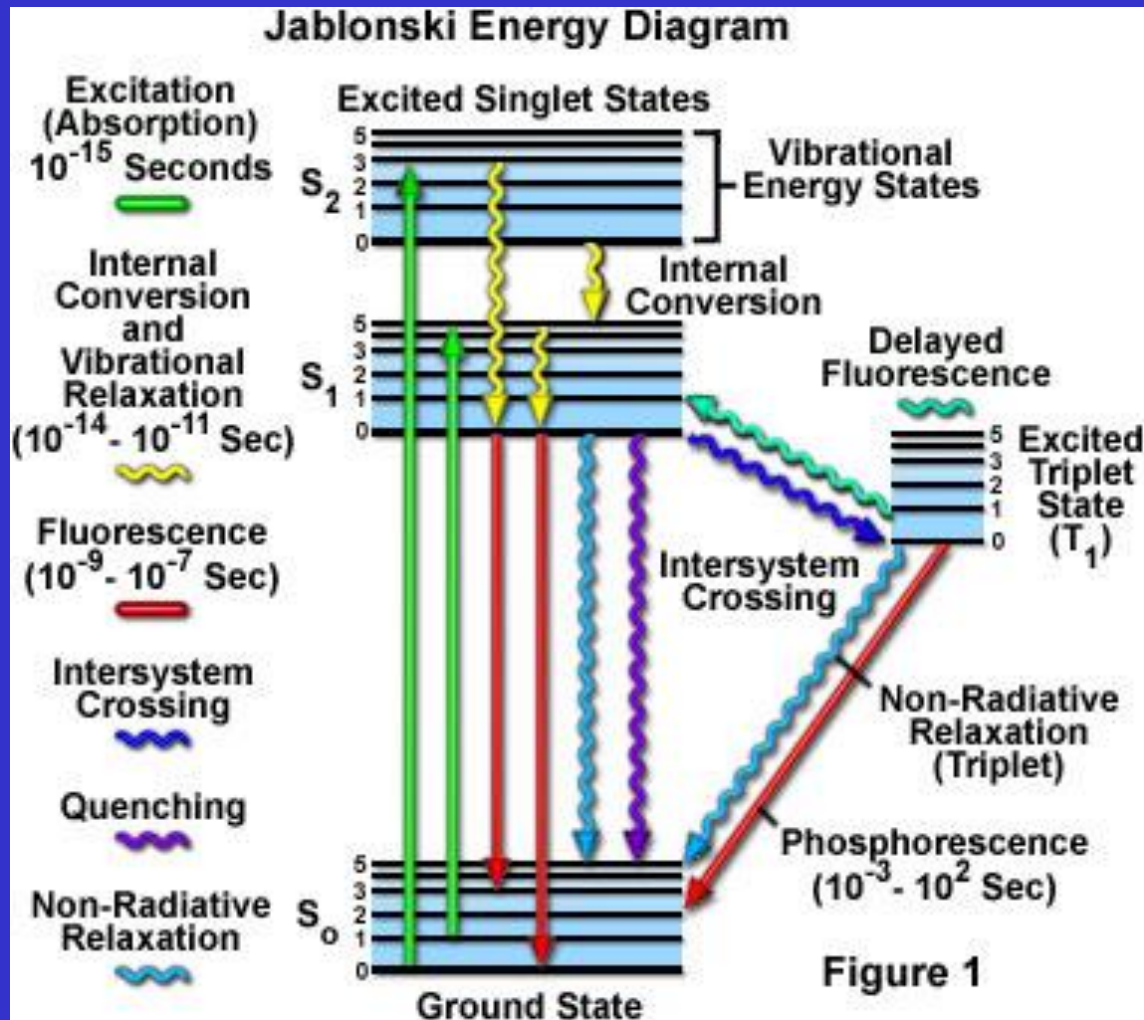

PES

Plochy potenciální energie

Jablonskiho energetický diagram

Franck-Condon Principle

Spektrum

$$x \sim E \sim \tilde{\nu} \sim 1/\lambda$$

$y \sim$ intenzita \sim pravděpodobnost přechodu \rightarrow síla oscilátoru

$$f \equiv 4.3e-9 \int \varepsilon d\tilde{\nu} \sim 4.3e-9 \varepsilon_{\max} \Delta\tilde{\nu}^{1/2}$$

$$E = h\nu = hc/\lambda = hc\tilde{\nu}$$

Beer – Lambert – Bouguer law

$$-\log \Phi_t / \Phi_0 = -\log \tau_i = \varepsilon cb = A$$

$\tau_i = \Phi_t / \Phi_0$ vnitřní transmittance (transimisní faktor)

$\rho = \Phi_r / \Phi_0$ reflektance, reflexní faktor

$\alpha = \Phi_a / \Phi_0 = 1 - \tau$ absorptance, absorpční faktor

Veličina	Symbol	Jednotka
monochromatický zářivý tok	Φ	W
(dekadická) vnitřní absorpance	A	1
molární (dekadický) absorpční koeficient	ε	$\text{L mol}^{-1} \text{cm}^{-1}$
absorpční dráha	b	cm^{-1}
optická dráha kvety	l	cm^{-1}

Jednopaprskový UV – vis spektrometr

Fig. 4.1. Optical geometry of a single beam instrument, the Uvikon 710 by Kontron Instruments, Eching.

Dvoupaprskový UV – vis spektrometr

Fig. 4.2. Schematic diagram of the optical pathway in a double beam instrument Lambda 2, Perkin Elmer, Überlingen.

Dvoupaprskový, dvoumřížkový

UV – vis spektrometr

Fig. 4.3. Double beam set-up with a double monochromator for very precise photometric measurements and the possibility of taking high resolution spectra (Lambda 9, Perkin Elmer, Überlingen). This instrument covers the wavelength range from the UV until the near infrared (NIR).

Jednopaprskový UV – vis spektrometr s diodovým polem

Jak funguje spektrometr?

UV – vis spektrometr

Zdroj

- čarový x spojitý
- rtuťová-halogenová výbojka <330; 1200> nm
- D₂ lampa <UV; 330> nm
- Xe výbojka <190; 1000> nm

Spektrometr

- jednopaprskový x dvouprskový
- sekvenční x simultánní

Detektory

Kyvety

- tvar
 - objem
 - materiál
- foto-emisní detektory (vakuované fotonky, fotonásobiče ...)
 - polovodičové detektory (fotovodivostní detektory, fotodiody, fotonásobiče; detektory s prostorovým rozlišením – CCD –charge-coupled device)

Lampy

Absorpční pásy organických molekul

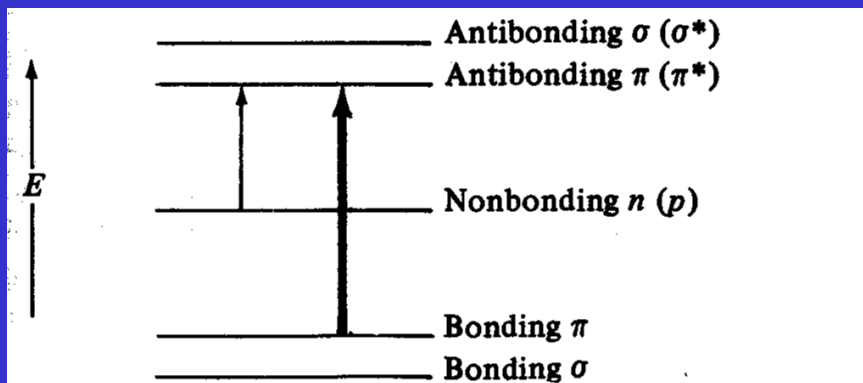

FIGURE 7.5. Summary of electronic energy levels. Both $n \rightarrow \pi^*$ and $\pi \rightarrow \pi^*$ (heavy arrow) transitions are represented.

Typ přechodu	ϵ_{\max}
$n \rightarrow \pi^*$ (R)	< 100
$\pi \rightarrow \pi^*$ (K)	> 10 000
(B – benzenoid)	~ 500
(E – ethylenic)	2000 – 14 000

Table A-4. Ultraviolet "cut-off points"^{a)} of spectroquality solvents commonly used in UV/Vis-Spectroscopy, for 1 cm pathlengths (accuracy *ca.* ± 5 nm)^{b)}.

^a The "cut-off point" in the ultraviolet region is the wavelength at which the absorbance approaches 1.0 using a 1-cm cell path with water as the reference. Solvents should not be used for measurements below the cut-off point, even though a compensating reference cell is employed. The cut-off points are very dependent on the purity of the solvent used. Most of the solvents listed above are available in highly purified "spectrograde" quality.

^b Compiled from the following references:

solvatochromism

change in the position, intensity, and shape of absorption bands due to the surrounding medium

= **perichromism** (peri - around)

surrounding medium - liquids, solids, glasses, and surfaces

- negative solvatochromism
a blue (hypsochromic) shift

- positive solvatochromism
a red (bathochromic) shift

Reichardt's dye

betaine-30

2,6-diphenyl-4-(2,4,6-triphenyl-pyridium)phenolate

- dipole moment - dipole/dipole, dipole/induced dipole interaction
- π electron system - dispersion interaction
- phenolate oxygen - highly basic EPD center

dipole moment
in 1,4-dioxane

$$\mu_g = 14.8 \pm 1.2 \text{ D}$$

$$\mu_e = 6.2 \pm 0.3 \text{ D}$$

$E_T(\mathbf{30})$ and E_T^N scale of solvent polarity

E_T - molar electronic transition energy

$$[E_T] = \text{kcal/mol}$$

$$[E_T^N] = 1$$

$$E_T(\mathbf{30}) = hc \tilde{\nu}_{\max} N_A = (2.8591 \times 10^{-3}) (\tilde{\nu}_{\max} / \text{cm}^{-1}) \\ = 28591 / (\lambda_{\max} / \text{nm})$$

$$E_T^N = (E_T(\text{solvent}) - E_T(\text{TMS})) / (E_T(\text{water}) - E_T(\text{TMS})) \\ = (E_T(\text{solvent}) - 30.7) / 32.4$$

$$E_T^N(\text{TMS}) = 0.000 \quad E_T^N(\text{H}_2\text{O}) = 1.000$$

TMS = Tetramethylsilane

Látka	E_T^N
<i>n</i> -hexan	0.009
Dichlor methan	0.309
EtOH	0.608
Voda	1
