

Chemical photocatalysis using visible light

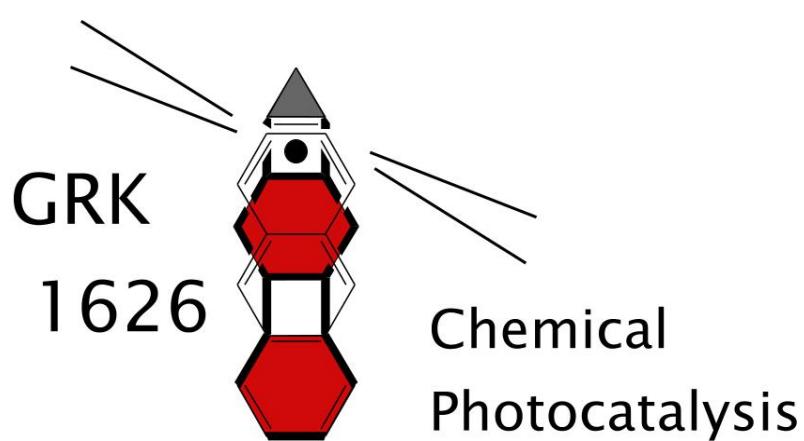

Burkhard König

University of Regensburg, Department of Chemistry and Pharmacy

D-93040 Regensburg, GERMANY

The use of visible light for organic synthesis is a very old idea: More than 100 years ago the Italian chemist Giacomo Ciamician discovered and promoted the field. Recently, photoredox chemistry mediated by metal complexes, such as ruthenium-trisbipyridine, or organic dyes, such as eosin, gained enormous interest for applications in organic synthesis.

We present some of the recent results^[1] using photoredox catalysis (PRC) with visible light from our laboratory including photooxidations, oxidative C-C bond formation and photo-Meerwein arylation reactions.
