

# CHEMICAL KINETIC DATA FOR STRATOSPHERIC MODELING

The present compilation of kinetic data represents the 12th evaluation prepared by the NASA Panel for Data Evaluation. The Panel was established in 1977 by the NASA Upper Atmosphere Research Program Office for the purpose of providing a critical tabulation of the latest kinetic and photochemical data for use by modelers in computer simulations of stratospheric chemistry. The recommended rate data and cross sections are based on laboratory measurements. The major use of theoretical extrapolation of data is in connection with three-body reactions, in which the required pressure or temperature dependence is sometimes unavailable from laboratory measurements, and can be estimated by use of appropriate theoretical treatment. In the case of important rate constants for which no experimental data are available, the panel may provide estimates of rate constant parameters based on analogy to similar reactions for which data are available.

Rate constants are expressed in the form  $k(T) = A \exp(-E/RT)$ , where  $A$  is the pre-exponential factor,  $E$  the activation energy,  $R$  the gas constant, and  $T$  the absolute temperature. Uncertainties are expressed by the factor  $f$ , e.g., a value of  $4.2 \times 10^{-10}$  with  $f = 2$  indicates that the true value is believed to lie between  $2.1 \times 10^{-10}$  and  $8.4 \times 10^{-10}$ . The value of  $f$  at other temperatures may be calculated from  $f(298)$ , given in the last column, by:

$$f(T) = f(298) \exp[(\Delta E/R)(1/T - 1/298)],$$

where  $\Delta E/R$  is the uncertainty in  $E/R$ .

Table 1 covers rate constant data on second order reactions, grouped by class, while Table 2 covers association reactions. Relevant equilibrium constant data are given in Table 3. All concentrations are measured in molecules  $\text{cm}^{-3}$ . Notes on each reaction, as well as related photochemical data, may be found in the reference.

The assistance of Robert Hampson is gratefully acknowledged.
