Summary

Toxicology is about doses

- The goal is LD(LC)50 or NOAEL/NOEC

Legislation defines

- ... what assays and how to do them
- About 30 assays
- The most widely used standard OECD Guidelines for Testing of Chemicals

• Replacing "black box" in traditional testing

- Synthesis of mechanistic and omics data
- Adverse Outcome Pathways
- Strategically supported by OECD, EU, USA

Do we need testing with animals?

Are there alternatives

"Alternatives" to toxicity testing ... 3R rules

12½

Replacement

3Rs

REFINEMENT

Why doing replacement, reduction, refinement?

Because activists put pressure to do so?
Because animal welfare is a concern for EU citizen?
Because animal testing is "bad" and "alternatives" are good?
Because I will get "better" results?
Because it is cutting edge technologies?
Because I have to? E.g. EU law directive 2010/63/eu, ban on animal testing for cosmetics

3Rs are driven by EU laws, little by Member States.
 Scientific agenda is not driven enough by scientists itself...
 Academia is in general more reactive than proactive e.g. stop vivisection's ECI

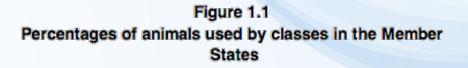

European Policies on 3Rs

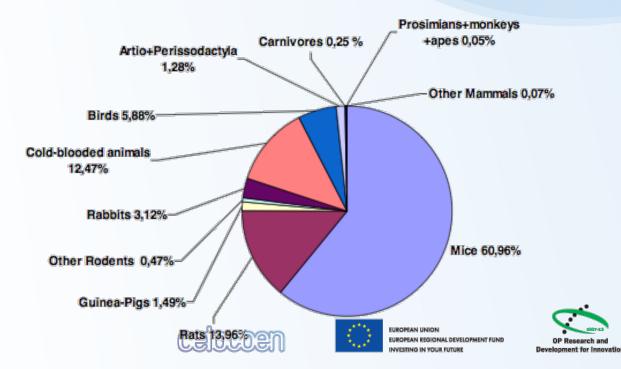

DIRECTIVE 2010/63/EU OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 22 September 2010

on the protection of animals used for scientific purposes

- + Repeated Dose Toxicity
- + Reproductive Toxicity
- + Other
- + Acute Toxicity to Fish

TSAR is a tool to provide a transparent view on the status of alternative methods as they progress from purely scientific protocols submitted for prevalidation to being actively used in a regulatory context.

This tracking system intends to cover all steps, from the initial submission for pre-validation until final adoption by inclusion in the EU legislation and/or related Guidance Documents, when appropriate. It is worth mentioning that not all alternative methods will or need to be included in the Test Methods regulation (TMR, Commission Regulation (EC) No 440/2008 of 30 May 2008), as this Regulation only contains relevant methods for the assessment of properties of chemicals that fall directly under its remit (see below some links to relevant legislation that contains data requirements). In addition to TMR, a number of methods are used on a day to day basis in a regulatory context through other product related guidance, as part of intelligent testing strategies or as pre-screening methods. Regardless of the way of implementation, they all contribute to the replacement, reduction and refinement of the use of animals in scientific procedures.

The process of validation and regulatory approval has been broken down into a number of steps. Although this is a continuous process that may, sometimes, also involve some iterations, for practical reasons it has been broken down in two parts:

A) Review and Validation.

B) Regulatory Approval (see simplified scheme for alternative methods).

These have, on its turn, been broken down into several stages. An explanation of each stage can be found by clicking on the submenus of the "The Process" menu on the left side of the screen.

The methods whose status of validation or regulatory acceptance are tracked here have been grouped by the relevant endpoint they cover, as can be seen in the left side menus.

However, currently, the system only contains information tracking specific alternative methods in terms of the <u>regulatory approval part</u> from the stage "Validation statement" onwards. The remaining parts of the TSAR web site dealing with the other stages in the process of validation and regulatory approval are under construction and it is foreseen that they will be added in the near future. Some other utilities as site searching capabilities will also be added in future.

The drop-down menus on the left hand side of the screen allow the user to display the information on individual alternative methods by just clicking on them.

The test methods have been classified according to a simple colour code: Green: Already in the EU legislation or other regulatory use. Orange: Undergoing process to be incorporated in the EU regulatory context. Purple: No regulatory use identified.

>60 3Rs Tests submitted to ECVAM since 2008 (update 01/2015)
10 validated or ongoing validation => Prioritisation!

Update - quantitative mechanistic/computational toxicology

Update – quantitative mechanistic/computational toxicology

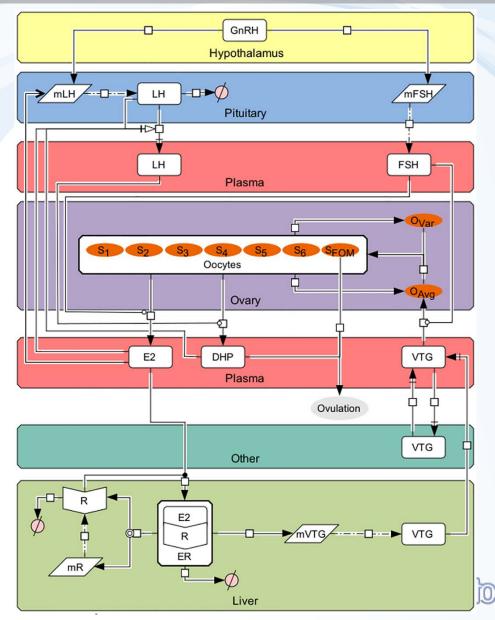

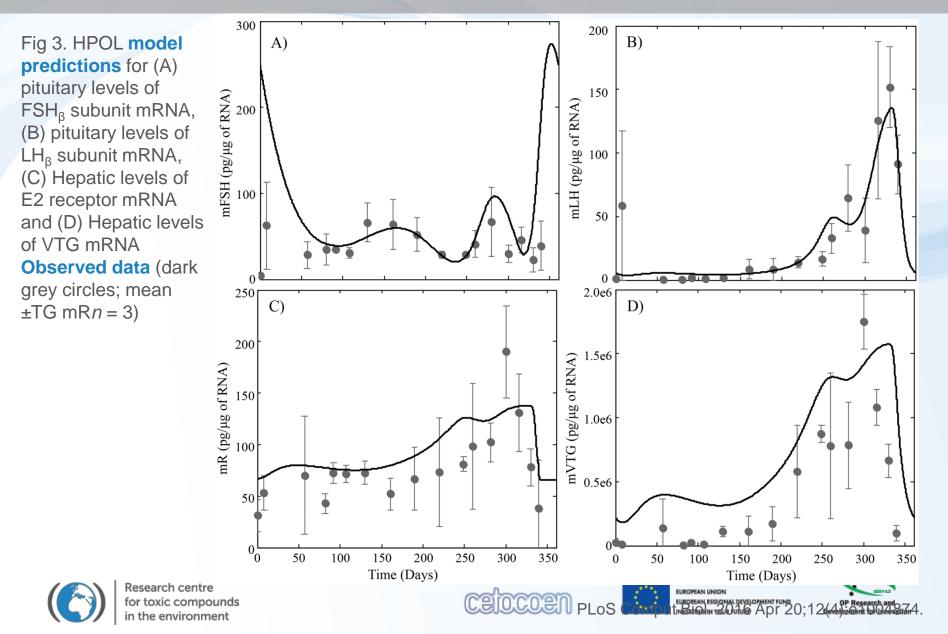

Fig 1. The HPOL signaling network in rainbow trout as formulated in our model.

Arrows and symbols on graph follow CellDesigner vs. 4.4 notation (www.celldesigner.org). GnRH is secreted from the hypothalamus into the pituitary stimulating the production of mFSH and mLH, which then leads to formation of FSH and LH, respectively. FSH, which is being continuously secreted from the pituitary, travels to the ovaries to stimulate production of E2. E2 then travels to the liver to bind with E2 receptors (R; translated from mR) to form ER. ER then stimulates the production of mVTG, which produces VTG₁. Secreted VTG then travels from the liver to the ovaries via the plasma (VTG_P) where it is absorbed by follicles in stages 3 through 6 (the proportion of follicles in these stages are denoted by S_i , j = 3, 4, 5, and 6) during vitellogenesis, the rate of which is affected by FSH_P, to promote oocyte growth (O_{Avg}). Oocyte growth then progresses the oocytes through the stages using a Weibull distribution created from O_{Avg} together with O_{Var}. In the later stages LH_p stimulates the oocytes to produce DHP. Finally, oocytes undergo final maturation (S_{FOM}) and combined with DHP, determine when the fish ovulates

Closing remarks

- Ecotoxicology is exciting science!
- Interface: science and society
- Many opportunities
- Sometimes hard work
 10% inspiration and 90% "perspiration"

- Be creative: move frontiers
- Keep the purpose in mind
- Be critical: do not accept perceptions as facts
- Speak up: you have something to say!
