

BIOMARKERS AND TOXICITY MECHANISMS 05 – Mechanisms - DNA

Luděk Bláha, PřF MU, RECETOX www.recetox.cz

Tento projekt je spolufinancován Evropským sociálním fondem a státním rozpočtem České republiky.

INVESTICE DO ROZVOJE VZDĚLÁVÁNÍ

DNA

- principal molecule for life
- structure and function carefully checked
- changes rapidly repaired
- irreversible changes → cell death (physiologically by apoptosis)

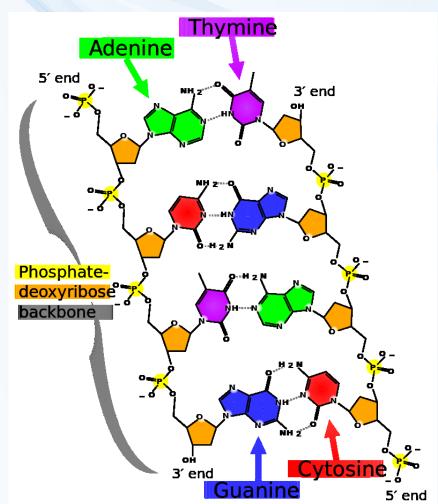

Mutagenesis → MUTATIONS

→ variability and evolution or → damage to DNA (structure or coding)

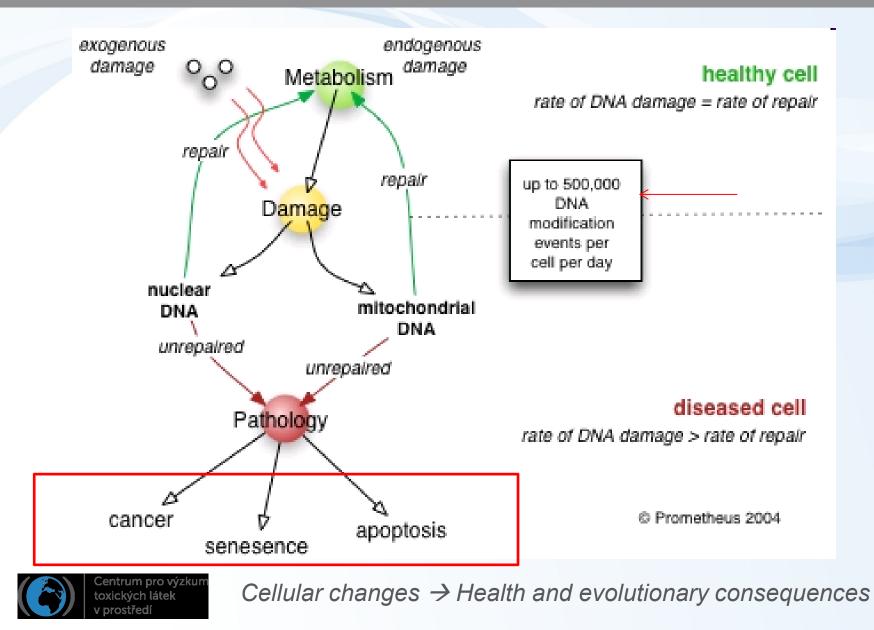

... naturally

billions of nucleotides/day → most are repaired ... stress-induced → toxicity

DNA damage and its effects

DNA repair

Damage of DNA is carefully controlled constitutively expressed repair systems

Sudden changes in DNA

Induction of additional repair enzymes (e.g. "SOS-repair" in bacteria - biomarker of DNA damage)

Various types of molecular changes in DNA ... and corresponding repair systems

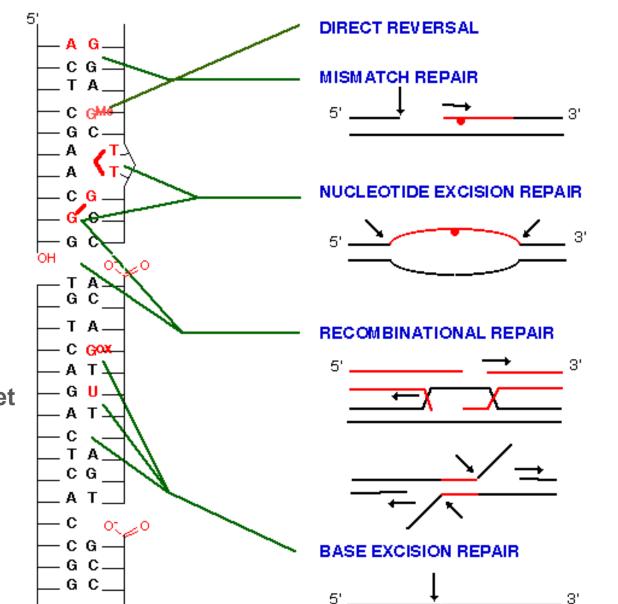

Note!

•Not all nucleotides are affected in the same rate (mutations occur only at specific sites due to physicochemical properties)

Most common patterns:

G - the most frequent target (highly nucleophilic character)
T=T at the same strand
G=G crosslinks

DNA REPAIR SYSTEM

DNA DAMAGE

Complex system of **SOS repair** proteins induced in *E. coli* by DNA damage

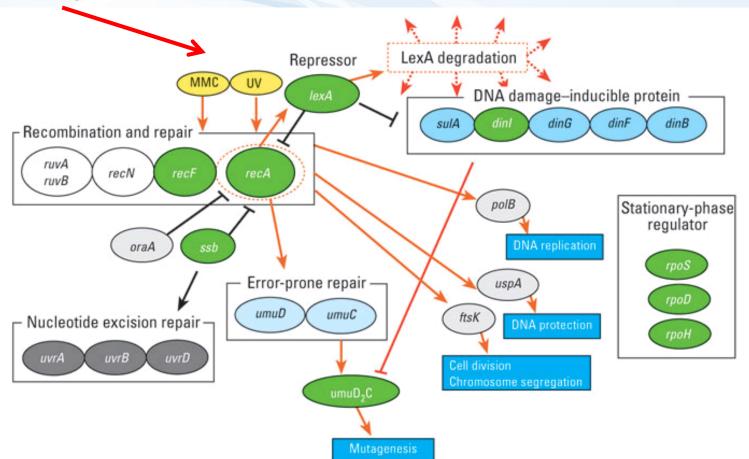

Figure 3. A literature-based linkage map between genes in the SOS response in *E. coli.* The map represents inducible genes/proteins in the SOS response for repair from DNA damage. Black lines indicate pathways in the normal repair process and red lines with arrows activation/induction due to an exposure to damaging agents. Recombination and repair, DNA damage–inducible protein, nucleotide excision repair, error-prone repair, and stationary-phase regulator have family molecules in each box. Green circles are genes used for the analysis.

TYPES of mutations

POINT mutationts

Base exchanges Deletions / Insertions

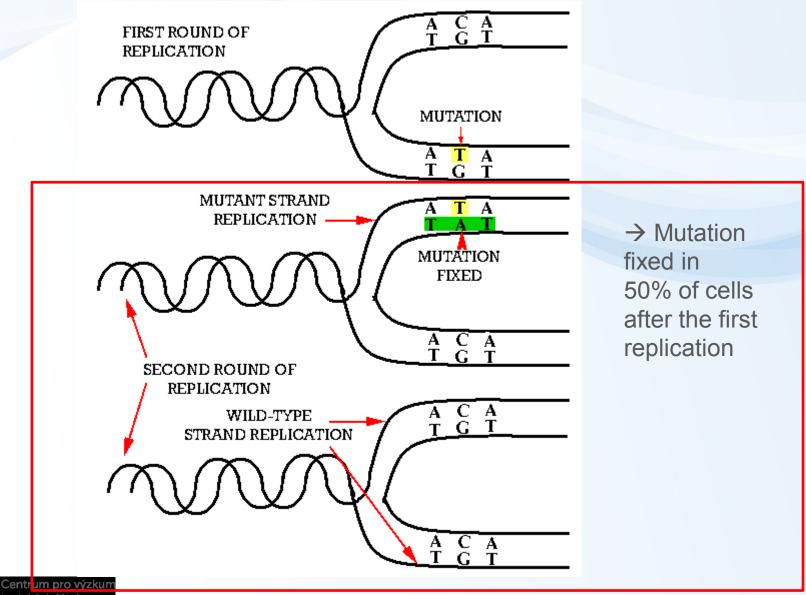

Impacts of point mutations
 (a) silent, (b) missense, (c) nonsense, (d) frameshift

CHROMOSOMAL mutations

→ large scale impact

BASE – EXCHANGE

 Centrum pro vý toxických látek v prostředí

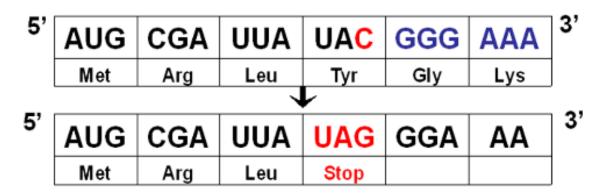

INSERTION DELETION

 \rightarrow reading frame shifts

Insertion

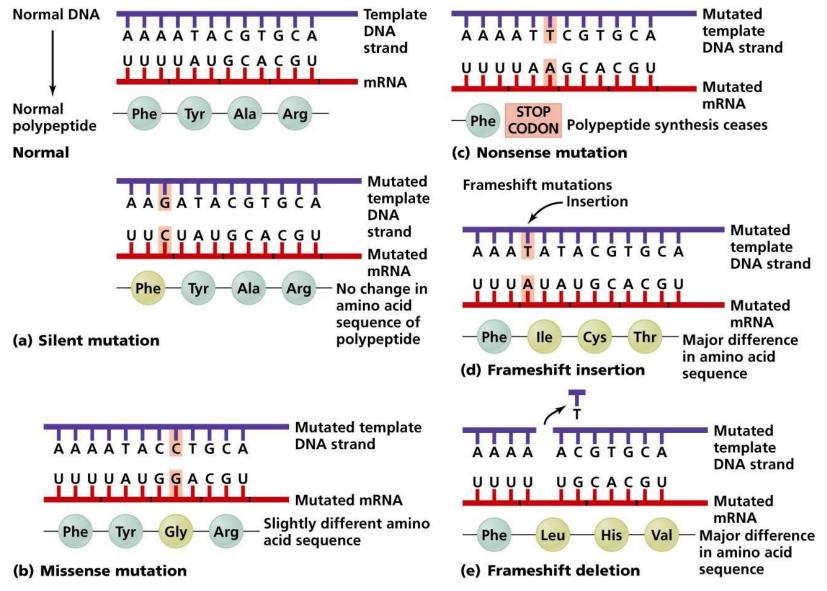

Deletion

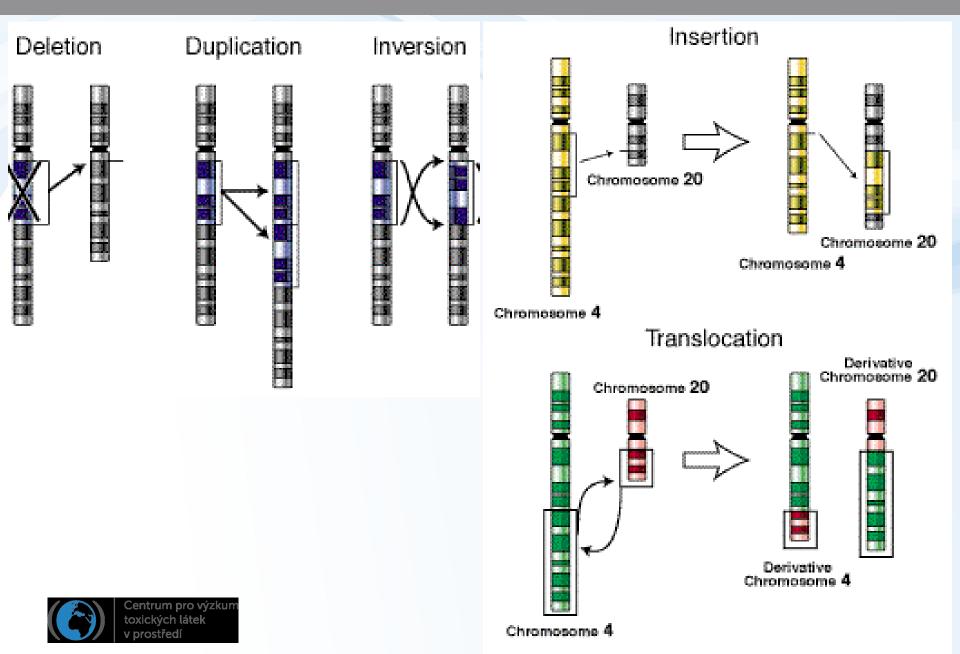

Impacts of point mutations \rightarrow (a) silent, (b) missense, (c) nonsense, (d) frameshift

Large – chromosomal mutations

What are the agents inducing mutations? MUTAGENS

PHYSICAL FACTORS

Ionizating radiation

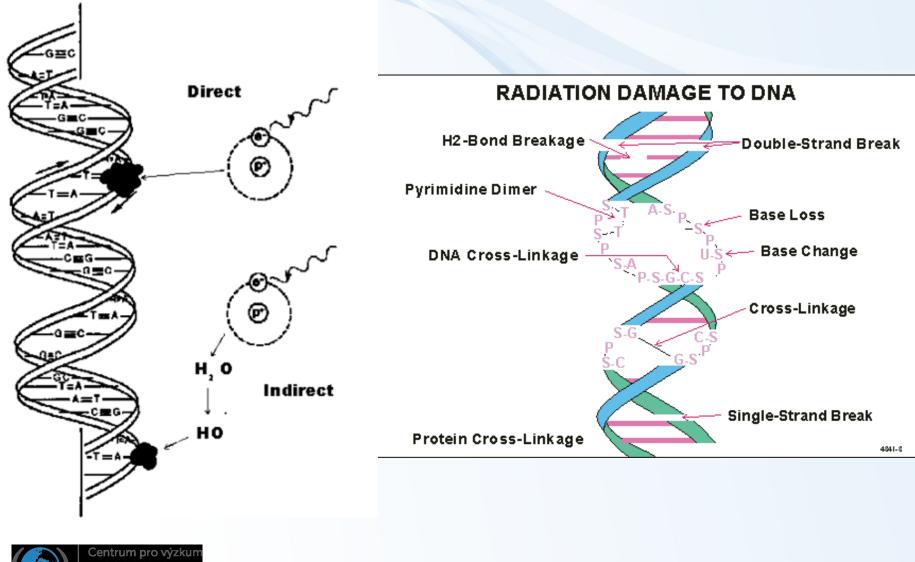

- direct interactions with NA
- interactions with water
 - \rightarrow formation of OH*
 - (and other oxygen radical species ROS)
- → Various impacts on bases and strands

UV radiation

- interaction with aromatic cycles (bases)
- \rightarrow base dimerization (T=T)

Ionizing radiation effects on DNA

toxických látek v prostředí

What are the agents inducing mutations? MUTAGENS

CHEMICALS

1) Small electrophilic molecules

(attracted by nucleophilic/basic sites ... e.g. in DNA)

2) Other reactive molecules

* alkylating and arylating agents – covalent adducts
* specifically intercalating agents

3) Base analogs

inserted during replication instead of nucleotides

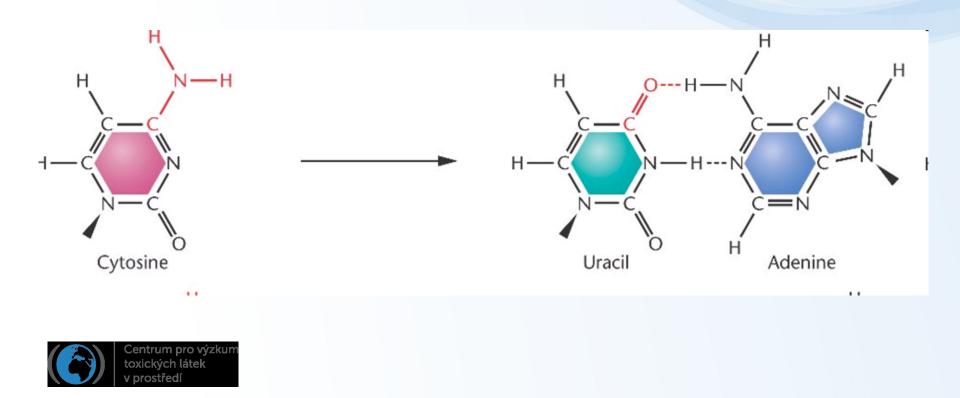

Some compounds may require "activation" by metabolism pro-mutagen (pro-carcinogen) → mutagen (carcinogen)

Small molecules \rightarrow deamination of bases

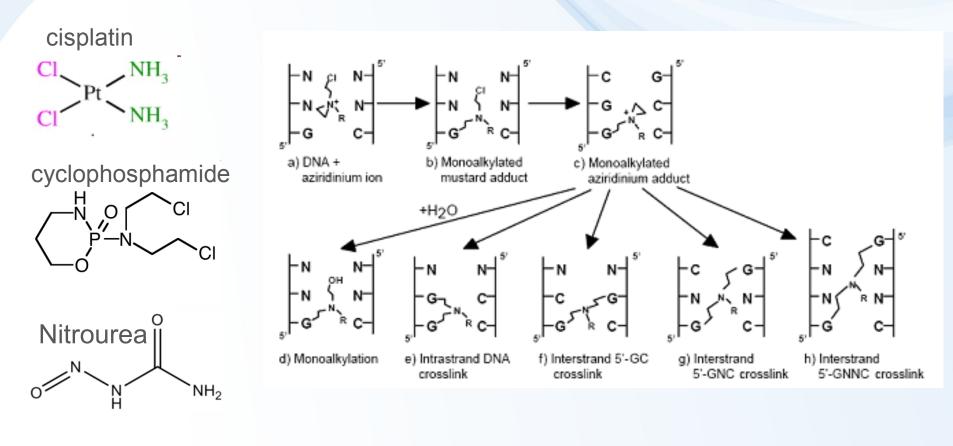

HNO₂, HSO₃⁻ Hydroxylamine (HO-NH2), Methoxyamine (CH3-O-NH2)

Example: oxidation (deamination) \rightarrow CG to \rightarrow TA shift

ALKYLating compounds

Covalent binding to NA (alkylation of bases, crosslinks in dsDNA) Alkylsulphates, Nitro-urea, N-nitroso-alkyles, cis-platinum

ARYLating compounds

Covalent binding, aromatic "adducts" with bases (see also discussion at biomarkers)

Mycotoxins (Aflatoxins) – requires activation

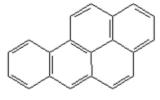

PAHs (benzo[a]pyrene) – requires activation PAH derivatives

- 2-AA, 2-AF (grill produ
- NQO – model mutagel
in experiments

Centrum pro výzkum toxických látek

prostředí

O2N C-NH2

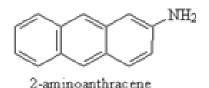

... many others

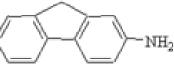

Aflatoxin B₁ 312.27

AF-2 (furylfur amide) 248.19

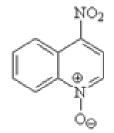

(2-AA) 193.24

2-aminofluorene (2-AF) 181.23

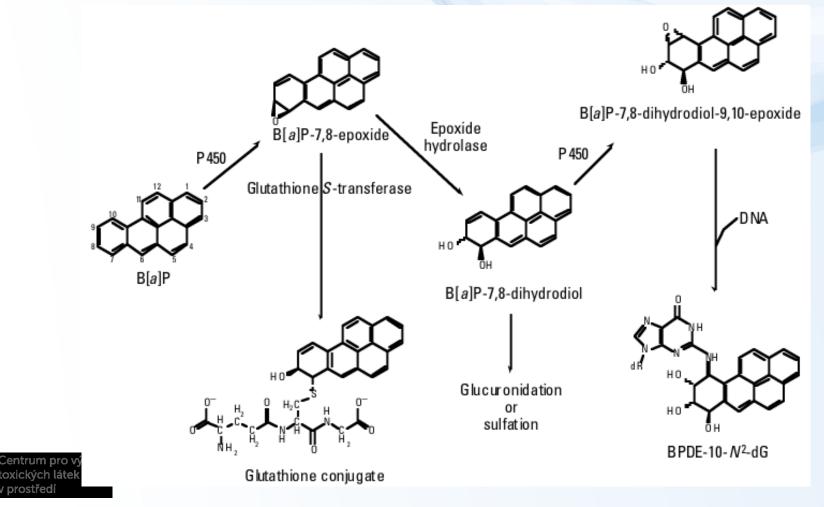

4-nitroquinoline-1-oxide (NQO) 190.15

Bioactivation of benzo[a]pyrene \rightarrow genotoxicity

BaP is oxidized to epoxides and OH-derivatives during detoxification (CYP450) → increased reactivity (including binding to bases ... primarily G or A) (Similar bioactivation e.g. at aflatoxin)

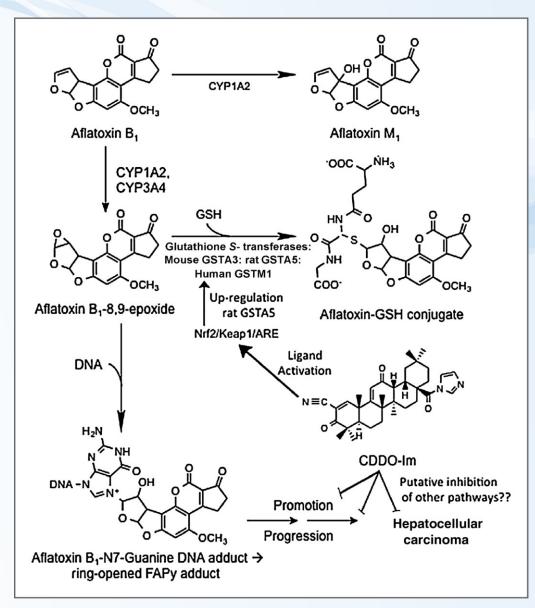

Bioactivation of aflatoxin \rightarrow genotoxicity

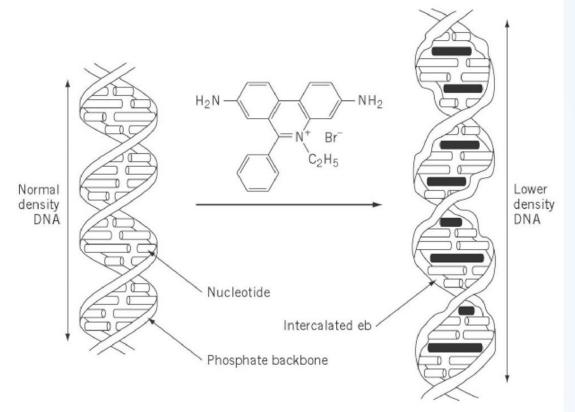

Intercalating agents

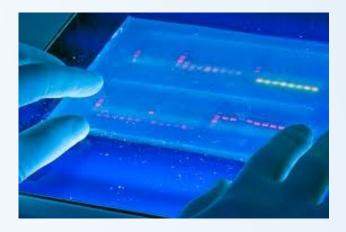

INTERCALATORS

Compounds with characteristic structures "fitting" into DNA → both noncovalent and covalent intercalation

Example 1 – ETHIDIUMBROMIDE

- experimental dye visualization of DNA
- intercalation \rightarrow sharing of electrones with bases \rightarrow high fluorescence

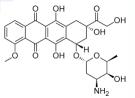

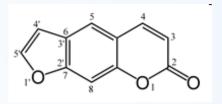

Intercalating agents

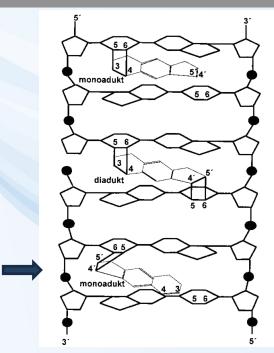

Other intercalator examples

-Anticancer drug - doxorubicin

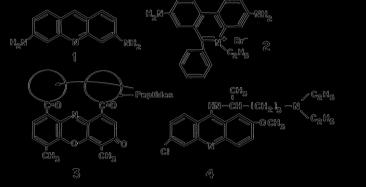

- Psoriasis treatment – psoralen \rightarrow

-Experimental research compnds (e.g. acriflavine) \rightarrow

Cheert 5.8. Examples of interculating agents. Key: 1, acriftanine; 2, athidinen browide; 3, actionmycin; 4, grünnerine.

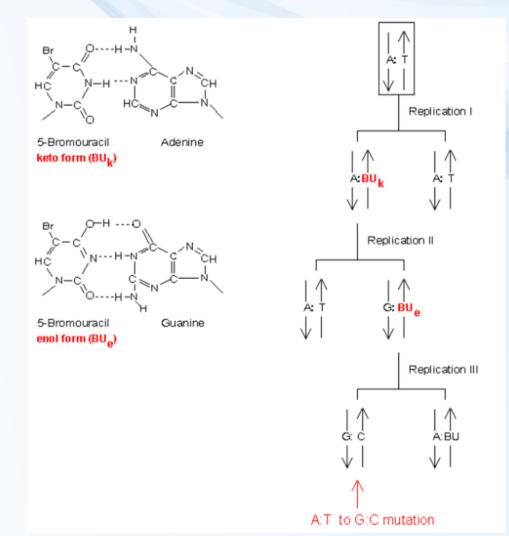

Base analogs

Structure similarity with natural bases

- \rightarrow Incorporation into DNA during replication
- \rightarrow Base exchange mutations

Example
5-Br-Uracil (anticancer drug)
AT → GC shift

Mutations (alleles) and evolution
