

# Mechanochemical Synthesis

## Reaction Setup

**Powder mixing**

**High-energy ball-milling for several hours**

**Ball-to-powder ratio (20:1)**

**Vial (250 ml) and balls (d = 10-20 mm)**

**WC, stainless steel, zirconia**

**250 rotations per minute**

**Controlled atmosphere**

# **Mechanochemical Synthesis**

**Particles repeatedly subjected to deformation, cold welding, and fracture, homogenization on an atomic scale**

**On impact, high energy concentrated in a small spot, stress 200 MPa, duration of microseconds**

**Fragmentation, atomically clean surface exposed**

**Balance between fragmentation and coalescence**

**Grain size ~10 nm**

**Amorphization, product nucleation and crystallization**

# Mechanochemical Synthesis

→ Phase Transitions (to denser structures)

Oxide	Before	V, Å <sup>3</sup>	After	V, Å <sup>3</sup>
GeO <sub>2</sub>	quartz	40.3	rutile	27.6
TiO <sub>2</sub>	anatase	34.1	rutile	31.2
ZrO <sub>2</sub>	baddaleyite	35.2	fluorite	32.8

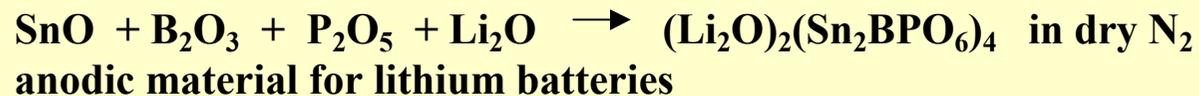

V = volume per formula unit

→ Mechanical Alloying

# Mechanochemical Synthesis

## → Preparation of mixed oxides

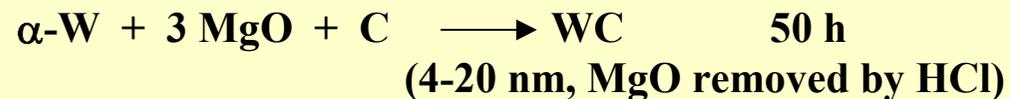

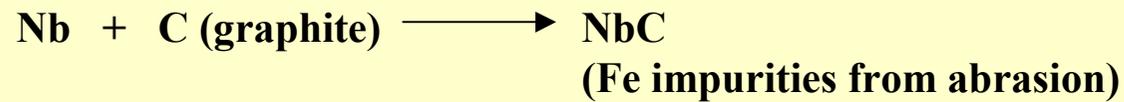

## → Preparation of chalcogenides

# Mechanochemical Synthesis

→ Preparation of carbides, borides, nitrides, silicides

# Mechanochemical Synthesis

→ Reactive milling

heating to 473 K for 4h to remove organics and calcination at 573-673 K in oxygen gives ITO

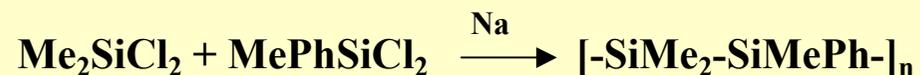

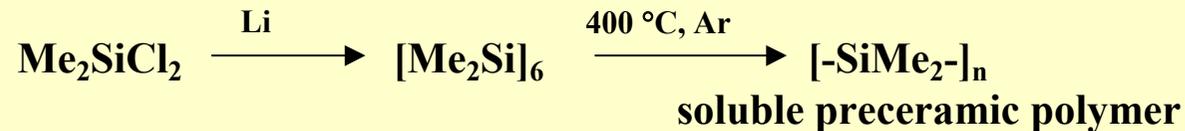

# Polymer Pyrolysis

**Preparation of:  
powders, monoliths, fibers, films, impregnation (PIP)**

**Example: SiC fibers**

☺ **polymer synthesis**

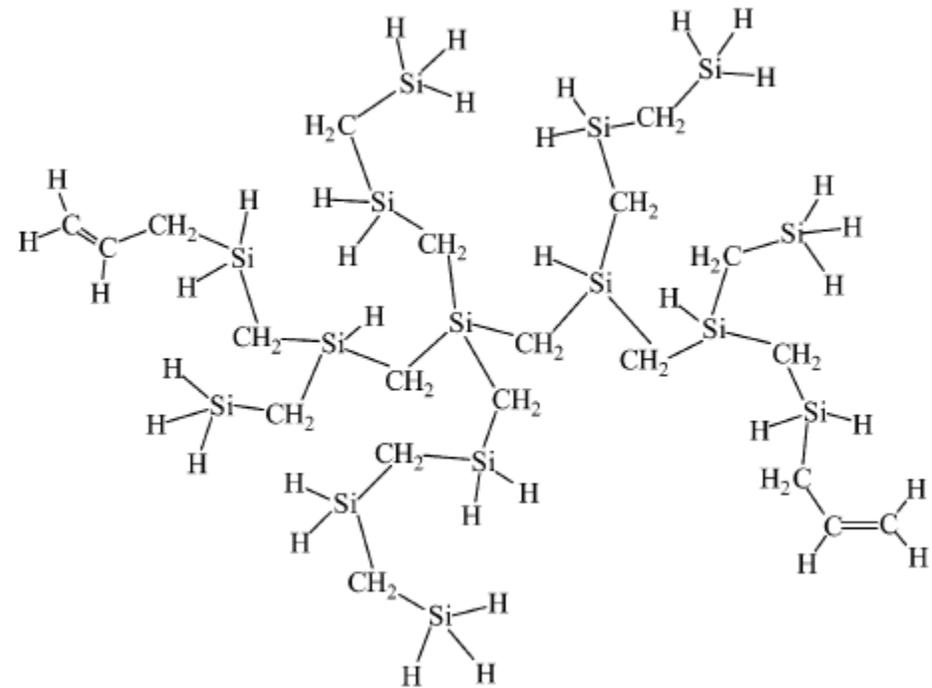

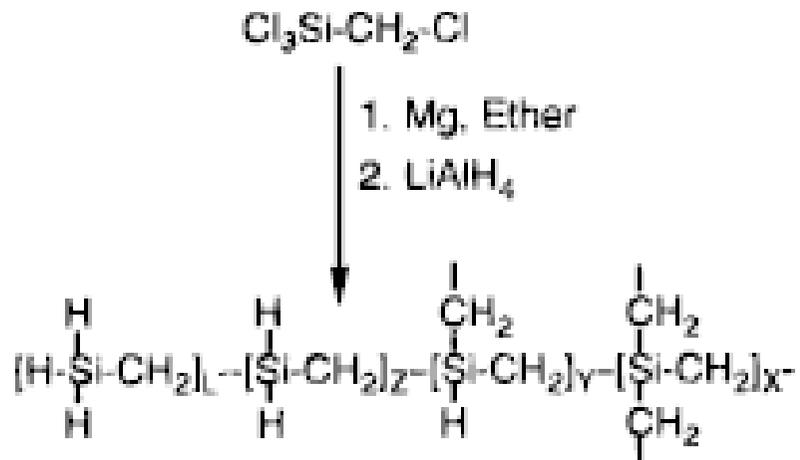

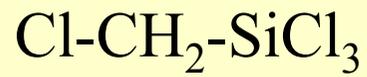

☺ **melt spinning or drawing from solution gives continuous polymer fiber**

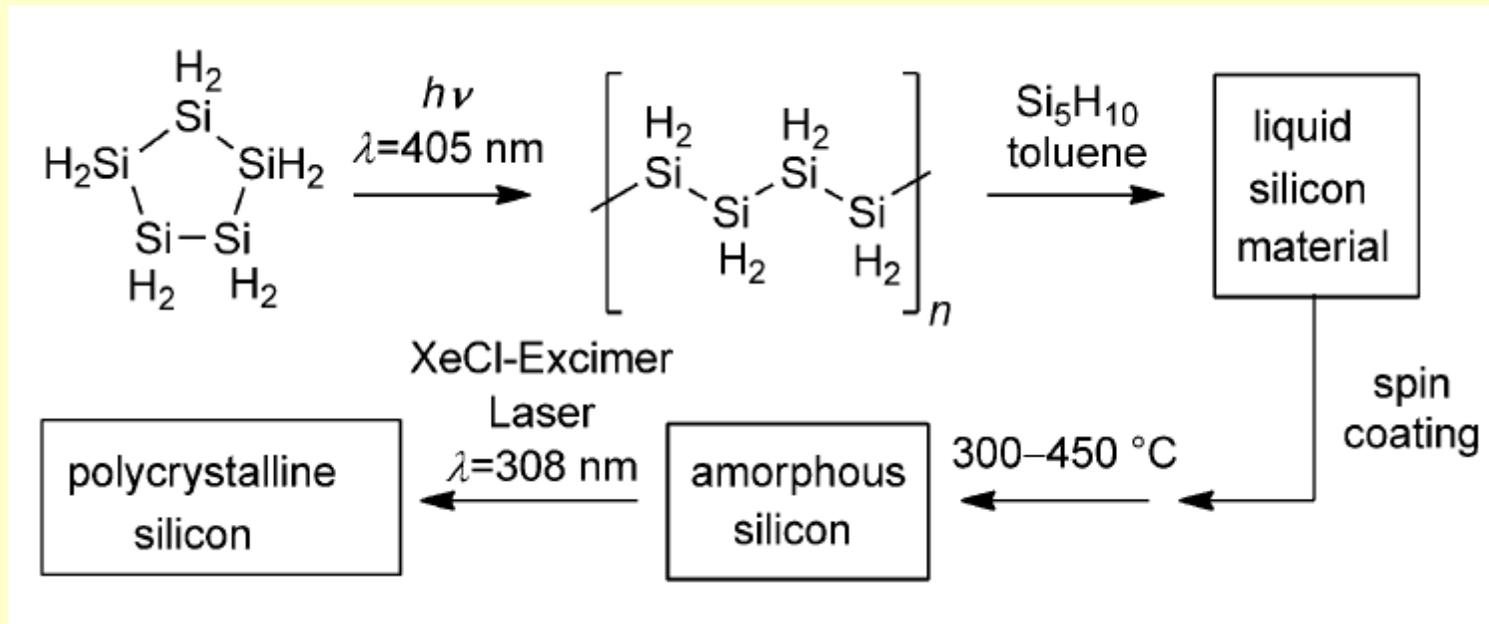

☺ **curing in O<sub>2</sub>, heat to 400 - 500 °C, thermoset, crosslinking to prevent melting**

☺ **pyrolysis at 1000 - 1500 °C to polycrystalline β-SiC fiber**

# Polymer Pyrolysis

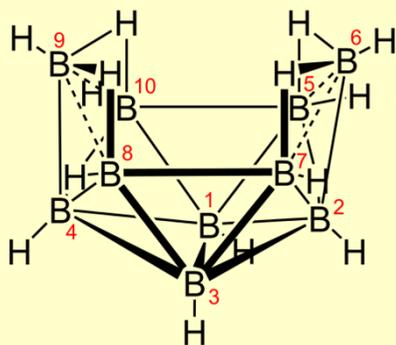

# Polymer Pyrolysis

**AlN**

## Thermolysis of Organometallic Coordination Polymers

thermolysis in Ar or H<sub>2</sub> gives intermetallics FeSn<sub>2</sub>, CoSn<sub>2</sub>, Ru<sub>3</sub>Sn<sub>7</sub>

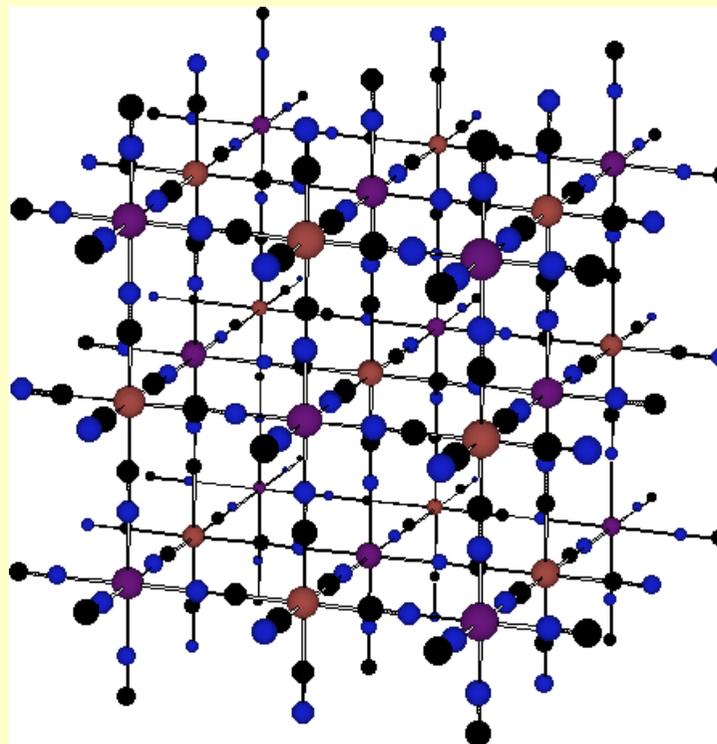

thermolysis in air gives oxides Fe<sub>2</sub>O<sub>3</sub>/SnO<sub>2</sub>, Co<sub>2</sub>SnO<sub>4</sub>, RuO<sub>2</sub>

# Thermolysis of Organometallic Coordination Polymers

$(\text{Me}_3\text{Sn})_n\text{M}(\text{CN})_6$   $n = 3,4$ ;  $\text{M} = \text{Fe}, \text{Co}, \text{Ru}$

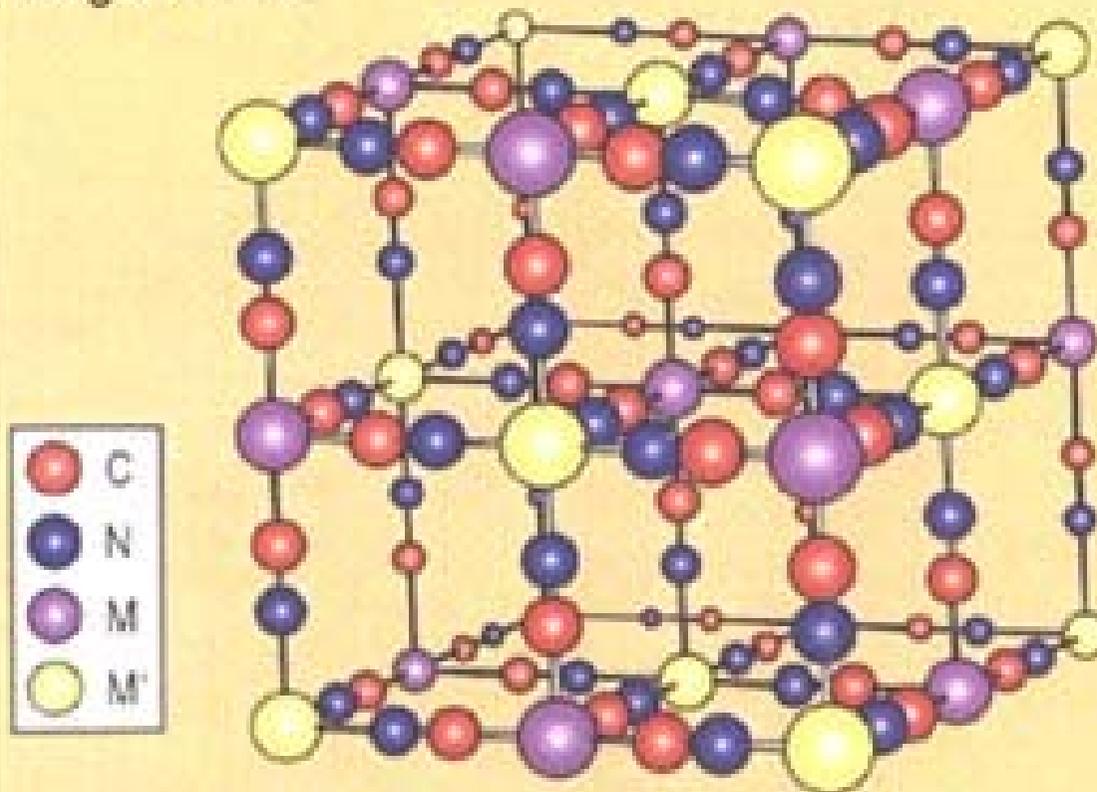

thermolysis in Ar or  $\text{H}_2$  gives intermetallics  
 $\text{FeSn}_2, \text{CoSn}_2, \text{Ru}_3\text{Sn}_7$

thermolysis in air gives oxides  
 $\text{Fe}_2\text{O}_3/\text{SnO}_2, \text{Co}_2\text{SnO}_4, \text{RuO}_2$

## Prussian Blue structure

An idealised structure of Prussian Blue with  $M \leftarrow C=N \rightarrow M'$  linkages in 3-D

When  $M = \text{Cr}$ ,  $M' = \text{Ni}$  material is a ferromagnet,  $T_c = 90\text{K}$   
When  $M = \text{V}$ ,  $M' = \text{Mn}$  material is a ferrimagnet,  $T_c = 125\text{K}$   
When  $M = \text{Cr}$ ,  $M' = \text{V}$  material is a ferrimagnet,  $T_c = 315\text{K}$

# Microwave-Assisted Synthesis

**Microwave radiation = electromagnetic radiation** **Microwaves:**

$\lambda = 1 \text{ mm to } 1\text{m}$ ,  $\nu = 0.3 \text{ to } 300 \text{ GHz}$

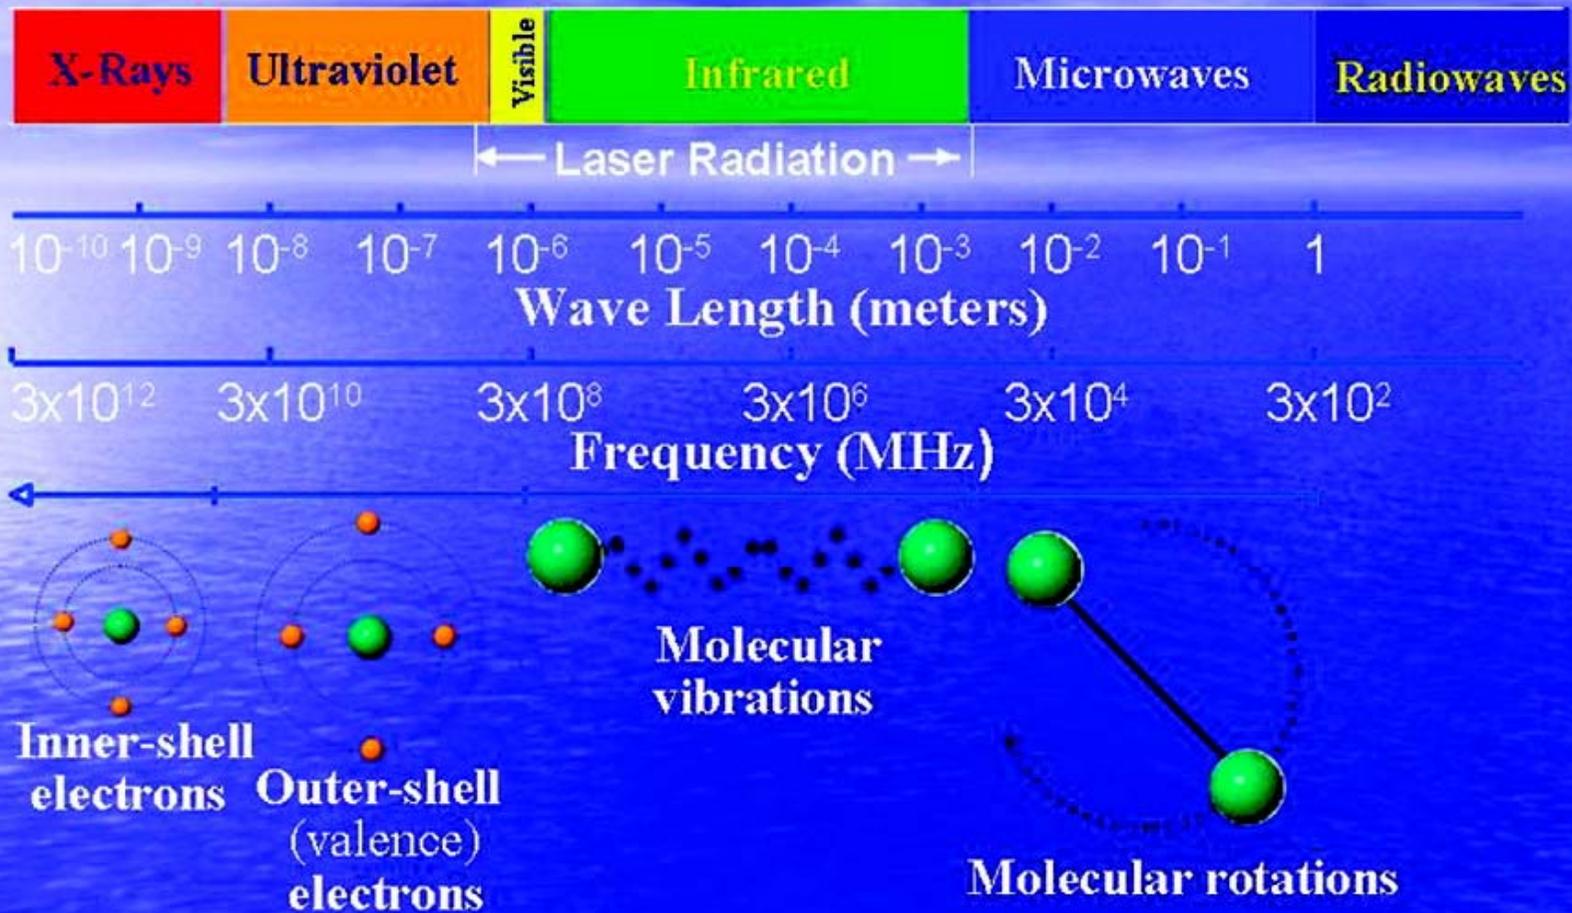

**Microwave ovens 2.45 GHz,  $\lambda = 12.24 \text{ cm}$**

**power up to 1 kW, pulses, magnetron, microwaveguide,  
microwave cavity**

**All kitchen microwave ovens and all microwave  
reactors for chemical synthesis operate at a frequency of 2.45  
GHz to avoid interference with telecommunication and cellular  
phone frequencies.**

# Microwaves in the Synthesis of Nanomaterials

# **Microwave-Assisted Synthesis**

**The energy of the microwave photon in this frequency region is too low ( $10^{-5}$  eV) to break chemical bonds lower than the energy of Brownian motion at 298 K**

**Microwaves cannot induce chemical reactions**

## **Microwave-enhanced chemistry**

**the heating of materials by “microwave dielectric heating” effects = the ability of a material (solvent or reagent) to absorb microwave energy and convert it into heat**

# **Microwave-Assisted Synthesis**

## **Dielectric heating**

**electric dipole reorientation in the applied alternating field**

**the dipoles or ions aligning in the applied electric field  
applied field oscillates, the dipole or ion field attempts to realign  
itself with the alternating electric field  
energy is lost in the form of heat through molecular friction and  
dielectric loss**

**if the dipole does not have enough time to realign, or reorients too  
quickly with the applied field, no heating occurs**

# **Microwave-Assisted Synthesis**

## **Resistive heating**

**polarization current, a reorientation phase lag**

## **Joule heating**

**ionic current, ionic conduction, ions drift in the applied field**

## **Electronic transport**

**metal powders, semimetallic and semiconducting materials**

**Rotational excitation: weak bonds (interlayer bonds in graphite and other layer materials)**

**Eddy currents: metal powders, alternating magnetic fields**

**Microwave absorption = f (frequency, temperature)**

**Thermal runaway = increased dielectric loss at higher T**

# Dielectric Properties

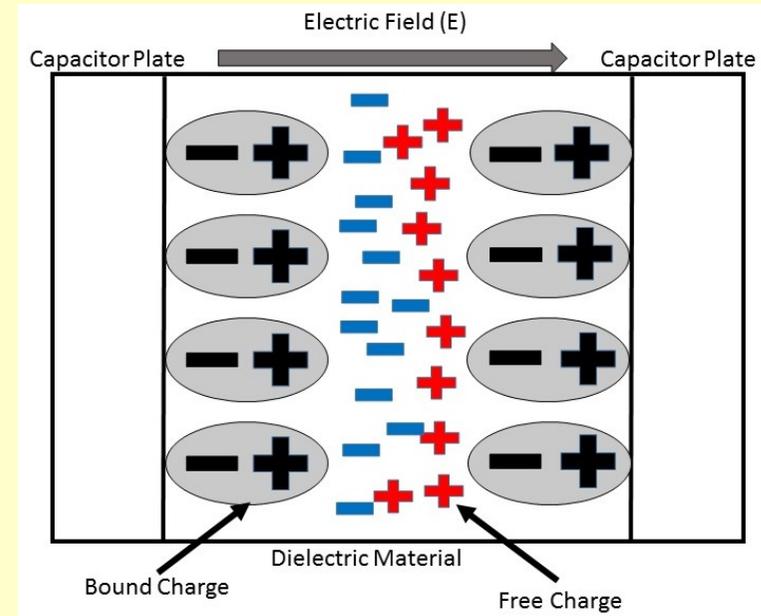

## Dipolar polarization, $P$

$$P = \epsilon_0(\epsilon_r - 1)E$$

$E$  = external electric field of strength  $E$ , potential (V)

$\epsilon_0$  = permittivity of free space

$\epsilon_r$  = relative permittivity of a material

$\epsilon^*$  permittivity is a complex quantity:  $\epsilon^* = \epsilon_0\epsilon_r$   $\epsilon^* = \epsilon' + i\epsilon''$

$\epsilon'$  = time-independent polarizability of a material in the presence of an external electric field

$\epsilon''$  = time-dependent component of the permittivity, quantifies the efficiency with which electromagnetic energy is converted to heat

# Dielectric Properties

**The ability of a substance to convert electromagnetic energy into heat at a given frequency and temperature**

**Loss factor  $\tan\delta$                        $\tan \delta = \varepsilon''/\varepsilon'$**

**$\varepsilon''$  is the dielectric loss, the efficiency of radiation-to-heat conversion**

**$\varepsilon'$  is the dielectric constant, the ability of molecules to be polarized by the electric field**

**a high  $\tan\delta$  value required for efficient absorption and for rapid heating**

## Loss factors ( $\tan\delta$ ) of different solvents (2.45 GHz, 20 °C)

Solvent	$\tan\delta$	Solvent	$\tan\delta$
ethylene glycol	1.350	DMF	0.161
ethanol	0.941	1,2-dichloroethane	0.127
DMSO	0.825	water	0.123
2-propanol	0.799	chlorobenzene	0.101
formic acid	0.722	chloroform	0.091
methanol	0.659	acetonitrile	0.062
nitrobenzene	0.589	ethyl acetate	0.059
1-butanol	0.571	acetone	0.054
2-butanol	0.447	tetrahydrofuran	0.047
1,2-dichlorobenzene	0.280	dichloromethane	0.042
NMP	0.275	toluene	0.040
acetic acid	0.174	hexane	0.020

**microwave absorbing properties**

**high**                       $\tan\delta > 0.5$

**medium**                     $\tan\delta 0.1-0.5$

**low**                          $\tan\delta < 0.1$

# Dielectric Heating

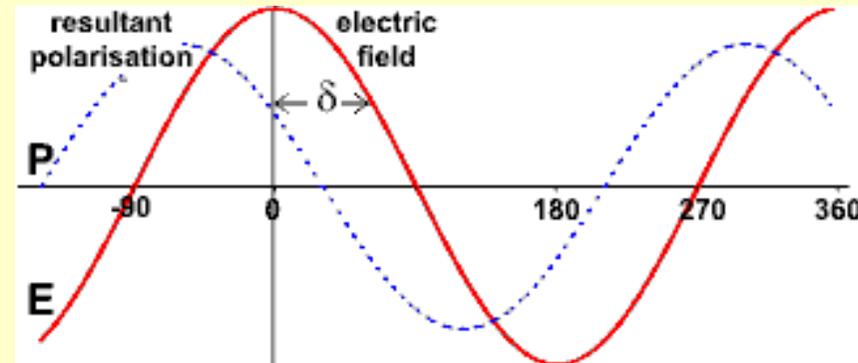

The applied field potential  $E$  of electromagnetic radiation

$$E = E_{\max} \cdot \cos(\omega\tau)$$

$E_{\max}$  = the amplitude of the potential (V)

$\omega$  = the angular frequency ( $\text{rad s}^{-1}$ )

$\tau$  = the time (s)

If the polarization lags behind the field by the phase ( $\delta$ , radians, phase lag) then the polarization ( $P$ , coulombs) varies as

$$P = P_{\max} \cdot \cos(\omega\tau - \delta)$$

$P_{\max}$  is the maximum value of the polarization

# Dielectric Heating

The current ( $I$ , A) varies as  $I = (dP/dt) = -\omega P_{\max} \sin(\omega\tau - \delta)$

The power ( $P$ , watts) given out as heat is the average value of (current x potential).

$P$  is zero if there is no lag (*i.e.* if  $\delta = 0$ ), otherwise

$$P = 0.5 P_{\max} E_{\max} \omega \sin(\delta)$$

The penetration depth,  $D_p$ , is the distance into the sample at which the electric field is attenuated to  $1/e$  of its surface value

$$D_p = \frac{\lambda \sqrt{e'}}{2\pi e''}$$

$\lambda$  = wavelength of the microwave radiation.

$D_p$  = several micrometers for metals and several tens of meters for low-loss polymers

# Microwave-Assisted Synthesis

## Interaction of materials with microwaves:

✦ reflectors: metals, alloys ( $\delta$  skin depth, large E gradients, discharges)

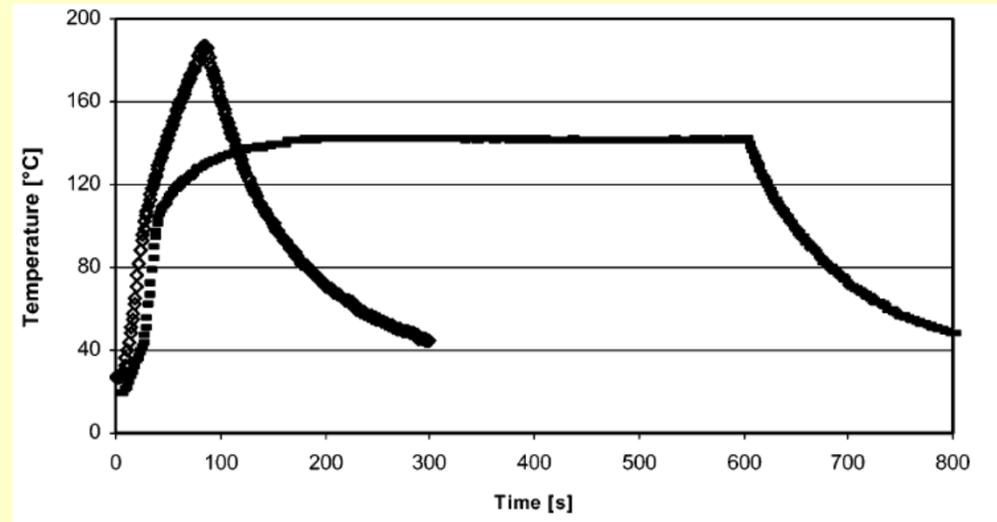

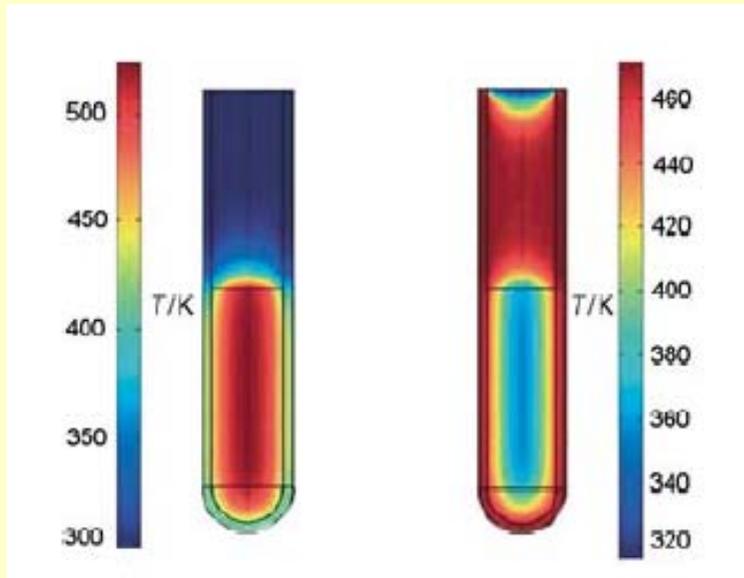

✦ transmitters: quartz, zircon, glasses, ceramics (TM free), Teflon

✦ absorbers: amorphous carbon, graphite, powdered metals, metal oxides, sulfides, halides, water

# Temperature Gradients

MW

Oil bath

Microwave heating profiles for  
 pure water (■)  
 0.03 M sodium chloride solution (◆)  
 at constant 150 W power

Solvent	T, °C	$\epsilon'$	$\epsilon''$	Skin, cm	$\tan \delta$

water	25	78	10.33	3.33	0.13

# Microwave-Assisted Synthesis

## Examples of Microwave-assisted syntheses

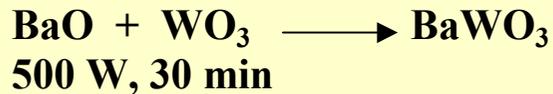

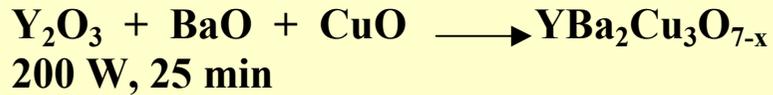

silica crucible, 1 kW, 4-10 min, 900 °C, inert ambient (I<sub>2</sub>),  
conventional process requires 1400 °C

metal + chalcogenide  $\longrightarrow$  ME evacuated quartz ampoules,  
5-10 min, 900 W, melting, light emission  
PbSe, PbTe, ZnS, ZnSe, ZnTe, Ag<sub>2</sub>S

Mo + Si + graphite  $\longrightarrow$  MoSi<sub>2</sub>  
high mp, oxidation and carbidation resistance, metallic conductivity,  
heating elements and high-T engine parts

# Microwave-Assisted Synthesis

**Mixed oxides**

**Amorphous carbon is a secondary susceptor, does not react with reagents or products (carbothermal reduction)**

**C burns and initiates decomposition of carbonates or nitrates**

**NaH<sub>2</sub>PO<sub>4</sub>·2H<sub>2</sub>O good MW susceptor, rotational excitation of water, dehydrates to NaPO<sub>3</sub>, melts, 700 °C in 5 min**

**Na<sub>2</sub>HPO<sub>4</sub>·2H<sub>2</sub>O, KH<sub>2</sub>PO<sub>4</sub> no MW heating**

### Microvawe-Active Elements, Natural Minerals, and Compounds (2.45 GHz, 1 kW)
